ACADEMIC ENTREPRENEURSHIP AS AN IMPORTANT FACTOR OF SUSTAINABLE ECONOMIC DEVELOPMENT

Alijan Abbasov

Azerbaijan State Economic University, Azerbaijan
alican.abbasov@gmail.com

ABSTRACT

The article reveals the essence and importance of academic entrepreneurship as an important factor in sustainable economic development. The emphasis was placed on the growing role of academic entrepreneurship in all academic personnel and in all economic subjects of innovation activity. The article studies the research and innovation activities of universities in developed countries, as well as innovative enterprises as subjects of academic entrepreneurship, as well as their problems in the process of formation and functioning. Modern universities also take on the mission of presenting the results of their research and business activities to the business environment, in addition to education and basic research, and also turn scientific research laboratories and community centers into economic actors that play an important role in the innovation process. The actions of key participants, such as pioneers, innovators and investors involved in the implementation of innovations in the field of commercialization of university innovations, as well as the close relationship of the concept of commercialization with market relations were reviewed. In order to achieve high technological results in the innovation sector, the issues of attracting potential investors and public funding of universities were considered. To assist small innovative enterprises, the urgency of the creation of business incubators and investment institutions by the state is justified. The issues of improving the financial policy mechanism for the development of academic entrepreneurship, especially improving the lending and taxation system, stimulating innovation, expanding the intermediate function between state universities, research organizations and industrial companies were carefully studied. Substantial proposals and recommendations for improving the methods and forms of commercialization of results and innovation of university research are provided.

Keywords: *academic entrepreneurship commercialization of innovations, small innovative enterprise*

1. INTRODUCTION

Ideas about higher education, society, entrepreneurship, and the state are undergoing major changes in the globalizing world economy, and universities are seen as the center for the systematic integration of innovation activities in the country. Universities engaged in the development and commercialization of new knowledge and technologies receive additional sources of income, and the innovations they introduce satisfy the needs of consumers. As a means of commercializing the results of university research, academic entrepreneurship transforms new knowledge into innovations, products, services and processes. Academic entrepreneurship plays an important role not only among academical staff involved in research and the commercialization of their results, but also in all economic subjects of innovation activity. Strengthening the innovative potential of universities in the post-industrial age is necessary for the future integration of science and the real economy, the development of the state and society. It is expected that universities will contribute to the sustainable development and competitiveness of the national economy through innovation.

2. INNOVATION AS A PRIORITY DIRECTION OF UNIVERSITIES

Innovative development of academic entrepreneurship is one of the most vital social and economic problems of sustainable development. An important pattern of sustainable development is inequality due to the consistent replacement of technological systems. The basis of the theory of changing technological systems and their replacement by new generation technologies is the concept of long-term cycles N. D. Kondratieva and I. Shumbetrin's hypothesis, which reflects the interaction between entrepreneurship and long-term movement in the development of technological innovations. The innovative technology of the sixth technological system - NBIC technology, based on the technological convergence of nano-bio-information and cognitive technologies, will become a sustainable source of economic growth and competitiveness of developed countries due to the strong synergy effect. Innovations in the developed countries of the world, which are leaders in the field of research and development of NBIC technology, provide 80-90 percent of GDP growth [1, p.215]. Recently, there have been positive trends in science in higher education. This is due to the increase in state support for universities and the need to commercialize the results of their research. If universities are passive and do not interact with state-owned enterprises, they may lose reputation and access to financial resources in the eyes of the business community and cannot actively participate in international educational and scientific cooperation, which could lead to divergence of potential college candidates and future problems. Universities in developed countries of the world are turning into leading research centers whose goal is not only to train highly qualified specialists, but also to stimulate innovation and the application of innovation. Leading universities unite with business structures for creation of a chain of innovations. For example, in the United States the University of Maryland has an industry engagement program which accelerates process of commercialization of innovative technologies by joint financing of research and development by the university and the industry.

2.1. The role of academic entrepreneurship in the innovative development of the economy

With the globalization of the world economy in the higher education system, major changes are occurring, as in other areas, it is assumed that universities are directly involved in the development of entrepreneurial activity based on innovation. As a result of the commercialization of large scientific and technical potential collected at universities, it is possible to obtain additional sources of income. This can be achieved through the development of academic entrepreneurship, which is the means of commercialization of knowledge. For the development of academic entrepreneurship, it is important to create small innovative enterprises in higher education institutions that turn their knowledge into innovations, services, products and processes. The phenomenon of academic entrepreneurship plays an important role not only among the teaching staff engaged in research and commercialization, but also in all economic actors of innovation. For the first time, American companies were engaged in academic entrepreneurship in the 70s of the 20th century, and its formal formation has coincided with the adoption of the Bayh-Dole Act in 1980. This law allowed universities to patent their inventions, and also granted ownership of their research and technology. In the 80s of the 20th century, universities in European countries began to commercialize the results of their research work. Commercialization is the process of transforming the fundamental knowledge gained from business activities in universities into innovative products. The basis of these processes are fundamentally new functions assigned to universities. Universities also take on the mission of presenting the results of their research and business activities to a business environment, in addition to education and basic research. Research laboratories and social centers are becoming economic actors that play an important role in the innovation process. Thus, universities become researchers and consultants and turn into a full-fledged market participant, which led to the creation of small innovative enterprises.

In industrialized countries, universities, in addition to performing their traditional functions, successfully implement the commercialization of the results of their research work. At the end of the 20th century, academic entrepreneurship became more prominent in European countries, since the commercialization of the results of scientific and technical activities allowed universities to generate additional income. A large number of studies on the development of academic entrepreneurship have been implemented and published in European countries. In economically developed European countries, talented students work in small innovative enterprises, in which they transform their knowledge gained by them in the learning process, into various innovative technologies and projects. Leading research universities in the world have specialized offices that help academic staff and students wishing to engage in academic entrepreneurship. These offices offer technological equipments and jobs, and also form a team for the implementation of innovative projects. They then look for an investor and assist in launching a small innovative enterprise and patenting acquired inventions, as well as provide necessary advice and answers to questions during the project implementation stages.

2.1.1. Principles for the commercialization of university innovations

Attracting potential investors or public funding of universities are crucial to achieving high technological innovation results, as universities often do not have special funds for research and development of new technologies. To support small innovative enterprises, the state should create business incubators and investment institutions, as well as make changes and amendments to the legislation. All this is crucial for protecting and increasing the interest of students and teachers in the development of academic entrepreneurship, since small innovative enterprises have significant advantages in the development of an innovative economy of the country. The development of small innovative enterprises allows universities to benefit from the material resources and capabilities of industrial companies. In addition, joint research with industrial companies improves the status of universities. The process of commercialization of innovations in higher education requires the joint participation of several actors. The main actors in this process are pioneers, innovators and investors. In the process of commercializing innovation, universities are pioneers and sources of scientific work, industrial companies play the role of innovators, and state and commercial banks, credit institutions and venture capital funds perform the functions of an investor. Joint participation in the commercialization of innovations leads to certain contradictions in their interests. That is why the commercialization of innovations in higher education requires a balance of interests of all participants. Considering that the concept of commercialization is closely related to market relations, we can say that the basis of the concept of market and commercialization is the same. Market relations are based on free enterprise, competition and the allocation of resources, pricing, determining the balance of supply and demand and the protection of property rights by the state. Therefore, without market relations, the concept of "commercialization" loses its essence. Research centers and universities play an important role in the innovative development of the economy.

3. IMPROVING THE MECHANISM OF MANAGEMENT OF ACADEMIC ENTREPRENEURSHIP IN UNIVERSITIES

Universities support the development of the country's economy in the following directions [2, p.139].

- universities are considered the basis of basic scientific research, creating the conditions for technological, social and economic development of the country;
- researches are conducted in universities of the applied direction and intermediate structures are created for their introduction into the industry (technoparks, business incubators);

- university research is an important part of the process of training scientific personnel and increasing the scientific and pedagogical potential of the country;
- universities often become a "pole of attraction" of high-tech industries to their countries.

In world practice, there are various mechanisms for the application of innovations. Analyzing the features of the innovation policy of foreign countries, the Russian economist Natalya Shelyubskaya concluded that their innovation policy was aimed at promoting clear scientific and technical cooperation [3, p. 24]. The state often plays the role of an intermediary between research organizations, universities and companies. Various structures are being created, such as a university and industrial cooperative center, an innovation center for the introduction of new technologies for small and medium-sized businesses, and a center for the commercialization of inventions. To implement the results of scientific research is usually used mechanism of technology commercialization using organizational structures of business entities. Scientific studies show that countries with a high level of innovation interaction between universities and industrial enterprises occupy leading positions in the Global Competitiveness Index of the Davos World Economic Forum. The analysis of the works devoted to the problems of innovative development of the economy leads to the conclusion that there are general trends in innovation policy in different countries of the world. For example, in all countries of the world, direct and indirect methods of stimulating innovation are used, which, in turn, corresponds to the structure as a whole. There is a cluster approach to the formation of general trends in the innovation policy of foreign countries. American philosopher Michael porter (1947), the founder of cluster theory, first described the cluster in his work "Competition". A cluster is a geographical concentration of interconnected enterprises, specialized suppliers, associated institutions in a particular field, as well as organizations that are competitive in certain areas and at the same time work together on their activities [4, p.485]. The creation of clusters accelerates the process of economic growth in some areas, which leads to the growth of innovative activity and competitiveness of the country. The experience of foreign countries has shown that the functioning of several groups of sectors in the interaction within clusters leads to an increase in employment, a large amount of investment and accelerated use of innovative technologies in the national economy. Since 2005, industrial areas, industrial parks and agroparks have been created in many cities and districts of the Republic of Azerbaijan; serious work is being done towards clustering and diversifying the national economy. The development of academic entrepreneurship requires the formation and development of a national innovation system. Some steps were taken to form a national innovation system in the Republic of Azerbaijan, the Scientific Innovations Center of the National Academy of Sciences of Azerbaijan and the Foundation for the Development of Science were created, and legislative and regulatory acts regulating innovations were adopted. Financing of innovation activities should be carried out at the expense of the state budget and the local budget, special funds of enterprises, extra-budgetary funds and venture capital. To implement an active innovation policy, it is necessary to take measures to improve fiscal policy, in particular, to improve the system of crediting and taxation and to stimulate innovation activity. Experience shows that modern high-tech production can be based only on horizontal, diagonal and vertical integration processes. Profound economic progress can be achieved not by scattered enterprises, but by their mergers and groupings through clusters and networks. The inclusion of universities in the cluster provides a competitive advantage for the country, that is, investors can simultaneously invest in the real economy, as well as education and research. A distinctive feature of such clusters is their innovative orientation. An innovation cluster is a set of services that provides interaction between independent enterprises, such as universities, knowledge-based enterprises, science and industry, and also supports organizations and consumers who participate in joint innovation activities.

Various innovative structures have been created at universities in the USA, Canada, Great Britain, Japan, and other countries that contribute to the innovative development of the national economy. At the present stage of the Azerbaijani economy, higher education institutions are considered as a center for the systematic integration of the country's innovative activity. Innovation activities of higher education institutions, understood as activities aimed at the development and commercialization of new knowledge and technologies, are considered as their main directions of development. Innovations carried out by institutions of higher education lead to the satisfaction of the demand of local and foreign consumers. In addition, strengthening the innovative capacity of higher education institutions is important for the future integration of science and the real economy, as well as the sustainable development of the state and society in the post-industrial era. In accordance with the State Strategy for the Development of Education in the Republic of Azerbaijan, the restructuring of the higher education sector is aimed at developing research and development in universities, deepening cooperation between universities, leading companies in the real economy and academic institutions, and expanding international integration of universities in Azerbaijan in the field of research and development, strengthening academic mobility and the development of a network of educational and research programs are the main priorities of higher education. Thus, financial support from the government to leading universities, research groups and other scientists participating in research at the international level will increase, and the practice of providing benefits to small innovative enterprises that will allow commercialization of intellectual property in universities will continue. Currently, universities are developing innovation performance management systems, developing criteria for evaluating innovations and proposing various methods and tools for its development. As a rule, the organization of innovation in higher education involves the integration of research centers of universities and industrial companies, so that academic staff who participate in research can commercialize the results of their work as soon as possible. Today, the most urgent task is to create innovation centers, incubators, special educational, scientific and innovative complexes at universities. Thus, the innovative activity of higher educational institutions is one of the main factors for the successful modernization of the economy of Azerbaijan. Modern universities are considered as subjects of economic activity. Currently, various structural units of higher education institutions have the opportunity to realize and commercialize their innovative potential. In order to improve the process of managing innovations in the conditions of free market relations, it is necessary to improve the management methods of the university, taking into account its characteristics. At new stages of education, universities successfully competing in the global market for educational services are transformed into an open innovation system.

4. CONCLUSIONS

There is a trend in the world towards a knowledge-based society and economy. Small innovative enterprises, which are one of the key organizers of this process, play an important role in the development of academic entrepreneurship in higher education institutions. However, the Azerbaijani authorities are not taking effective measures to stimulate academic entrepreneurship.

- Innovative activity of higher educational institutions is one of the main factors for successful modernization of the country's economy. Modern university is considered as a subject of economic activity. Structural subdivisions of the university have the opportunity to realize their innovative potential, they receive additional funds from the commercialization of their research results.
- The system of financing university science should be flexible and have many sources; it is necessary to eliminate regulatory barriers that prevent the integration of education with the

real sector of science and economics. In terms of market relations, it is necessary to improve the methods of university management taking into account the peculiarities of innovation. It is important to actively promote the partnership of business with science and education.

ABSTRACT

Sustainable economic development brings about economic growth as a result of increased incomes in the country. Entrepreneurship plays an important role in the context of sustainable economic development. This role, which incorporates production, labor, capital and technology, combines assessment and risk and sets out a strategic framework for economic regulation and development. Entrepreneurship spirit is the key element of sustainable economic development in the country. The growth and prosperity of those elements are also the driving force of the economy. The impact of economic development on the entrepreneur takes a special place in promoting sustainable economic development by promoting entrepreneurs' innovation and innovation through competitiveness, promoting employment, opening up business opportunities, expanding production and commercial activities, inventions, scientific research and discoveries. Therefore, promoting a competitive environment in the business environment and boosting state-of-the-art support for increasing the volume of production are considered to be topical issues in ensuring sustainable economic development. The article analyzes the complex mechanism of sustainable economic development based on theoretical and practical approaches. The modern state of the economy of the Republic of Azerbaijan as the object of research was taken as a basis. The purpose of the research is to examine the methods of balanced economic development, based on macro and microeconomic analysis. The novelty of scientific research is to identify the features of economic relationships, and to identify areas for effective economic development strategies based on program- targeted management.

Keywords: *sustainable development, development concept, program-targeted management, state development strategy*

1. INTRODUCTION

“Sustainable Development” – is a developmental approach that does not endanger the demands of future generations, while meeting the demands of the present time. [1] Here are two key concepts:

- understanding the different needs that will be the primary priority, especially the needs of the poorest populations;
- understanding the limitations imposed on the ability of the society to meet current and future environmental requirements conditioned by technological and organizational status.

There are also short conclusions reflecting some important economic aspects of sustainable development. Among such definitions are the following:

- development that does not overwhelm additional costs for future generations;
- adversely affecting the generation, minimizing external influences;
- progressive or expanded permanent reproduction of production potential in perspective.

It is possible to distinguish between the generations of modern generations and the ecological-economic aspect, which emphasizes the social aspect, the problem of poverty, when it comes to the prerogatives of the economic relations of the generations. The goal of a sustainable economic development concept is to combine three main objectives in a single, economic, social and environmental environment.

The global nature of the concept of sustainable development, the collapse of the most complex environmental, economic and social problems in the so-called concept, is even revealed in the above brief description [2, p. 231]. Program-targeted management in sustainable economic development begins with the precise identification and implementation of end-to-end goals. These goals make the usual desirable situation. The management system should move from the given situation to the same situation after a period of time after a number of problems that separate the situation from the desired situation. [3, p. 33] By reviewing the "programmatic management" approach, it would be desirable to make a conclusion about the quality, in other words, the direction in which the desired changes were made. The purpose of sustainable economic development is to provide not only the present generation of the country, but also the welfare of its future generations. [4, p. 21]

2. OVERVIEW OF ECONOMIC SUSTAINABILITY CONCEPTS IN AZERBAIJAN

The priority of the socio-economic policy of Azerbaijan is the human factor, its concerns welfare, health and safety. This once again shows that the Azerbaijani economy is socially oriented. Regarding the application of term "sustainable development" it should be noted that, the term was mentioned for the first time when a speech was delivered by the UN Commission for Environment and Development, headed by Mrs. Gro Harlem Brundtland, the former Prime Minister of Norway in 1987, entitled "Our Common Future." During the speech, issues such as further aggravation of "nature-society" relations, the world's population outgrowth and poverty, the problem of drinking water and food, the demographic explosion, deteriorating people's material well-being and living standards, increase of frequency of natural disasters, exhausting natural resources and energy resources, extension of social inequality among countries, and etc. were substantiated. The purpose of this report was to develop a sustainable development concept, which is based on the social, economic and ecologically normal payment of the living needs of today's generations, without endangering their lives, without endangering the lives of future generations. The state acts as the main provider of economic security. In accordance with the current legislation, the state ensures the security of every citizen in the territory of the Republic of Azerbaijan, social and legal protection of public associations and organizations. Sustainable economic development paradigm implies that the sustainable and decent well-being of the human community is determined by the economy, the social sphere, and the environment. In societies, where only macroeconomic indicators are improving, it is still insufficient to speak about sustainable economic development. Classification of Sustainable Economic Development Concept:

- global (mega) level – the world's sustainable economic development;
- regional level – sustainable economic development of the -world region;
- macro-level – the country's sustainable economic development;
- local level – Sustainable economic development of the localized country-specific region;
- meso-level – sustainable development of the country's economy;
- micro-level – a sustainable development of a separate enterprise;
- universal – suitable for all situations.

Our country is closely involved with the UN's global development initiatives. The Millennium Declaration was adopted at the UN Millennium Summit in New York, USA, in 2000. This Declaration identifies Millennium Development Goals (MDGs) for countries around the world by 2015. The declaration consists of 8 sections and 32 items. Millennium Development Goals are as follows:

- eradication extreme poverty and hunger;
- achievement universal primary education;
- ensuring gender equality and empowering women;

- reducing child mortality;
- improving maternal health;
- combat against HIV/AIDS, malaria and other diseases,
- ensuring environmental sustainability;
- expansion of global partnership for sustainable development.

3. IMPROVEMENTS ON ACHIEVEMENT OF THE GOALS OF MILLENNIUM ECONOMIC DEVELOPMENT IN AZERBAIJAN

“The State Program on Poverty Reduction and Economic Development in the Republic of Azerbaijan for 2003-2005”, as well as “the State Program on Poverty Reduction and Sustainable Development in the Republic of Azerbaijan for 2008-2015”, aimed at implementing complex measures to combat poverty in our country, which joined the Millennium Declaration, have been prepared, approved and successfully implemented. Azerbaijan has achieved significant milestones in Millennium Development Goals over the past few years, particularly in promoting people’s health, improving the environment, poverty eradication, raising the level of education of the population, promoting and ensuring gender equality. Increasing the purposefulness and effectiveness of social policy, including the improvement of the social protection system and the targeted state social assistance program, has enabled to eliminate excessive poverty in the country and reduce the absolute poverty level of 49% in 2001 to 4.9% in 2015 reported. [2] The negative processes taking place in the world economy and the decline in exports in consequence of decrease of oil prices have affected both the economy of Azerbaijan and the level of poverty. As a result, there was a slight increase in poverty in 2016, but the timely preventive measures have justified themselves. At present, the poverty rate is 5.9%. Let’s take a view to the achievements of our country on Millennium Development Goals:

Table following on the next page

Table 1: Millennium Development Goals

Goals	General results acquired
Goal 1: Overcoming poverty and hunger	Hunger and poverty are already not actual for Azerbaijan. Therefore, the policy is aimed to reduction of absolute poverty level. According to SSC HBSS (State Statistics Committee Household Budget Selection Study), the absolute poverty level within the country decreased from 49.0 % to 4.9 %, and the extreme poverty level dropped to an unacceptable level (<0.1) throughout 2001-2015.
	The share of the poorest quintile in consumption increased from 12.2% in 2003 to 15.4%. The share of children under age 5 decreased from 6.8% in 2001-2015 to 0.6%
Goal 2: Providing access to general primary education	The Republic of Azerbaijan has already achieved this goal. Although the country has high indicators in this area, the relevant figures have improved at certain degree in recent years.
	Literacy levels between the ages of 15-24 have been risen to 100% and have been the same for men and women throughout 2000-2015.
	The net enrollment ratio in primary education has risen to 99.8%. Among men, the figure rose to 99.9 per cent and 99.7 per cent to women throughout 2000-2015.
	The percentage of primary school graduates over the years has increased from 92.8 to 100%. Among men, this indicator increased to 100 per cent and 99.9 per cent to women throughout 2000-2015.
Goal 3: Gender equality and empowerment of women	Certain progress has been achieved in the sphere of gender equality for the targets set
	The unemployment rate among women has dropped by more than 2 times and dropped from 12.7% to 5.9% throughout 2000-2015.
	The unemployment rate among women has dropped by more than 2 times and dropped from 12.7% to 5.9% throughout 2000-2015.
	The number of seats held by women in the Parliament has risen from 10.7% to 16.8% throughout 2000-2015.
Goal 4: Reducing child mortality rate	Mortality rate among children under 5 (for every 1000 viable births) has dropped from 30.5% to 13.3% throughout 2000-2015.
	Infant mortality rate (per 1000 viable births) has dropped from 16.4% to 11.0% throughout 2000-2015.
	Level of vaccination of children against measles aged 1 year was 98.1% throughout 2000-2015.
Goal 5: Improving maternal health	The maternal mortality rate (every 100,000 live births) has fallen from 37.6% to 14.4% throughout 2000-2015.
	The proportion of births that have been received by a qualified healthcare professional has increased from 92.1% to 99.8% throughout 2000-2015.
Goal 6: Combat against HIV/ AIDS, malaria and other diseases	As of the end of 2015, 5629 people were registered in the Republic of Azerbaijan, and 5439 of the citizens of the country were registered with HIV / AIDS infection, the share of the population living with HIV is 0.06%.
	Cases with malaria contamination (per 100,000 population) dropped from 19.4 to 0 throughout 2000-2015.
	Cases with tuberculosis contamination (per 100,000 population) decreased from 178.6 to 101.1, the recording factor decreased from 64.3 to 41.9, and mortality from 14.9 to 5.1 throughout 2000-2015.
Goal 7: Providing environmental sustainability	As a result of continuous forestation and forest regeneration measures accomplished throughout 2000-2015, the forest area has been at 12.0 per cent of the country's total area. At the same time, the proportion of the area of specially protected natural areas, which aims to preserve biodiversity, has increased more than 2 times from 5% to 10.3% (from 4298.6 km ² to 8925.5 km ²).
	The percentage of people with access to fresh water sources reached 89.2% in 2015.
	The share of the population with access to improved sewerage services increased by 94.3% in 2015.
	The relocation of people living in the country (including normal housing and sanitation services), particularly for residential premises for normal living conditions, for the purpose of renovating such places and for living Still, work is still being done in the direction of laying and cleaning the dumps. As a result, the proportion of refugees and internally displaced persons living in "useful" areas for living has increased to 60.0% in 2015.
Goal 8: Developing a global partnership for the sake of progress	The number of internet users per 100 people has risen from 8 to 77 people throughout 2000-2015.
	The amount of individual computers per 100 people has risen from 15.0 to 69.9 pieces throughout 2000-2015.
	The ratio of wired telephone lines per 100 people has risen from 10 to 16 throughout 2000-2015.
	The amount of mobile phone numbers per 100 people has increased from 5.3 to 112 pieces throughout 2000-2015.
	The unemployment rate among the youth (15-24 years) has been reduced from 22.0 to 13.4% throughout 2000-2015. Among the women this figure dropped from 25.4 % to 15.8 %.

Source: Voluntary Statement on the initial steps taken by the Republic of Azerbaijan to implement the Sustainable Development Agenda until 2030. [4; p. 13-15]

3.1. Achieving sustainable development goals

Azerbaijan continues to actively participate in the global challenges of the UN.

Thus, Azerbaijan has been ratified by UN member states for the period 2016-2030 at the United Nations Summit on Sustainable Development in New York, September 25-27, 2015 and officially entered into force in January 2016 Sustainable Development Goals. The Azerbaijani state has also joined the “Transformation of our world: The Agenda of Sustainable Development until 2030”, which combines the purpose of the 17th and the 169 goals set out for these purposes. The set goals and targets are based on the Millennium Development Goals, which cover the economic, social and environmental aspects of sustainable development, and identify the next development goals. Let’s look through the Sustainable Development Goals:

1. elimination of poverty – end all forms of poverty everywhere;
2. eradication of hunger – hunger, achieve food security and nutritional quality improvements and promote sustainable agriculture;
3. good health and well-being – providing healthy living and promote the well-being of everyone at all ages;
4. quality education – promoting inclusive and equal quality education and promoting lifelong learning opportunities for everyone;
5. gender equality – achieving gender equality and empowering all women and girls;
6. clean water and sanitation – ensuring access and sustainable management of water and sanitation for everyone;
7. good and clean energy – providing everyone with affordable, reliable, durable and modern energy;
8. decent labor and economic growth – promotion of sustainable, inclusive and sustainable economic growth, full and productive employment and decent work for everyone;
9. industry, innovation and infrastructure – building a strong infrastructure, promoting inclusive and sustainable industrialization, and encouraging innovation;
10. inequality reduction – reducing inequality in and out of dominance;
11. sustainable cities and communities – making cities and settlements inclusive, safe, stable, and sustainable;
12. responsible consumption and production – providing sustainable consumer and production models;
13. fight against climate change – taking immediate action to combat climate change and its effects;
14. marine ecosystem protection – marine ecosystem protection;
15. soil ecosystem conservation – protection, restoration and promotion of sustainable use of land ecosystems, sustainable forest management, combating desertification and prevention and restoration of soil degradation, stopping biodiversity loss;
16. peace, justice and effective institutions – promoting peaceful and inclusive societies for sustainable development, ensure justice is accessible for all and create effective, responsible and inclusive institutions in all stages;
17. strengthening partnerships for goals and targets global partnerships for sustainable development.

The main objective of the President of the Republic of Azerbaijan is “Azerbaijan 2020: A Look into the Future” Development Concept, aimed at achieving high social welfare through sustainable socio-economic development on the basis of progressive world experience taking into account the country's socioeconomic resources in the long run, targeted state programs, specific action plans, complex and sustainable economic reforms have created a legal and economic basis for innovative, knowledge-based economy formation, diversification of exports, maximizing dependence on imports, enhancing business environment, attracting investment and other important work [5]. “Strategic Road Map on National Economy and Major Sectors of the Economy” has been approved by the Presidential Decree of December 6, 2016

to ensure the sustainability of economic policies and reforms implemented in the country. Strategic road maps that provide a qualitatively new model of economic development include a long-term vision for the period from 2025 to 2025 and a target view of the period from 2025 to 2025. This important document identifies key areas of development from agriculture to industry, as well as human capital development and further improvement of the business environment. [5, p. 7] As a consequence of systematic and preventive measures, the Azerbaijani economy has sufficiently prepared for the onset of the ongoing global economic crisis, which began in 2008 and later, in spite of the high investment risks in the crisis and the impact of the devaluation wave in the neighboring countries, Azerbaijan has pursued a rational macroeconomic policy, created foreign exchange reserves have played a significant role in managing financial risks in a predetermined mode. [6, p. 128]

3.2. Statistical results on achievement of socio-economic development

Statistical indicators once again confirm the development and sustainability of the Azerbaijani economy. In short, let's look at some of the indicators for 2017:

- unemployment rate – 5.0%.
- poverty level – 5.4%.
- number of the new workplaces opened – 221.000, 177.000 out of it permanent jobs.
- nearly 2 million jobs have been opened since 2004.
- the number of families receiving targeted social assistance – 116.000, covering more than 400.000 people.
- the amount of social assistance per family – AZN 150.
- number of newly constructed schools – 133.
- 93% of the country's gas was gasified.
- the positive balance of trade balance is USD 6.2 billion.
- compared with the previous year in 2017: an increase in the non-oil sector - by 2.5%; non-oil sector in industry - 3.6%; agriculture - 4.1%; export - 19%; non-oil exports - 24%; import-1%. [5]

It should be noted that as a result of the work carried out in order to further improve the investment climate, along with the number of companies investing in Azerbaijan, their geography is also expanding. It is known that investors are interested in investing in a stable country. Altogether, the economy of Azerbaijan has invested USD 225 billion throughout 2004-2017. During this period, foreign investment in the country's economy amounted to USD 107.2 billion. In order to ensure sustainable socio-economic development, the state-funded investment expenditures have grown dramatically and investment costs have a significant impact on the state budget. Foreign trade turnover in the first 11 months of 2017 amounted to 21.8 billion, while commodity exports increased by 19% and exceeded USD 14 billion. Funding of all the planned projects was ensured by investing 2 billion 690 million AZN on investment expenditures at the expense of the state budget of 2017. The country's strategic currency reserves increased by 26.2 times in 2017 to USD 42 billion in 2003. Azerbaijan occupies one of the leading places in the world by volume of foreign exchange reserves. At a meeting of the Cabinet of Ministers dedicated to the socioeconomic development of the country in 2017 and the challenges ahead, the President Ilham Aliyev stressed that USD 14.6 billion investment in the country's economy is a very good indicator. This shows that both local and foreign investors are interested in investing in our country: "This is also a manifestation of the stability I have mentioned. Because investing in foreign countries in the current financial and economic situation is not acceptable by many investors. However, investments in foreign countries and countries with good future are fixed. That's why I think about attracting about USD 15 billion a year is a great achievement."

Azerbaijan, which is a political, economic and cultural center of the region, pursues an independent, thought-proven, independent policy, today is known as the venue of political stability, peace, progress and tolerance in the international arena. Selection of 155 non-permanent members of the UN Security Council by Azerbaijan in 2011 is one of the most honored pages of our independence. Today, the tricolor flag of independent Azerbaijan, whose voice comes from the most influential tribunals in the world, is dominated by large-scale social-political and cultural events, and prestigious organizations. Our country has become a venue for international events of global importance, humanitarian forums, intercultural and inter-civilizational dialogue, as well as I European Games, Formula One races, Islamic Solidarity Games, Eurovision Song Contest. Azerbaijan's achievements have also been reflected in the reports of international organizations and financial institutions. Azerbaijan ranked 35th in the 2017-2018 Global Competitiveness Report of the World Economic Forum in terms of competitiveness among 137 countries. From 2005 to 2017, our country has risen from 69th to 34th in the Global Competitiveness Report, raising its 35th position and maintaining its leadership in the CIS since 2009. Even countries like Italy, Russia, Indonesia, India, Turkey, and the South African Republic, which is included in the G20, are also behind Azerbaijan for their economic competitiveness index. In 2018, Azerbaijan ranks third among the developing countries in the index of traditional inclusive growth of the World Economic Forum (WEF). [6] "The index of inclusive index, developed as an alternative to gross domestic product, more clearly reflects the criteria people have evaluated economic progress in their countries", AZERTAJ reports.

4. THE SCOPE OF ECONOMIC SECURITY

Economic security includes the protection of the interests of citizens, society and the state from a wide range of foreign and domestic threats, from a variety of political, economic, and informational vital interests. The vital interests are of interest to satisfy these interests in a safe way for the progressive development of the identity, society and the state. Basic security facilities include the rights and freedoms of an individual, the material and moral values of society, the constitutional order, sovereignty and territorial integrity of the state. The economic security of the country is measured by the ability to prevent threats to individual economic fields. At this point, undesirable changes in threats are possible or actual losses. The principle of maximum effective use of natural and geographical resources of the country should be reflected on the basis of the strategy of ensuring economic security. At the same time, optimization of financial and labor resources flows should be taken into account. Prior to describing the key elements of the economic security strategy, the main interests should be considered. Let's also analyze the main threats to the formation of safe areas and priorities. Concerning the interests, it is important to clearly distinguish all interested groups. Each group has interests that are expressed in actions and strategies. In this regard, the interests can be distinguished by carriers such as government, real sector companies, people and foreign ventures operating in our country. In modern Azerbaijan, the nature of the interaction of various economic interest groups has a number of features. From real-life experiences, many institutional levels are differentiated by the adaptation of interests and raising the level of financial and economic security. Thus, the interests are adapted to the state, corporate and social levels. Each carrier has its own interests that are intersect and contradictory to each other. For example, the state is interested in high tariffs in order to increase economic efficiency as a proprietor in a number of economic fields. On the other hand, large tariffs can lead to price-grade and social tension. However, social tension can be attributed to the redistribution of the revenues in favor of the poorer population groups. The problem of curiosity, problem, interest, and danger entails the competent authorities to develop a concept, strategy and program of security.

It is advisable to consider some of the key aspects of the problem, to list the hazards and to develop a security strategy on that basis. It should be noted that, in any situation, the risk may be negative or positive, depending on whether the risk will be positive or negative. Many uncertainties, conditionalities, and discrepancies emerge at the risk analysis stage. Here it is possible to conclude that in the course of development, it is necessary to consider the possibility of relapse of dangers. It should be noted that in many publications in recent years a number of approaches to the classification and evaluation of many hazards have been covered. Security, adequate economic, political, organizational, and other threats to the vital interests of the individual, society and the state. security measures are achieved through the unified state policy in the system of characteristic measures. A system of legal norms regulating relations in the field of security is being developed to create and support the necessary level of security in Azerbaijan. It also identifies the main areas of activity of the state power and governance bodies, the security agencies, the mechanism of control over the activities of these bodies, is being reorganized. State-regulated social-economic entities are empowered in accordance with law to implement the functions of ensuring the economic security of the identity, society and government in the public administration system. The state of economic security is determined by analyzing the system of indicators. These indicators allow the complex and adequate understanding of the nature of socio-economic processes by ensuring compliance with national interests and economic security requirements. All this requires a number of state-level measures: [7; p. 185]

- Establishing a permanent body that undertakes a comprehensive analysis of monitoring data, identifying potential threats and forecasting development in the economic sphere, preparing information for government officials on economic security as well as giving recommendations to management bodies. These authorities are responsible for the development and implementation of economic policies and the impact of hazardous factors on the country at that time.
- establishing a permanent analytical information base for economic security indicators;
- normative definition of the main sources of primary data on economic security, the responsibility for the preparation and implementation of the information security policy and the study of the proposed management body;
- Governing bodies take measures to eliminate factors that hinder the economic security in accordance with their competence framework and the real economic situation, as well as the determination and justification of transitional amounts of economic security indicators.

Financial security combines the complex measures, methods and means of macroeconomic protection of economic interests of the state, micro-level corporate structures, financial activity of economic entities. Financial security in macroeconomics is the ability of the state to react adequately to foreign and domestic negative financial effects in a peaceful environment and in emergencies. Financial security is the ability of the state's financial system to meet its financial needs in a timely and reliable manner to support the country's essential economic security. Financial security includes financial and budgetary-tax, monetary-credit, socio-economic, international-finance, etc. in this area, it is achieved through activities in neighboring spheres. In this regard, the concept and strategy of financial security should be reflected in the state's economic security concept, budget-tax, monetary policy, etc. In particular, there are many wealthiest countries in the world with wealth and underground resources to establish state reserve funds to provide financial and economic security. The State Oil Fund was established in 1999, taking advantage of this practice in Azerbaijan. The budget of such funds largely depends on the conjuncture factors, as a rule, on raw material prices in the world. Also, a number of countries are collecting spare funds for the period when natural resources will be exhausted.

5. CONCLUSION

The Sustainable Economic Development theory is not only the most widely studied, rapidly developing and well-known new theory of recent years, but also as a completely practical theory. Thus, most developed countries of the world consider it important to pursue sustainable economic development, as well as applying the concept of sustainable development as the base ideology of all official state and international documents in recent times. The long-term consequences of today's economic decisions are at the heart of a sustainable economic development concept. Negative economic complications and future displacements for the next generation should be minimized. Thus, the problem of economic constraints, the problem of compromise between current and future consumption should be based on the development of a socio-economic development strategy of any country in the long run. The Azerbaijani economy has entered a qualitatively new stage. New economic reform trends have been identified on the transformation of global economic challenges into the national economy. At present, the main task of the Azerbaijani state is to build and constantly develop a sustainable economy that meets global challenges. It is the main strategic line of our state. In line with this development course, the priorities of the Azerbaijani economy can be summarized as follows:

- transition to a model of innovative development;
- protection of macroeconomic stability;
- Stimulation of non-oil sector development;
- the most important thing is to direct the achievements gained to further improve the welfare of the country's citizen.

ISSUES CONCERNING IMPLEMENTATION OF THE INNOVATIVE DEVELOPMENT STRATEGY IN THE PUBLIC ADMINISTRATION SYSTEM

Naila Akhundova Fariz

*Azerbaijan State University of Economics
Abbas Sahhat 45a, Baku, Azerbaijan
naila-akhundova@hotmail.com*

ABSTRACT

Accomplishment of innovations is very crucial in purposes of increasing efficiency in productivity. The state policy on innovative development is closely related to activities accomplished by an enterprise. Management of innovative processes depends on formal market coverage of a region, scope of scientific researches, level of practical-construction works, industry production and demand for innovations. The factors hindering innovations in industrial enterprises, expenses allocated in the industry according sorts of innovations, the capacity of innovation products on novelty level and kinds of economic activities have been determined, present international practice on innovation society, the essential concepts and indicators of social innovation policy have been researched, as well as the steps carried out on the direction of innovationizing of the republic and the novelties introduced by the State Agency for Public Service and Social Innovations under the President of the Republic of Azerbaijan within the framework. The purpose of the research is to ascertain tasks on development of innovation policy and to study successful implementation of innovations in appropriate management system. The scientific novelty of the research is installation of the remedies to establish informational, spiritual and intellectual values when producing scientific-technical products, commodities, fulfilling works and rendering services, as well as appropriate development of a state strategy for innovations in this direction.

Keywords: *innovative production, innovative development, innovation strategy, scientific and technical potential, scientific innovations*

1. INTRODUCTION

All the areas connected with the people in society are eventually characterized as social spheres. But in the modern world, the power of each state is measured by the social life, the level of living and welfare of its people. Social policy is a necessary part of the domestic policy, which is closely linked to the level of economic development of each state, as a system of measures aimed at ensuring the living standards, income growth, employment, social protection, health, education and culture. In general, innovation is used in the sense of innovation. For the first time, the term “innovation” was included in the scientific circulation by C. Shumpeter’s “Theory of Economic Development”. Innovation is emerging of a unique product or service that has never been used before and a product of an independent creative work [1, pg. 26]. Innovations have been instrumental in the development of human society. Transition from one stage of development to another, at different stages, it was possible for them to rise to the level of world leaders in different countries. It is also known that historically the replacement of Eastern and Western civilizations as a place of science and innovation has been linked to the vital importance of innovations. Innovations that are of primary importance to the overall socio-economic policy of the state, as well as for achieving national goals, have major state support. In this regard, innovation projects in such areas as food processing and processing, fuel and energy complex, chemicals, new materials production, information and communication systems, transport, space exploration, biotechnology, nature use, medicine, socio-cultural development are of particular importance.

The above mentioned development trends make the development of all kinds of innovations and formation of the national innovation system a vital issue during the era of the current information and science-based society building. The social orientation of innovations, which involves the immediate majority of society, is in the forefront.

2. BASIC CONCEPTS AND DIRECTIONS OF INNOVATION POLICY

The state's innovation policy consists of a set of forms, methods, and trends that affect its production, as well as the expansion of local commodity markets, in order to release its new products and technologies. The state innovation policy is also understood as a complex of objectives and methods of influence of state structures on the economy and, in general, the effectiveness of innovation processes in society. State innovation policy should be complex and mutually relevant, and the results of sudden, isolated measures to stimulate innovation are small. In modern conditions, as innovations have a comprehensive coverage of economic life, state innovation policy becomes the main component of state regulation of socio-economic processes. Innovative policy measures of the state can be split into directives and initiators directly involved in installation of favorable environment for innovations and innovation processes. Innovation policy has time and place aspect. The time aspect determines the state's activity in the current period of time and in the long run in the field of innovation. Therefore, innovation policy is divided into current and long-term policies. Current policy consists of operative regulation of innovation activities. The long-term innovation policy is primarily focused on addressing critical issues that require greater timeframe, workforce and capital expenditure. It covers a fairly long time. The objectives and trends of the government's innovation policy are first and foremost determined by the specific features of one or another field, its production-economic potential and the competitiveness of the main product. Thus, the key element of the innovation sphere's public administration system is the financing mechanism, the organization of research and improvement of the tax policy, namely:

- allocating up to 3% of expenses part of the state budget for the financing of citizen-targeted scientific-research and experimental-construction works (SRECW), with further stabilization of the economy by increasing this share to a level which is typical for highly developed countries annually;
 - sustainable state funding of the State Academy of Sciences, science centers and organizations, state universities and other higher education institutions, scientific libraries, museums and information centers working on priority areas of science and technology;
 - ensure a large number of sources of funding for SRECW with the active support of targeted state funds;
 - establishing favorable conditions for science investment by industrial enterprises, banks, international organizations and individuals;
 - the development of competition principles for scientific programs and projects by involving control over the use of funds and the transparency of the decisions taken;
 - implementation of the contractual system into the sphere of scientific-technical and experimental-design works;
 - applying tax and customs privileges to stimulate and support scientific activity;
 - establishing facilities and providing necessary resources for scientists to participate in international projects;
 - establishing favorable conditions for the functioning of public scientific associations.
- The necessity of state regulation of innovation processes comes primarily from the increasing importance of the economy and the society as a whole. The most essential effect of innovation is the following:
1. Influence of innovations on macroeconomic indicators. Economic growth is based on the combination of extensive and intensive factors.

Extensive factors include the mass used in the production of primary resources - labor force, material composition, soil, and so on. - Explains growth; intensive factors - improving the quality of used resources and increasing the intensity of their use. In today's world, increasing capacities of the able-bodied population and increasing the product and service delivery through the involvement of new natural resources into the economic turnover are increasingly limited. Intensive factors are essential for economic dynamics. In turn, the increase in the level of professionalism and productivity of staff, material and equipment is determined by the achievements of science and technology, advanced experience and the degree of its use in the economy, i.e. the spread of innovations. The participation of the scientific-technological progress (STP) in the growth of the gross domestic product in the most developed countries is 75 to 100% according to various estimates.

2. Influence on the structure of public production. Under the influence of innovation processes, the structure of the economy varies. Due to the increased use of resources, some of them are released and distributed to other spheres of activity. Thus, the share of those employed in agriculture decreases, and the share of those involved in the sphere of services increases. Innovations lead to the establishment of a production and fields, while others gradually die and disappear.
3. Development of new, more dynamic forms of production and state regulation. Innovations change the economic organization of society. New elements (e.g., venture firms) are formed in key economic structures, transforming the content of the interaction between them. Management technology develops - vertical effects are improved and replaced by horizontal relationships.
4. Changing the Consumption Structure. Innovative processes affect not only production, but also practically all aspects of social life. Consumption structure of both material and non-material benefits is improved.
5. Influence of innovations on social stability. Innovation processes are increasingly social. Not to mention that the innovation generated economic growth promotes the improvement of the living standards of the population, while innovations also help to solve the problem of employment with the opening of new high-paid jobs. This, in turn, contributes to the improvement of education and health.
6. Improving the ecological situation in the country. The intensity of innovation processes in the modern world greatly exacerbates the ecological problems. Scientific and technical achievements allow the use of irreplaceable resources and harmful waste by improving innovation, production and consumption structures. These problems are especially relevant when adopting the concept of sustainable development in the 21st century, which calls for stable ecological balance.
7. Development of international scientific, technical and economic cooperation. The cooperation of various countries in the innovation sphere is observed in different ways – the creation of global scientific and innovative infrastructure in the internationalization of resources, both in materialized and non-materialized form of technology, in order to obtain new scientific and technical results, and spreading of global characteristic of its essence. In a modern world of STP, a country, even the developed country, can't overcome such innovation projects. [2, pg. 167] Full integration of the world's innovation processes is not possible without adequate scientific and technological base of the country, as well as mechanisms for the adoption of innovations. The level and effectiveness of the country's access to the international division of labor is characterized by its position in the global market of goods and services, as well as the availability of qualified specialists. This position is gradually increasingly determined by the advantages inherent in nature reserves or with other advantages of extensive nature, with innovations that ensure product competitiveness.

8. Influence of innovation policy on national security. At present, innovation is one of the essential components of state security. This situation has both external and internal aspects. As for the first, the conversation is about scientific-technological security, i.e. the existence of a strong enough scientific-innovation potential that allows the country to resist any dictatorship in terms of limiting the use of cutting-edge technologies, the breakdown of basic technological chains. The development of scientific and innovation potential is particularly important for the country's defense capacity building. The internal aspect of the issue is related to the spread of innovations that can prevent accidents, natural disasters, terrorist acts and other illegal acts, and minimize their negative outcomes.

3. SOCIAL INNOVATIONS

Undoubtedly, social innovation also serves to ensure national security. Social innovation is closely linked to the formation of electronic state and information society during the globalization period. In the current period, almost every country in the world is preparing and implementing international and national programs for the transition to information society, as well as to the e-government. The social innovation policy is a multifaceted activity, which is implemented by the state, reflecting new strategies, concepts, ideas and organizations that are aimed at raising the living standards of the population, meeting the various social needs. Social innovation policy is based on the unity of social state-building and social protection and social justice ideas. In this process, the complete rebuilding of the social infrastructure takes place at the following stages:

1. social environment analysis;
2. development of software and strategy for innovations;
3. their implementation;
4. evaluation of results.

Social innovations can be complicated and have both internal and external sources of development, clear and hidden, internal and external development mechanisms. For this reason, their purposeful, purposeful, and spontaneous (non-arbitrary) forms are distinguished. Members of society can be both active participants in innovation processes, and can be influenced by innovations that can't be positively or inescapably appreciated [8]. Social innovations have different goals, which are reviewed in the next two subdivisions.

3.1. E-government

Realization of innovations in modern state administration is closely linked with the building of e-government. The term "e-government" is a product of recent times and does not have a single definition of the unit. Sometimes this term is mixed with the term "electronic government" and these two terms are used interchangeably. It should be noted that the governance is a broader conception and also involves the decision-making process, the relationship between government officials and the public. The use of ICT by the government, civil society, and political institutions to promote citizen participation in electronic governance. Electronic government can be considered as an integral part of the e-governance system. E-government is an essential mean of ensuring national innovation systems and efficient management. In recent years, most governments seek to increase transparency and transparency in their activities. As one of the main obstacles to economic development, one of the most effective tools for preventing corruption is building e-government. The idea of e-government emerged in the twentieth century is a means of ensuring transparency as it is a means of institutional reform.

3.2. State Agency for Citizens Service and Social Innovations under the President of the Republic of Azerbaijan

Decree of the President of the Republic of Azerbaijan of December 29, 2012 "On Approval of the Development Concept" Azerbaijan 2020: Looking to the Future "was emphasized as one of the main goals of the innovative society building. Social innovation is one of the key components of the organization and management of the National Innovation System in Azerbaijan, one of the key components of the innovation infrastructure. Establishment of the State Agency for Citizens Service and Social Innovations under the President of the Republic of Azerbaijan on July 13, 2012 is one of the important measures for modernization of public administration, enhancing transparency and forming a new style of governance. "The agency is based on the need to increase transparency in public bodies, to provide citizens with better quality, comfortable, new style and application of modern innovations, compliance with ethical rules for citizens and ensuring citizen satisfaction. Establishment of the agency is of great importance for the development of the relations between "civil servant" and the formation of new thinking styles and methods of action for officials" [9]. The number of services provided at ASAN service centers has been increased and the number of functional support services has been increased and more than 130 types of services have been provided to citizens, by the Decree of the President of the Republic of Azerbaijan dated February 11, 2014.

4. STATE INNOVATION POLICY

One of the important issues of innovation policy of the state was the coordination of the work of the executive authorities, the authorities of the Azerbaijan Republic and the municipalities in order to develop a comprehensive approach to innovation development, efficient functioning of the innovation system and implementation of state innovation policy. In this regard, the mechanism for implementing the state's strategic and innovative function is followed. [3, pg. 142]

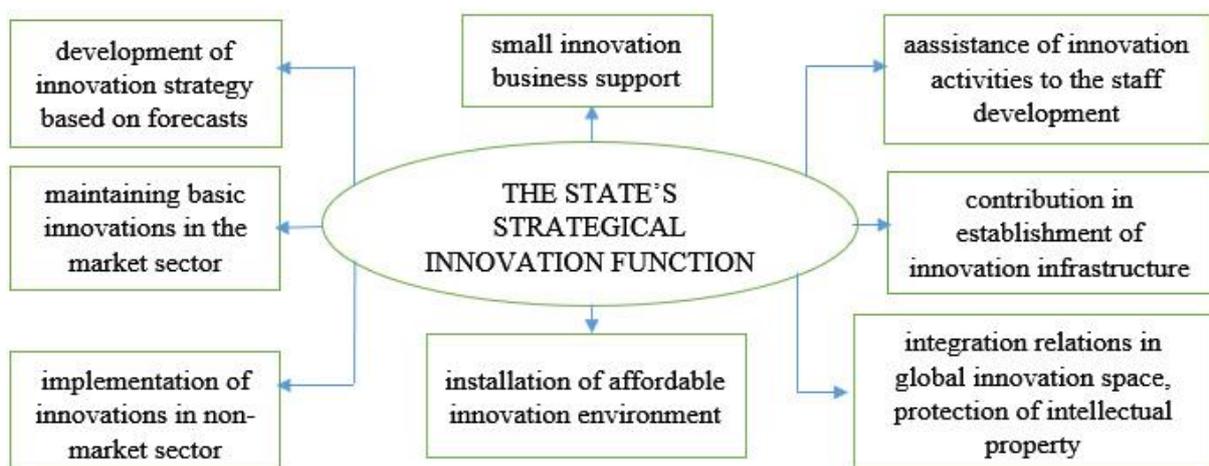

Figure 1: Realization of the strategic and innovative function of the state

According to the picture (1) it is possible to define the main tasks of the state's innovation policy: [4, pg. 72]

- selecting regional strategies and priorities for the development of innovation when critical technology and innovation projects are implemented in industry, affecting productivity and product competitiveness;
- development of a comprehensive approach to the solution of innovative development issues;

- maintenance and development of scientific and technical and production-technological potential;
- maintaining and developing the training system of scientific and pedagogical workers and specialists;
- ensuring access to higher technologies;
- establishing favorable economic and financial conditions for a wide range of innovation activities, eliminating legitimate entrepreneurship and unfair competition;
- organizing specialist training and re-training system in the field of innovation entrepreneurship;
- implementation of world standards on product quality and environmental protection.

According to some analysts, in the case of a general crisis, innovation in the regions can only be activated on the basis of an effective regional innovation policy. Both regional and central authorities should be directly involved in its implementation. Regional innovation programs should include the following sections:

1. Analysis of the state of scientific and innovation sphere in the region.

It should reflect in the section: the level and extent of use of innovation potential; perspectives and directions of innovation activity, its scale and influence on competitiveness of regional products; structural and institutional changes; conditions for innovation activation.

2. Goals and development priorities of the scientific-innovation activity in the region

It is proposed that the system and structure of the objectives be based on the following principles:

- regional goals should come from the concept of general scientific and technical and innovation development of the country and should not be contrary to strategic goals;
- regional objectives should be expressed in consideration of regional characteristics and needs;
- The objectives of the regional program should not be based on the availability of resources and capacities; on the contrary, the reserve program should be formulated for specified purposes;
- The goals setting and overall goals program should be developed at the level of modern methods with extensive use of independent experts and expert evaluating systems.

In this project, the most realistic approach to choosing the development priorities of the innovation sphere is the proposed approach to the global criteria of scientific and technical progress and the development of high technologies. It is proposed to consider achieving the goals of its socio-economic development as the second generalizing medium in the selection of science-innovation development priorities. In this case, the main task of regional governance bodies is to establish favorable economic environment and conditions for innovation activity in the scientific and innovation sphere.

3. The means and remedies to achieve goals

It should reflect the structural and institutional changes in the scientific sphere, the development of regional innovation infrastructure (innovation funds and banks, venture firms, scientific and technological parks and business incubators).

4. Types of provision of regional scientific and innovation policy

It should reflect in the section: Types of provision of innovation policy as organizational, information, legal, human and social-psychological (as well as justified). In the Innovation Development Program of the Republic of Azerbaijan, the key role in the development of innovation activity in the field should be allocated to the territorial government, as the state should focus on the implementation of innovation policy in the central regions.

The real support of innovation processes in the regions is one of the key factors that contribute to the formation of innovation climate and the production of competitive products. In order to activate innovation activities in the regions, within the competence of territorial authorities, it is necessary to install institutional and economic conditions for the development of innovation activities and innovation infrastructure, and to establish responsible structural divisions for the development and implementation of regional innovation programs. Regional innovation programs should be based on the economic and social development programs of the regions and should identify the key development priorities of innovation infrastructure and innovation potential, including staff training, stimulation of specialized subjects of innovation activities and methods.

The functions of these structures are particularly consist of: [5, pg. 356]

- control over the development, approval and implementation of regional innovation programs;
- formation of innovation infrastructure (technoparks, business incubators, regional innovation funds, centers, etc.) in the regions;
- creation and regular replenishment of regional data bank of scientific works of the country in the field of technology, management, new goods and services;
- establishment of regional centers for professional training and coordination of innovation activities for the innovation sphere;
- attraction of investments for the organization and development of science-intensive production, the introduction of resource saving and ecologically clean technologies, modernization and reconstruction of existing industrial enterprises in the region (including the financing of innovation projects from the field budget, public and private innovation funds);
- allocation of land, equipment and grants to innovation subjects;
- development of proposals for support of innovative activity subjects at the regional level;
- installation of a technology transfer network (including propagation of innovation activities and promoting innovation by attracting industry-chamber chambers outside of the region).

Only such a complex approach will enable innovation in the regions of the republic. In addition to the above, it is necessary to pay attention to the factors that prevent the development of innovation in Table 1.

Table 1: Factors hindering innovation in industrial enterprises in 2008-2018 in Azerbaijan

Economic factors	Production factors	Other reasons
shortage of own funds	low venture innovation capacity of enterprises	absence of demand in new production as a consequence of earlier innovations
insufficient funding from the state	lack of skilled workers	absence of legislative and normative-legal documents regulating and motivating innovation activities
low effective demand for new products	shortage of information pertaining new innovations	undetermined deadline of the innovation process
high value o innovations	non-admission of innovations by enterprises	underdevelopment of innovation infrastructure (mediation, information, law, banking and etc.)
high economic risk	lack of information about sales markets	technology market underdevelopment
prolonged reimbursement periods of the new products	shortage of cooperation with other enterprises and other scientific organizations	

4.1. State support for the development of innovation activities

Basic principles of state support for innovation activities. The experience of economically developed countries shows that sustainable economic development in the context of global economic competition is driven by the high level of application of new technologies and products in production. According to various estimates, today 70 to 100% of production growth in these countries is due to the use of innovations.

The state stimulates the development of innovation activity in our country by providing the necessary economic, financial, organizational and normative-legal conditions.

Economic conditions include: [5, pg. 356]

- a) carrying out tax policy and pricing policy that promotes growth in the innovation market;
- b) providing efficient employment in the innovation sphere;
- c) rendering various kinds of financial support to the enterprises of the country adopting and disseminating innovations, making tax and customs privileges;
- d) assisting modernization of the technique;
- e) development of productive leasing;
- f) animation of entrepreneurship;
- g) prevention of unhealthy competition;
- h) development of foreign economic relations in the sphere of innovation;
- i) foreign economic support, including customs incentives for innovation projects included in government innovation programs.

Financial circumstances include:

- implementation of the budgetary policy ensuring the financing of innovation activities;
 - allocation of direct public investment for the implementation of innovation programs and projects that are of utmost importance to the state, which are uninteresting for individual investors;
 - establishing a favorable investment climate in the innovation sphere;
- granting subsidies, preferential loans, guarantees to domestic and foreign investors involved in innovation activities.

Organizational conditions are following:

- formation and implementation of state, regional and regional innovation programs;
- innovation infrastructure development;
- assisting in the preparation, re-training and professional development of innovation personnel;
- information support for innovation activities (information about state innovation policy priorities, materials provided and completed, and free use of innovative projects and programs may be the basis for innovation activities);
- assistance to integration processes, expansion of interaction of regions in the sphere of innovation, development of international cooperation in this field;
- promotion of local innovation products to world markets;
- protection of interests of subjects of innovation activity in international organizations.

Regulatory and legal conditions include: [6, pg. 28]

- determination of legal basis of mutual relations of innovation subjects;
- ensuring the protection of the rights and interests of subjects of innovation activity, including intellectual property rights.

In order to regulate innovation processes, the state supports both direct and indirect innovation activities. The direct state support for innovation activities are accomplished based on the selection of priority areas of science and technology and the definition of a list of “crisis technologies”, targeted financing of projects from the state budget and joint financing of projects and programs implemented by non-governmental structures, the formation of innovation activity infrastructure and so on. Indirect incentive measures on innovation activities include the use of fiscal methods (preferential taxation, rapid depreciation, separate markets, regulation of the fields) the regulatory framework for the creation, transfer and protection of intellectual property, as well as the formation of favorable conditions for the activities of the structures involved in the commercialization of scientific knowledge.

5. TASKS TO BE IMPLEMENTED IN AZERBAIJAN FOR INNOVATION-DRIVEN DEVELOPMENT

For the decade ahead, the following directions have been identified for innovation-oriented development and modernization of the Azerbaijani industry:

1. The Azerbaijani industry should be developed innovatively. For this purpose, it is necessary to adopt modern technologies in Azerbaijan’s entrepreneurship, big companies, increase the competitiveness, quality of products and increase the production of export-oriented products. This policy has been stratified since 2007. In 2010, more than 5 times more products were produced than modern technology in 2007.
2. Ensuring dynamic, sustainable development of the Azerbaijani industry. For this purpose, it is necessary to further develop, strengthen and enhance competitiveness of foreign and national entrepreneurship. For this aim, attention should also be paid to the fact that entrepreneurs invest in the Azerbaijani industry outside the country, foreign entrepreneurs. This policy has also been an essential component of economic policy in Azerbaijan. But at the same time it was important to build entrepreneurship and to gain experience in modern times, to increase the competitiveness of entrepreneurs and strengthen their positions on the world markets, the acquisition of new markets for industrial products.
3. Providing comprehensive, comprehensive development of Azerbaijan’s economy, especially the leading industry. The heavily-specialized industry, which has a considerable place in the Azerbaijani industry, should be integrated and competitively interconnected with the knowledge economy.
4. Modernizing the industry’s staffing. To do this, the development of human capital as a whole and the transition to a new quality, ensuring the growth of the proportion of highly educated, secondary special education among the population, raising the creative thinking skills for the industry, “adapting their level of preparedness to the requirements of the creative economy”. To this end, the work on revitalization of the education system in the republic should be accelerated, integration of higher education, science and economy should be strengthened, technical vocational education should be expanded and this educational level should be adjusted to the requirements of innovative economy.
5. Adding new sources of growth to the traditional economy of the republic and traditional GDP growth sources. For that aim, It’s necessary to continue the work on establishment of new sources of economic growth commenced in recent 5-6 years in the republic. Reconstruction and development of the Baku-Tbilisi-Kars railway, International Maritime Trade Port in Alyat, TANAP Pipeline, East-West, North-South transport corridors, will play an essential role. New sources of economic growth may include technoparks, companies that develop and implement high technologies, industrial campsites, shipbuilding plants and other similar businesses.
6. Improvement of the normative-legal base of innovation development, modernization. Continuing the work done in this direction should contribute to the efficient, innovation-

oriented development of the economy as a whole, by installing favorable conditions for innovation, the modernization organizations and other subjects.

6. CONCLUSION

Generalizing the aforementioned issues and challenges, we can conclude them in the following form:

- There is a problem of determining the state's priorities in this area because of the limited resources that society and state can invest in science, technology and innovations. Depending on the size, the state will have global (global), international and national priorities in the field of innovations.
- Selection of priorities and the support of research and development on their basis and the selection of separate scientific organizations associated with them are a key element of state scientific and technical policy.
- When choosing state priorities in the field of scientific and innovation development, it is impossible to exclude subjectivism completely. Therefore, the issue is to ensure independent expertise of innovation projects before the government. It would be convenient, if the expertise procedures involved all interested parties - developers, educators, government agencies, scientific community, public organizations, and so on. representatives to participate. [7, pg. 154]
- The process of choosing the priorities should be based on the interconnection between the directions, as well as the new areas that have high innovation potential, but which do not have the financial resources and organizational structures necessary for lobbying. In this regard, researches based on studying flow streams, bibliographic references, patent and other information media are of great importance.

ABSTRACT

This paper provides an assessment of the priorities that have recently ensured the development of the agricultural sector of the Republic of Azerbaijan, as well as clarifies the role of infrastructure development for the country's economy. The development of infrastructure in rural areas contributes to the alleviation of unemployment, the formation of a highly skilled, intellectual, cultural stratum of workers.

Keywords: *region, innovation, production, economics, modern condition, country, products*

1. INTRODUCTION

Today the world is characterized by the transformation of the world economy into a globalizing economic system and by the intensification of intergovernmental economic and trade relations. In each country, there are efforts being made to produce high-quality and more competitive agricultural products for the purpose of satisfying domestic needs and ensuring efficient commodity exchange in the world economic system. Holding a dominant position in the field of raw material, material and services is based on a number of natural, economic, technical, professional as well as comparative and other advantages of countries. In order to organize innovative production, countries can both meet their needs and access to effective commodity exchange in the world market, by promoting the areas with comparative advantages. Azerbaijan has sustainable production resources, effective cultivation and cattle-breeding, developing processing industry based on innovation technologies, qualified personnel working in the national agrarian sphere, and modern infrastructure. Given these opportunities, the organization of innovative production is of great necessity in the regions of our country.

2. THE IMPORTANCE OF INNOVATION TECHNOLOGIES IN REGIONS

Favourable climatic conditions in Azerbaijan paved the way for the development of agriculture in this area. Yet, Azerbaijan has historically been a land of cultivation, cattle-breeding, and silkworm breeding, fruit-growing, livestock etc. Today our country has diversified and even more developed agriculture. Thus, in recent decades, Azerbaijan has gone through substantial growth in the fields of output of various plant products (grain, cotton, tobacco, grape, fruits and vegetables, etc.), (cattle-breeding, sheep-breeding, poultry, sericulture, apiculture etc.). With regard to the development and implementation of appropriate complex measures, the important tasks have been set before farmers, including scientific and pedagogical staff of scientific-research institutes and higher schools, according to the Decree of the President of the Republic of Azerbaijan "On measures to accelerate the Socio-Economic Development in the Republic of Azerbaijan" on November, 24, 2003, accelerating the socio-economic development of the regions. In this regard, one of the main tools for carrying out the country's strategic development plan is the development and realization of regional development programs, which proves itself in international practice. These programs involve the issues of organizing and improving the infrastructure [1, p. 1].

The State Programs on Socio-Economic Development of the regions of the country (2004-2008, 2009-2013 and 2014-2018) create great opportunities for the development of the infrastructure. Thus, based on achievements of a conference dedicated to results of the implementation of the State Program on Social and Economic Development of the regions of Azerbaijan, the President of the Republic of Azerbaijan, Ilham Aliyev once again showed that there is a possibility for the agrarian sector to raise the quality of product and to enter the foreign markets. At the same time, there is also some advanced processing industry in the country, which traditionally functions on the basis of local agricultural raw materials. Thus, the manufacture of canned fruits and vegetables and juice, including tomato, vegetable oil, beer, wine products, tea, meat and dairy products, cereals (flour-milling, semolina and mixed feed, bakery goods and paste), and the production of cotton, wool, cocoon and leather raw materials, and fermented tobacco is rapidly developing in the agricultural processing industry of Azerbaijan. In addition, it should be noted that there is a possibility to significantly increase the production and manufacture of a number of valuable essential oil, food, perfumery and natural colouring products (rose, olive, pumpkin seed, saffron) and floriculture. The agrarian production sphere of the country's economy has been formed on the basis of the former Soviet Union interests, and the application and introduction of innovative technologies to the country have not been possible. Therefore, in order to effectively integrate our country as an independent subject into the global economic system, the competitive advantages we have in the world markets are appreciated first. In accordance with the presidential instruction, the development of agriculture and processing industry is based on the latest innovation technologies so that specific weight of quality goods, which is the main advantage of manufactured products, increases annually and takes an opportunity to get access to the foreign markets. On the basis of existing theoretical approaches and defined methodology, competitiveness of all sectors of cultivation and cattle breeding on the country's agricultural sector, and the factors affecting it were assessed in a comprehensive manner. At present, we witness once again the successful implementation of the "the State Program on Socio-Economic Development of the regions of the Republic of Azerbaijan in 2014-2018" under condition which innovative production forms and develops in the regions [2]. Thus, the work on expanding artificial insemination measures among animals continues to improve the gender composition of livestock. Artificial insemination specialists who have completed the course are provided with artificial insemination equipment, towing motorcycle, liquid nitrogen and animal seeds at the expense of the state budget. The establishment of milk reception centres in the regions is underway to provide the processing stations with qualified and uninterrupted transportation of milk being produced in the republic. The works in the field of building the large dairy and meat farms proceed. The tender was held in August and September of the current year and it is planned to bring 7100 heads of highly productive Holstein-Friesian and Simmental breeding cattle to our country. The animals brought by leasing will be placed in large farms and farmers will be given advice on storing, feeding, breeding and reproducing these animals.

3. THE NECESSITY OF FORMING INNOVATION IN MODERN CONDITION

The transformation of material values and economic potential into human capital development gives impetus to the development of innovation in the country's infrastructure. The fields covering this section are quite extensive. Scientific-research works based on new technology, and science, education, protection of intellectual property, health care, health facilities, sports tourism complex, culture, preservation of historical monuments serve human factor and require sufficient financial means. Australian scientist I. Schumpeter argues that there are five signals in the innovation process: the usage of new techniques, the provision of a new technological process or production with a new market; the use of new-featured product and new raw material; changes in the organization of production and logistics; the emergence of a new sales

market [3, p.215]. K.V.Pivovarov from the Russian Academy of Economics named after G.V.Plekhanov clarifies the innovation terms and explains in detail that innovation should be based upon something new; it should meet market's needs; it should bring profit to the manufacturer [4, p.125]. The United States and Japan defined the path of innovation 30-40 years earlier than European countries. European countries first attached importance to innovation problems at the state level in 1980s and 1990s. The state has changed an innovation into a priority of economic development by means of direct and indirect encouragement of the protection of intellectual property, new technology-based scientific-research works and innovation-based production areas. At first, due to the lack of adequate staff, emigrants who could meet these requirements were provided with high-paying jobs and housing. Science, education, and vocational training are based on the requirements of innovative areas. At that time, innovation turned into a business area, and small, medium-sized firms, rich businessmen ("business angels") invested in this area. The investment in human capital also proved to be productive. Leading countries give preference to trade in goods, material, machine, bench, equipment and ready-made modules. The leading western and European states, specializing in innovation, draw the attention of states and businessmen, by organizing trade fairs dedicated to trade in technology, scientific and technical knowledge, and engineering services in the territories of interested states [5, 6, 7]. The company not only undertakes the construction of a new technology-based plant, its next service, and training of local specialists, but also provides its employees with high-paying jobs on a contractual basis. In world practice, companies apply and test scientific and technical innovations, including new technology in their own countries, and finally sell licenses (patents). Innovation-oriented intellectual technology works in the form of new partnership in the global economic system, exporting to foreign countries by seeking more efficient production conditions [8, 9]. Innovation technology is based on the need to work effectively in the international arena, cheap domestic raw material, cheap material, cheap workforce, and sufficient infrastructure and state support. The new technology, operating on the territory of several countries, leads to the creation of international economic system. Thus, investment of one country creates the second economy in another country. The US occupies the first place among the world countries for the size of economy. In the agrarian policy of our country, which has gained its independence, the establishment of AIC (Azerbaijan Industrial Complex) is based on innovation economics. For this purpose, the material-technical base of schools in the regions is strengthened and provided with intellectual staff. Institutions move to a flexible personnel training system, and a mobile scientific production complex is created. The state-controlled innovation and financial sector of the infrastructure are strongly developed on the basis of a balanced and complex socio-economic development program being implemented in Azerbaijan. Investment in the development of human factor serves to reduce poverty, unemployment, and to increase an income of the population, to improve health, and to regulate demographic situation and to boost economy of the country.

4. ADVANTAGES AND EFFICIENCY OF APPLYING INNOVATION TO PRODUCTION IN THE REGIONS

It is no coincidence that the quality factor transforms into innovative infrastructure facility in modern globalizing economic relations. First of all, innovation leads to new techniques, technology and new top-quality products. The production, consumption and position of new goods expand in the sales infrastructure such as domestic and foreign markets. The quality of food products is directly connected with human health so that it is under state control and is state's object which regulates consumption. Finally, the quality of foods determines the level of development in the economy, dominates the market, conquers the world markets, and stands in an objective position to determine the value of goods and material. Quality is the object of state security in the strategic plan.

Despite the fact that foreign goods are sold in and satisfied with the country's domestic market infrastructure, there is state control over the safety of importing products in Republic of Azerbaijan as in all other countries. Foods differ from each another by their physical, chemical properties and other compositions. The various substances in each of them determine nutritional value, importance of digestion, taste, colour, smell, shelf life, transportation conditions, structure and above all, quality of foods. Such foul-smelling chemicals as ammonia, sulphur dioxide, indole, skatole, mercaptan, volatile acids etc. come from the dissolution of organic substances when foodstuffs are kept or transported in unfavourable condition. Such food products are not edible. In recent years, aromatic compounds have been bought to artificially develop different tastes and smells in food products. The nutritional value of foodstuffs depends mostly on the chemical composition, biological and physical features. Food products are to be harmless, energetic and easy of digestion etc. Limited land and production resources, inflation and constant rise in price of mainstream and working assets encourage peasant households to take high positions in the market by producing high-quality goods and to increase the production efficiency. This innovation-oriented development based on state support is primarily related to the introduction, regionalization and seed-growing of more productive grain, potato and other plant seeds in our country. According to the concept of agricultural development, highly productive pedigree livestock are transported to our country and sold to farms at a 50% discount in order to increase demand for innovation technologies. In recent years, pedigree cows from the Netherlands have been settled in Zagatala, Sheki, Lankaran and other regions. Practically, these cows are quickly adapted to local conditions and milk 8 to 10 times more than local cows. Such innovation technologies are widely used in milk processing, production of fruit juice, vegetable oil, sugar, fruits and vegetables, and long shelf life of foods. Exporting to our country from abroad "Sandora" brandy juice is mainly made of orange, pineapple, mandarin, banana puree, canned lemon juice that are transported from African countries. Juice product rich in vitamin are sold in the markets of Russia, Central Asia and the Caucasus. As it is known from the scientific information that practically in all countries top-quality agricultural products are chosen to manufacture the natural foods for children, preferably in different attractive assortments, forms and colourful containers. The quality of food products plays a decisive role in the health and intellectual development of people, especially the young generation. Healthy and optimistic life in society and family constitute the material basis of quality food products. Despite the fact that freeze-dried breakfast foods are made and sold in different names and assortments in the large cities of Azerbaijan, assortment of freeze-dried foodstuffs imported from abroad to our country, including cake, biscuit are sold with offered prices of manufacturers. There are some people who doubt that several types of freeze-dried foods and drinks replacing fruit juice are fully made of natural agricultural products. These doubts are related to the lack of natural fruit required for the production of large quantities of goods in these countries. If these products are manufactured on the basis of natural milk, sour cream, sugar, olive oil and soybean being produced in our country, they will be able to compete with foreign products in the domestic market. It is known that the composition of milk and dairy products, olive oil, soybean is rich in soluble proteins, oil, minerals, biologically active microelements, vitamins and is essential for a healthy lifestyle. At present, tourism infrastructure in the country's economy is developing rapidly. In line with the requirements of this new area of the economy, there is a need in the country to produce high-quality national agrarian food products, which satisfies agritourism, namely the contingent of tourists. Foreign technology is being exploited and applied to manufacture top-quality goods. In terms of innovation technologies, the production of protein, oil, easy-to-use mineral substances, assortment of food products rich in selected vitamins, which can revolutionize in the region, turns into a daily work of genetic engineers, biotechnologists. Genetically modified agricultural crops are resistant to pests and diseases, and have high productivity and long shelf life.

More than 50 agricultural plants have been modernized, tested and put into production in the world countries. They are apple, tomato, pumpkin, cucumber, salad vegetables, soybean, wheat, rice, sunflower, tobacco, cotton, etc. The productivity and nutritional quality of genetically modified plants is far above their predecessors. At present over 100 plants are being processed and foods are produced from genetically modified goods in 130 countries and are put on sale. In comparison with such fields as industry, construction and others, the main reason for lag in the development of infrastructure facilities and agricultural products on the basis of innovation technologies of manufacturing and processing industry is the poor development of agribusiness in the agrarian sector, and the low level of profitability of this real sector of the economy owing to the formation of sale prices of agricultural products outside manufacturing. Agribusiness entrepreneurship is rapidly developing in our country. The professional training and intellectual level of farmers have been shaped on the basis of Soviet-era technologies. In order to overcome this gap, it is preferable to teach innovative production-oriented specialties in all higher and secondary vocational education institutions of the Republic. At present, more than 700 students study at foreign universities every year. Enlightenment system and information about scientific-technical innovations, finance, production links and other innovations can be enhanced. For example, farmers of the European Union countries can easily get information from the innovation technology website. Finally, planning of agricultural production and financial infrastructure of the economy for the first time over the past 70 years and centralized supply of these with material and technical resources have been carved in people's memories. It is a fact and we will still enjoy its results for several years. So, as it is evident from the world's developed countries and our own experience that the state cares about the application of innovation technologies.

5. CONCLUSION

In accordance with the State Program on Social and Economic Development of regions in 2014-2018, a great deal of work has been done on the basis of innovation technologies, the processing industry based on foreign techniques and technologies has been modernized with the state support, new products are put on sale in the domestic and foreign markets, unlike previous years, agrarian farms attach importance mainly to the production of top-quality products in the food processing industry, and to sorting, packaging and storing of the product. The state provides the following favourable conditions for implementing an innovative agricultural production policy in the regions of our country:

- Establishing free competitive environment derives from monopoly under the abundance of the same product.
- Providing quality of the offering products with state control.
- Increasing investment for the sound environmental condition of production.
- Increasing mineral and energy resources based on innovative technologies.

ABSTRACT

Entrepreneurial University, being one of the elements of the new innovation model of development - the "Triple Helix" model, appears as a new balance between science, education and power. In such situations, the role of the process approach in the management of business processes in universities is growing. The number of methods to determine priorities for managing business processes is limited. In the article, based on the application of multi-criteria methods of decision-making, including the method of analyzing hierarchies, are determined by the priorities in the management of business processes in higher education institutions. The research carried out to a certain degree made it possible to refine the methodological toolkit to substantiate priorities in the management of business processes in higher education institutions. Based on the description of the advantages of the hierarchy analysis method. The conclusion is made that it is necessary to provide favorable conditions for the formation of an innovator who has a set of skills and skills necessary for the modern economy

Keywords: *business process, business function, business operation, entrepreneurial university, criteria, priority*

1. INTRODUCTION

Over the past decade, Azerbaijan has undergone dramatic changes in higher education systems, targeting universities to operate in a market environment with a high degree of uncertainty. Modern global changes in the world show that the sphere of higher education is assessed as a means of maintaining competitiveness and leading position in world markets, as one of the guarantors of national security. Zilwa D. [Zilwa, 2010] distinguished the following trends observed in education in the world.

- globalization of education;
- reduction of state financing and growth of transaction costs associated with market orientation;
- development of information technologies in education;
- mass education;
- increase in accountability to stakeholders.

Among the factors that determine these trends and influence them, we can distinguish: the acceleration of scientific and technological progress, the growth of life expectancy, global problems in the field of ecology and energy. In these conditions, institutions of higher education

require participation in the processes of generation and transfer of new knowledge to a wider population with the use of modern means of communication and information technology [Silakova L.V. 2017.p.362]. There is a transformation of the implementation of business processes within their core business. Due to the specific approaches to managing changes in this area, the methods used deserve careful attention and analysis. The future state and development of civilization depends on what kind of knowledge, qualities and abilities a person who is educated today will possess. High rates of social and economic development are impossible without a high level of management effectiveness in higher education. In this context, the issues of implementation of the process approach in higher education institutions, which includes not only the description of the university activity as a network of interrelated business processes, but also their constant control, management and improvement become topical. The purpose of the study is to assess the priorities of business processes in the Azerbaijan universities based on the hierarchy analysis method.

2. LITERATURE SUMMARY

Since the end of XX century. humanity discusses the next model of the university's evolution of the entrepreneurial model. The global economy of the 21st century stands on 3 whales: 1) knowledge; 2) technology; 3) entrepreneurial initiative. Accordingly, in the post-industrial society, the goal of education changes: if in the classical higher education this is a transfer of past experience; then in innovative higher education, the shaping of the image of future creative activity. The leitmotif of innovative education is as follows: "Do not overtake the past, but create a future". The main principle of organizing an entrepreneurial university is the harmonious unification of three basic types of activity: 1) scientific research (obtaining knowledge); 2) education, including education (transfer of knowledge and skills, 3) innovation (application of knowledge). The modern complex and dynamic institutional environment requires the transformation of the university into an innovative, competitive university, into a new type of business model with high adaptive capabilities. To do this, it is necessary to improve the management systems of universities. In the literature, there are a small number of approaches for determining priorities in managing business processes. approach Hammer and Champi [1997], Robson and Ullah [1997]; an approach developed within the PROSCI project, Crowe T.J., Rathi K. and Rolfes J.D. [2005]; Mazur's approach, etc. [2000]. Hammer and Champi [1997] suggest first of all to find the shortcomings of the essential processes that contribute to the emergence of the problems of the enterprise. Robson and Ullach [1997] suggest a method for ranking processes. They use a five-point scale for evaluating the processes according to the following criteria: strategic importance, vitality, customer expectations and the ability to achieve desired results. The authors of the approach developed in the framework of PROSCI [2005] suggest using taxonomy (classification) of the BP to identify opportunities for reengineering. Mazur and others. [2000]. suggest a methodology for selecting processes for detailed analysis. Separate aspects of the basic principles and methods for implementing the process approach were studied in the scientific works of Davenport T. [1993], Repin V.V [2004], Karaulov N.N. [2009], Remenik S.Y. [2009], Shelmin E.V. [2007] and others. Creation of entrepreneurial universities and organizational directions of transformation ClarkB.P [2011]. According to the author of the idea of the "Triple Helix" Henry Etskowitz [1998], in the close connection "state business university" the role of universities is prevalent, how can only universities create an innovative development model in which the university itself will perform a "quasi-governmental role as a regional or local innovation organization ". Studies of the processes of transformation of the education system and the influence of universities on this process were carried out by the authors Galazhinsky E.V. [2014], Gauss O. [2016], Grudzinsky A.O. [2012], Zaitsev A.V. [2012], Shattok M. [2006], Sheremetev E.N. [2015] and others.

The generalization of these studies allows us to draw three main conclusions:

- the list of criteria used is limited;
- the majority of criteria (significance, impact on the client and on business) is of an abstract nature, that is, the authors do not show how the criteria are related to specific indicators characterizing the processes or situation;
- the used selection rules are reduced to two: a weighted sum that is applied only to quantitative indicators and positioning in two-dimensional space (in the form of a graph or matrix), which limits the number of criteria used (no more two).

Therefore, when developing an approach to determining priorities in managing business processes, two main aspects need to be considered: first, the evaluation of business processes can be carried out according to many criteria and, secondly, it is required to choose the appropriate multi-criteria method of decision-making.

3. PROCESS APPROACH TO MANAGEMENT

In any university, a large number of business processes simultaneously operate, differing both in their purpose and in their basic characteristics. The process approach to management ignores the organizational structure of the organization's management, with its inherent assignment of functions to individual units. In the process approach, the organization is perceived by managers and employees as an activity consisting of business processes aimed at obtaining the final result. The organization is perceived as a network of business processes, which is a set of interrelated and interacting business processes, including all functions performed in the organizational units. Process-oriented management allows qualitatively to change the activity of the organization at the operational, interfunctional and interorganizational levels. The definition of business processes as an economic category [Harrington D. and Esseling K.S. 2003], [Andersen B. 2003], [Zinder E.Z. 1996]. [Davenport T. and J. Short. 1990]. "... the desired result is achieved more effectively when the activity and the relevant resources are managed as a process" Sheremet A.D [2009, p. 173]. "Business processes are a collection of different activities within which one or more types of resources are used at the entrance, and as a result of this activity, a product is created at the output that is of value to the consumer." Hammer and Champi [1997]. In the standard "ISO 9000 Quality Management" [2007 process is defined as "a set of interrelated or interacting activities that convert inputs to outputs". A business process in a university is understood to mean a specifically ordered set of business functions in time and space, aimed at creating the desired result and achieving the main goal of the university by converting inputs into outputs that have value for the consumer. We define the business process as a system of consistent, targeted and regulated activities in which, through the management impact and through resources, the inputs of the process are transformed into outputs-process results that are valuable to consumers. Some authors [Svitkin, M.Z.2000], not disclosing management processes and servicing, to the main processes include educational activities, research and consulting activities, development and production of educational materials (for external use), educational activities. Bedenko N.N. [2011] carrying out the classification of business processes of the university, refers to the main processes - educational, educational, scientific processes and the process of additional education; to managerial processes - marketing, planning, management of resources, quality management; to auxiliary processes - financial, personnel, information, material and technical, methodical, economic processes and the process of legal provision. The main business processes should be attributed educational and scientific-research activities [Glushchenko AV, Egorov EM. 2011]. They directly add value (cost) of services to the consumer. In essence, these are the processes leading to the provision of educational or research services, starting with the

analysis of existing requirements of stakeholders, or stakeholders, which include: consumers and end users (students, parents, employers); employees of the university; investors; founders; suppliers and partners; society as various associations and state structures, etc.), and ending with the provision of services, in other words, producing the main "outputs" for the university.

4. METHODOLOGY

In the hierarchy of the process approach, nesting of various levels of processes in the management scheme is observed: business processes → business functions → business operations. The business process is described not by a single goal achievement index, but by a group within the relevant business functions of the business process. To calculate the index of the degree of achievement of the goal, the integrated assessment method was used. The essence of the method consists in the aggregation (convolution) of the indexes of the achievement of each business function in a single assessment that visually characterizes the work of the business process [Kolos, E.A 2011]. The integral index of the aggregate of various indices takes into account the degree of influence of individual indices of business functions on the final evaluation of the effectiveness of the business process. As a tool for prioritizing the weighting coefficient of each integral index of the business function (w), the hierarchical analysis method developed by Saati T. and Kerns K [1989] in the 1970s was chosen for the purposes of the study. The method of analysis of hierarchies is a method in the theory of decision making which is quite effective for solving multicriteria problems with hierarchical structures. The method consists in decomposition of the problem into increasingly simpler components and further sequence of judgments of the person who makes the decision on pair comparisons. These judgments are then expressed by the method of matrix algebra and expert evaluation of finite estimates (Silkin G.Y. 2012). The hierarchy analysis method includes procedures for synthesizing multiple judgments, obtaining priority criteria and finding alternative solutions. Solving the problem using the hierarchy analysis method is a process of step-by-step prioritization. It includes the following components:

1. Identification and identification of the problem;
2. Decomposition of the problem into a hierarchy of tasks;
3. Construction of matrices of paired criteria comparisons;
4. Calculation of priorities;
5. Synthesis of priorities [Saati T., 1993].

The implementation of these stages within the framework of the hierarchy analysis method allows obtaining objective quantitative estimates of the weight of all elements in the structure of the hierarchy associated with the problem posed.

5. RESULTS OF THE ANALYSIS

Based on a set of criteria for evaluating alternatives, we developed a hierarchical model, depicted in the form of a diagram in Fig.1, which clearly reflects the hierarchy of the system of criteria that characterize the importance of the business functions of the educational business process. With its help, it is possible to comprehensively assess the extent to which the business functions fulfill the tasks facing the structures providing the educational service.

Figure following on the next page

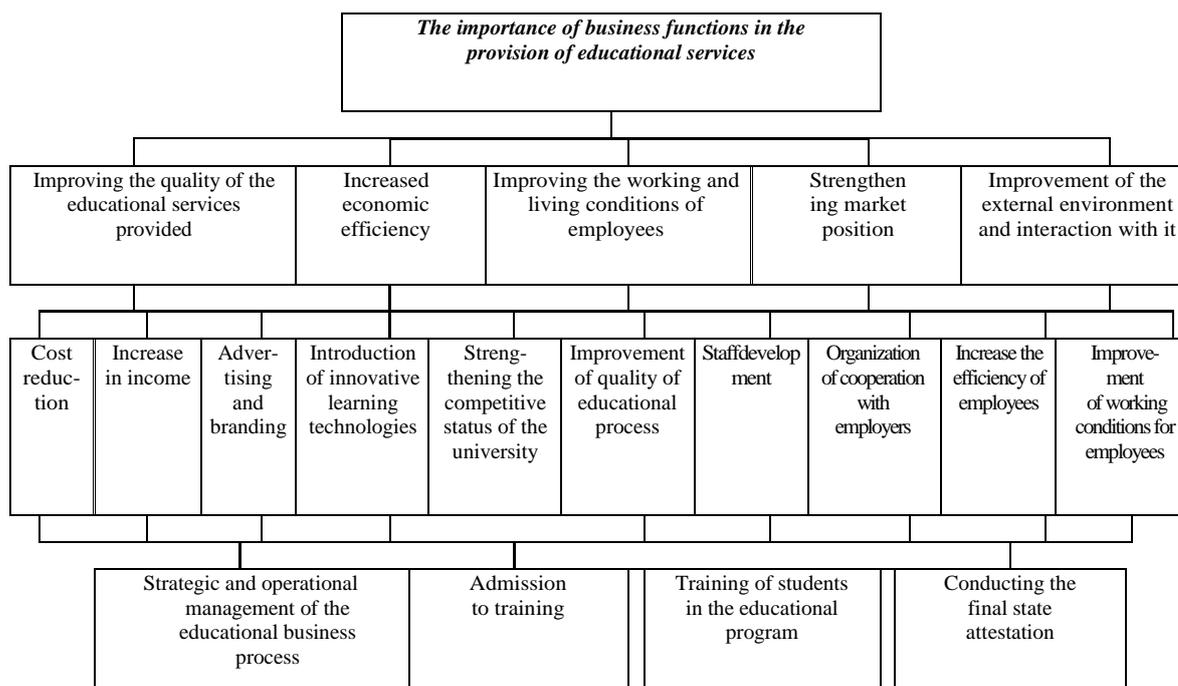

Figure 1: Scheme of the hierarchical model of the importance of the business functions of the educational business process

In this model, two hierarchical levels of the importance of the criteria in relation to the global criterion are singled out and the links between them are indicated: the links of the alternatives with the second-level criteria, the links of the second-level criteria to the first-level criteria. The latter are locked into a global criterion. As alternatives, the business functions of the educational business process identified in Fig. 2, which will be evaluated expertly by the degree of influence on these factors: strategic and operational management of the educational business process; admission to training; training of students in the educational program; conducting final state attestation. At the same time, business functions that exert the greatest influence on the over-listed criteria are, in our opinion, the most important for ensuring the effectiveness of the educational business process of the university. According to existing recommendations, the group of experts should not exceed 20 people [Evlanov L.G.1978]. In the expert survey, four doctors of science, four candidates of sciences and two specialists with a great experience of work took part. The selection of experts was carried out on the basis of: competence, lack of personal interest due to expertise, creativity (breadth of knowledge), conformism (absence of subordination to concrete influence). After selecting experts, they were asked to fill out a questionnaire that contained a text part explaining the examination rules, square matrices of pairwise comparisons in accordance with the presented hierarchical model of the importance of the business functions of the educational business process. To process the expert data, the method of averaging the values of expert estimates for each of the pairs of compared criteria was used, that is, there was a geometric mean for a set of peer evaluations referring to the same pair of criteria. The results of the expert data on the criteria for the matrix of pairwise comparisons of the first level criteria with respect to the global criterion are presented in Table 1 and Table 2.

Table following on the next page

Table 1: Determination of the most important task in the delivery of educational services

Factors	Improvement of the quality of the educational services provided and scientific research activities	Increased economic efficiency	Improvement of working conditions for employees' lives	Strengthening market position	Improvement of the external environment and interaction with it	Normalized estimates of the priority vector	Rank
Improvement of the quality of the educational services provided and scientific research activities	1	8	7	5	6	0,598	1
Increased economic efficiency	1/8	1	1/2	1/3	1/2	0,054	5
Improvement of working conditions for employees' lives	1/7	2	1	1/2	1	0,092	4
Strengthening market position	1/5	3	2	1	2	0,161	2
Improvement of the external environment and interaction with it	1/6	2	1	0,5	1	0,095	3
Total	1,634	16,000	11,500	7,333	10,500	-	-

$$\lambda_{max} = 5,079$$

Consistency ratio: CR = 0,0175

Consistency index:

$$CI = 0,0196$$

Table 2: Importance of the business functions of the educational business process

Business function	Assessing the importance of a business function	Rank
Strategic and operational management of the educational business process	0,295	1
Admission to training	0,230	3
Training of students in the educational program	0,287	2
Conducting the final state attestation	0,188	4

6. DISCUSSION AND CONCLUSION

Based on the results of the calculation of the final priority vector, it can be concluded that the most important from the point of view of the criteria considered are the business functions of strategic and operational management of the educational business process (29.5%) and training of students in educational program (28.7%). Proceeding from this, one can conclude: first of all, it is necessary to optimize such business functions that can significantly affect the effectiveness of the educational business process. The method of analyzing hierarchies is a sufficiently qualitative procedure for finding the weight coefficients of business processes that are used to calculate the integral measure of the effectiveness of the management system. Ranking of business processes in this way allows you to get the most objective and reliable value of the integral indicator of the effectiveness of the management system, which contributes to the adoption of rational management

decisions. The application of the apparatus of the method of analyzing hierarchies allows you to take into account all possible internal and external factors, to determine the directions of innovative policy and to present the process of structuring in the form of an integral hierarchy. At the same time, process management provides an opportunity to purposefully improve individual business processes, business functions, business operations on the basis of coordinated efforts of all participants in the management cycle. Based on the research, we came to the conclusion that the management of changes in universities should be sustainable and extend to all departments, involving them in the decision-making and accountability processes. At the modern university in Azerbaijan, several areas for improving the process of change management can be identified:

- formation of the non-linear (matrix) management system of the university;
- involvement of employees in decision-making processes and their immersion in the strategic goals of the university through continuous updating of knowledge and advanced training;
- the motivation of units that are willing to change, and the promotion of risk and entrepreneurship;
- the formation of appropriate values and entrepreneurial culture in the units.

Thus, the conducted research will allow to take a fresh look at the activities of the university in the modern reality, and the systematization of the observed changes in the business processes of universities and identification of areas requiring the development of measures to create conditions for activation of activities will allow developing a set of interrelated measures for transforming the university into an entrepreneurial type.

ABSTRACT

The aim of article is estimation of innovation activity by considering the role of innovations in the regional economic development. The author took 10 economical regions as an investigation object that classified for the economical features of Azerbaijan. In the article conducted a research on the topic of international practice, taking into account regional features of the estimation of innovation activity. On the basis of regional understanding criteria and European Commission Regional Innovation List indicators, and indicators that differentiate innovation leaders were compiled, according to the Economic Cooperation and Development Organization methodology the innovation territory patterns on the European countries and efficiency indicators on the patterns, the fields that belong innovation policy were investigated. In the article factors that relevant to Azerbaijan were chosen as the result of investigation factors of innovation activity. Regional innovation activity was estimated by considering international criteria on the estimation innovation index. The results can be used for the estimation of Azerbaijan Republic innovation index and for the basis of innovation criteria of regional economic development.

Keywords: *innovation activity, region, Oslo government, scientific area*

1. INTRODUCTION

Azerbaijan Republic economy innovation transition - competition ability, economical increase, increasing living standards, providing to implement other national superiorities is the efficient use of the results main conditional scientific-research and procedures. In this condition, potential development innovations are more important to applying the efficient innovations to economic and social fields and the sum of technical, manufacturer, organizational, marketing, financial operations.

1.1. The Main Understandings

Regional innovation activity is the result of the region's innovation action. Innovation activity includes:

- To implementing long-lasting scientific-technical programs;
- To finance fundamental researches for quality changes in the productive forces with the aim of to develop economic structure;
- To applying, spreading, releasing principally new techniques and technology and preparing economical types.

The innovation activity is the sum of all scientific, technological, organizational, financial and commercial steps that lead to realization of innovations. The regional innovation system defines the criterions of region understanding as follows:

- Region must not be a determined area.
- It is general in the special criterions conditions.
- It may differentiate from external areas with the special type of related union characteristics;
- It has some types of internal unions;

These regions are used with the industry clusters conception from economic point of view. Clusters are characterized with the tight network of the economic subjects. These include processing facilities, financial institutions, research institutions and technology transfer agencies, economy unions and unions, regional governments and even information unions as producer and marketing companies. Nowadays innovations surround all activities of the technological changing process in contrast to the former approaches. Regional innovation and cluster making policy was realized for developing competition ability of the country. At this moment, it is important to make regional innovation environment. Regional innovation environment formed in the basis of *actives, networks and cultural environment*. Making of regional innovation environment concludes with the Innovation-Productivity-Prosperity chain. As actives, the human, intellectual, finance, physical and institutional capital in the region is being considered:

- Human capital
Talented people manage the innovations with the generalizing new ideas. The talented labor marketing is one of the main issues there, while many companies are settling in the region. Innovative companies tend to the specialized labor in their industrial field. Regional perspective must be estimate with the ratio factors of the possible work force, specialization and educational institution activity in the point of human capital.
- R&D institutions
These institutions are addition to the knowledge base and important in the economic development with the long-term. Either universities or firms and investments by governments increase the amount of innovational product and services.
- Financial capital
The realization of innovative ideas requires a considerable quantity of financial resources. In many cases, institutions which getting successful results easily financed with the venture capital.
- Industry base
Regional industry base is important. If there is no industrial base, making new industry areas will be difficult and usually it is excel to expand area.
- Physical infrastructure
Here includes transport and telecommunication infrastructure.
- The law and regulatory environment
Especially, here are important taxes and other regulatory methods.
- Life Quality
It is subjective measurement. It measures with the life costs, communication term and crime ratio in the standardized size.

With the aim of supporting regional innovation, actives are being associated. The most effective network is making contact among the business, education and non-state subjects. At the same time, city sport competitions or university students associations and other non-formal contacts like this performed in the region as the information networks have important mediation functions in the knowledge transfer.

Culture is considered as the business culture of the region. The important thing in the business culture is the wiliness of sharing business leaders' cooperation, information and views.

2. INTERNATIONAL EXPERIENCE

According to the European Union Statistical institution Eurostat's regional innovation indicators the complete factors that determine economic development of the region consist from the regional population as potential work force, regional infrastructure as provided aggregate material, city agglomeration tendencies in the region as the geographical reflection of the economic activities concentrations, economical structure of the region and the possibility of the regional "gamers". The main involved indicators in the regional innovation process are the innovation general costs and output indicators significantly developed in the region over the years or they are new product of the sale proportions. Regional innovation activity characterized by two groups in the point of simplicity and agility of the indicators collection. The activity indicators that getting easily called first indicators. The indicators that have no initial priorities, indicators on the R&D centers, indicators on the mutual regional influence, bibliometric indicators, and infrastructural indicators. Development of innovation requires to making necessary base and preparing innovation strategy in the country. Appropriate innovation fields' policy generalized as follows (OECD methodology):

1. Making knowledge consist of current and future sources firms and state actives for the long-lasting development. Scientifically based capital and its related employment, scientific abilities and education are indicators that make innovation knowledge to investigation in the center of attention.
2. Join to Knowledge helps to inform political discussions with the organizing measures on the nature and variety of mechanisms for the exchanging knowledge. The effect of the scientific-cooperation (based on patent references) and scientific-industry association (patent documents to the non-patent documents) are in the submitted indicators. New indicator added in 2013 was investigator's mobility that at this time the carrier of the scientists who have publications in academic magazines and innovation process is followed.
3. Targeting new development areas analyze technologies on the country's comparative advantage and the direction of the country's scientific tries. On this factor R&D and innovation indicators, ecology, information and communication technologies are submitted on the biotechnology and nanotechnology and expanses are examined in the smart ICT infrastructure.
4. Free innovation concerned with the business sections dynamism. The main methods are considered as the new indicator that offered on the intellectual property package in the protecting innovations connected with inventions of firms in the analyzing of the factor, firm's patents, commodity niches and industry patterns use.
5. Competition factor in the economic knowledge mainly gives attention to the wide scale of use of developed indicators that possible for use, and how countries can increase their competition force.
6. Participating in global economy attracts impacts of structural indication to the countries that participate in the global value chain. The indicators are associations between firm size, life cycle and development as well as employment patterns that accompanied in the industry related abroad, treatment and services.

Estimating the regional innovation indicators over the European countries based on countries general estimation and countries were compared considering the most common indicators. However, mainly indicators system is applied for the estimation of innovation index, while interior innovation activity is being estimated.

3. COMPARATIVE ANALYZING SCIENTIFIC - TECHNOLOGICAL DEVELOPMENT OF ECONOMICAL TERRITORIES

European experiment approve one more time that, the investigations must be adjusted to the international standards and requires. Exactly, the statistics of the investigations and operations must be as indicators system that showed in the Oslo and Fraskat government. However, in these governments, indicators system that considered activities of the scientific organizations and estimation methods do not let CIS member countries comparative analyzing. Standards accepted in CIS member countries are not in power. Works must be done to accelerate activities in the appropriate field as follows:

- Making of legal base must be strengthened
- Using with international estimation tools monitoring must be held
- Definite targets must put for attract scientific-research organizations to the innovation processes
- Innovation activities stimulation tools must be improved
- Event program must be compiled to accelerate innovation activities
- National centers must be made on the preaching, applying and commercialization researches.

CIS Economic Council prepared documents and programs relating CIS countries' integration to the innovation processes happened in the world and realize them. We show these for example: "The regulation about operator of the interstate purposeful program on the CIS member countries cooperation in the innovation field until 2020", "Establishing CIS patent and innovations bank conception", "Resolution about progress of the CIS member countries' program and projects scientific-information assurance conception in the innovation field" etc. The Azerbaijan is not participating in this program. However, our Republic realizes free events and programs to integrate innovative processes happened in the world. The agreements signed with Belarusian, Ukrainian, Hungarian state innovation, transfer agency and centers at the state level. Processes of the innovation activity field, happened in the world kept in the spotlight, in many cases, the participation is realized in the processes appropriate to state policy. The research is done on the applying comparative methodology of the innovation development implemented at the national level in the Azerbaijan, European Union countries. The support organizations are much more between CIS countries. Researches and international activities of Scientific-Production Enterprise prove that innovation infrastructure is much more in the Russian and Belorussia. Byelorussians widely use from Russian experience in this field. The innovation activity is paid very big attention in Russia. This attention is shown especially in the level of economic zone: implementing innovation development programs in the regions, organizing cooperation between different economic zones in the researches and operations filed and implementing innovations projects, investigating in the basis of European Union innovation benchmarking methodology field etc. For example to such works: Russian Technology Transfer network (RSTTS, www.brin_net.ru), national information-analytic center on the Scientific-technological activity innovation infrastructure and regional innovation systems monitoring (www.miiis.ru), "Education and Innovations in Russian regions" information-analytic portal (www.regions.extech.ru), "Innovation and Entrepreneurship" (www.innovbusiness.ru); economic zones' innovation index, potential innovation and formation innovation development indicator system fields. Usually, adopted potential innovation estimation methodology based on the legislation of that country. Therefore, unexplained significant differences establish when the standard estimation methodology applied in the European Union countries. While the international standards are being prepared, it is impossible to consider all countries' specific features, generalized indicators system is accepted in the international approach, the countries' political aims are not considered.

Recent days, requests have increased to the scientific policy and strategy-technology planning. This concludes with the improving of decision-making process information provision in the level of national and economic zone. As we noted that, governments and indicators system is not reflect various states' national innovation systems features that made by UNESCO Statistic Institution located in Montreal. Reports prepared in the Electron Information System borders on the Norway are examples for this. Accepted indicator system and innovation policy analysis methods must not be applied to the country[10]. Therefore, in every country investigations are done on the making of innovation development indicators system relevant to it. Information provision possibilities on the gathering and processing of the information in the making of indicators system, directing to the solution of issues on the country development considered as main criterion. In this field, investigations do not give range in Azerbaijan. Taking into consideration that, socio-economic condition of Azerbaijan's economic areas is different, every economic region has its own specific features and sharing of potential innovation is non-proportional. Innovation oriented development of Azerbaijan economy reflected about 30 high legislation documents accepted by government. Various scientists on the estimation of some ingredients did investigations. For example: [5; 3; 4; 6] works of Z.M Najafov, F.A Gasimov, T.M Aliyev, S.Abbasova, A.Muradov etc. However, these scientists approached to this issue individually and they did not research complex indicators system and its information provision. Investigations of Russian Sciences Development Issues' Academy of Sciences, Science Investigation and Statistic Center, Belorussian Scientific-Technological Field System Investigation and Information Provision Institution (Belize), Kazakhstan Scientific-Technology Information Center considered basic. Considering the Russian experiment in this field, in the estimation and investigation of scientific-technological field in Azerbaijan "Russian regional scientific-technology complexes: the estimation of investigation scheme and methodology considered as a key in the estimation of indicators and comparative investigation methods" [Error! Reference source not found.]. Azerbaijani national and specific features, statistic indicators in this field, collected and processed information, considering potential innovation of economic regions and areas it clarified, indicator system changed and estimated for Azerbaijan. Based on the methodology applied, the overall structure of indicators for evaluation and comparative analysis of the changed scientific and technological and innovation activities in Azerbaijan is given[Error! Reference source not found.]. All the data required for the calculation of the index of innovation have not yet been reflected in the statistical indicators of Azerbaijan. Since the data from different sources were not used to calculate the index of innovation, the data from the Azerbaijan Statistical Committee's book were selected and the calculations were made based on them.

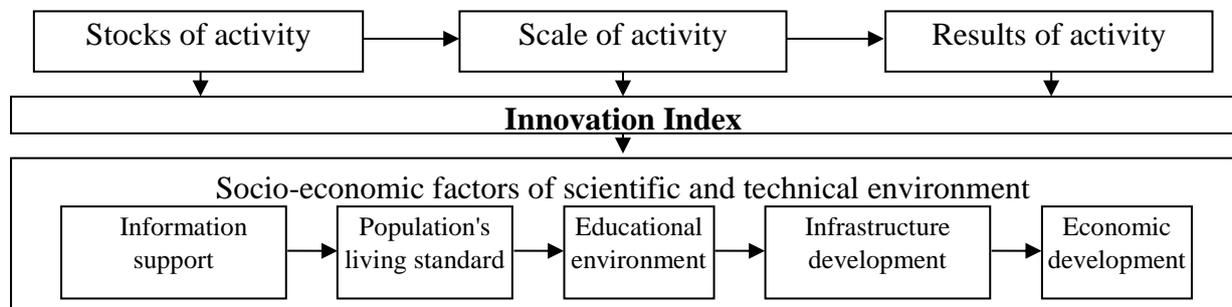

Figure 1: Innovative performance indicator system

The innovation index is calculated based on the indicators characterizing the organization's innovation activity. Indicators of socio-economic environment are considered as external factors. External factors have a direct impact on the formation of the index of innovation.

4. EVALUATION OF THE ECONOMIC ZONE OF THE INNOVATION INDEX

Creating a database that is consistent with the structure of the selected indicators. As an experimental base, we take eight zones from the ten economic zones of Azerbaijan (Figure 2). Because there are no scientific potential in the two zones (Upper Karabakh and Kalbajar-Lachin zones are under occupation).

Figure 2: Economic zones of Azerbaijan

The list of economic zones is based on the list of Azerbaijan State Statistical Committee. Based on the methodology, additional 6 initial data were used to calculate the specific indicators of innovation development and the overall index. The calculations were carried out using the SPSS 17.0 package. As we have shown, some of the indicators characterizing the activity of the economic zone are not placed in the official statistical data of the Azerbaijan State Statistical Committee (not elaborated). Therefore, we have to reduce the indicator system slightly. The normalization of the indicators is done by linear scaling method. After completing the methodology, we get Table 1. As a result, economic zones are ranked according to innovation development. As we carry out calculations on economic zones, their number is limited and there is no need to divide them into clusters.

Table 1: Innovation index according to economic zones for innovation development

Indicators	I1	I2	I
Sheki-Zagatala	0,037363	0,145204	0,091283
Guba-Khachmaz	0,087007	0,17371	0,130358
Ganja-Gazakh	0,109372	0,225259	0,167315
Absheron	0,117459	0,234816	0,176137
Aran	0,120869	0,104973	0,112921
Lankaran	0,143004	0,129577	0,13629
Nakhchivan	0,248108	0,228631	0,23837
Upper-Karabakh	0,312987	0,048597	0,180792
Baku	0,355347	0,40469	0,380019

Calculations made to normal data allow for the initial sharing of economic zones on the selected indicators system. As can be seen from Figure 3, the Baku city differs sharply from the content of the index of innovation, then it is possible to separate the Nakhchivan, Guba, Absheron, Ganja-Gazakh, Nagorno-Shirvan, Aran economic zones, Kelbajar-Lachin, Lankaran and Upper-Karabakh economic zones. Upper-Karabakh and Kalbajar-Lachin are under occupation today and can't be analyzed. Thus, the economic zones are divided into three groups.

Figure following on the next page

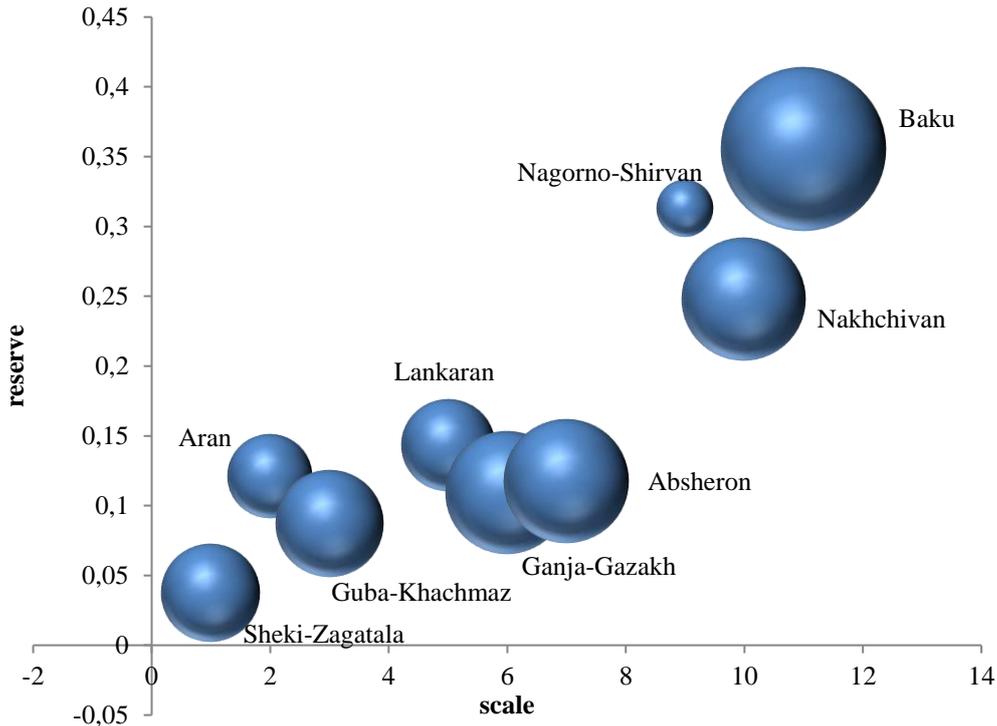

Figure 3: Distribution of economic zones by integral part of innovation index

The cluster analysis of SPSS-17 once again reaffirmed what we have said above. Let's look at the ranking of economic zones according to the division.

Table 2: Grouping of economic zones according to innovation development level

Economic Zone	Special indexes					Innovation index
	Reserves			Scale		
	Cadre	Material-technical base	Special index	Science	Special index	
Cluster 1						
Baku city	0,475369	0,235326	0,355347	0,809379	0,809379	0,582363
Cluster 2						
<i>Nakhchivan</i>	0,26705	0,229167	0,248108	0,457262	0,457262	0,352685
<i>Absheron</i>	0,105454	0,129464	0,117459	0,469632	0,469632	0,293545
<i>Ganja-Gazakh</i>	0,187493	0,03125	0,109372	0,450519	0,450519	0,279945
<i>Guba-Khachmaz</i>	0,06464	0,109375	0,087007	0,347419	0,347419	0,217213
<i>Average price</i>	0,156159	0,124814	0,140487	0,431208	0,431208	0,285847
Cluster 3						
<i>Nagorno Shirvan</i>	0,125974	0,5	0,312987	0,097194	0,097194	0,205091
<i>Lankaran</i>	0,254758	0,03125	0,143004	0,259154	0,259154	0,201079
<i>Aran</i>	0,210488	0,03125	0,120869	0,209946	0,209946	0,165408
<i>Sheki-Zagatala</i>	0,043475	0,03125	0,037363	0,290408	0,290408	0,163885
<i>Average price</i>	0,158674	0,148438	0,153556	0,214176	0,214176	0,183866

In the table economic zones are the index and index of innovation indexed for groups and subgroups on clusters, average values for each cluster are given. As you can see, Baku is ahead, because the main scientific potential is accumulated in this city.

The importance of economic zones in the cluster occupies a special place in Azerbaijan. In addition to scientific potential in these zones, techno parks and free economic zones are created in Absheron, and special attention is paid to innovation development in every field and management in the Nakhchivan Autonomous Republic. The other two zones: Ganja-Gazakh and Guba-Khachmaz, as well as economic zones in the cluster 3, have the inverse proportion on the prices of special indicators. In other words, the material technical base of the zones with high staffing value is low. The added external factors allow the analysis of the innovation development level of the economic zones. Let's analyze the impact of the socio-economic environment on innovation development.

5. ANALYSIS OF THE IMPACT OF THE SOCIO-ECONOMIC ENVIRONMENT ON THE SCIENTIFIC-TECHNICAL COMPLEX OF ECONOMIC ZONES

At this step the selection of the indicators goes through two stages. In the first stage, the statistics are excluded from the initial data, and then on the basis of the correlation matrix, indicators are discarded does not meet the economic content of the relationship interchangeable dependency ratio. Other non-select indicators are then used to calculate the relevant indexes for the groups of factors. The prices of all calculated indicators are given in Table 3. Here, the economic zones have risen in the increasing order.

Table 3: Factor Index

№	Economic Zone	Index			
		<i>Innovation</i>	<i>Education</i>	<i>Level of life</i>	<i>Infrastructure</i>
9	<i>Guba-Khachmaz</i>	0,1353314	0,01552	0,150648	0,23982595
8	<i>Sheki-Zagatala</i>	0,1552562	0,032513	0,165321	0,26793471
7	<i>Lankaran</i>	0,1619498	0,04267	0,176193	0,26698667
6	<i>Nagorno Şirvan</i>	0,1659169	0,030055	0,134221	0,33347475
5	<i>Aran</i>	0,1839129	0,025665	0,166893	0,35918047
4	<i>Ganja-Gazakh</i>	0,2595628	0,191951	0,253392	0,33334487
3	<i>Nakhchivan</i>	0,2817092	0,237058	0,198661	0,40940835
2	<i>Absheron</i>	0,4974446	0,283127	0,209206	1
1	<i>Baku city</i>	0,9176619	1	1	0,7529858

The average value of Baku's factor index is sharply different from the other zones. The remaining clusters also differ from each other by factor values. At the next stage, regression models, which show dependence on the indicators included in the various factor groups of innovation activity, are established. As a result, the equation was established on all blocks. As you know, regression analysis determines dependence between dependent and non-dependent variables. SPSS software has been used to set regression equations. Here, the result variable is given by the factor change. At the exit:

1. Correlation matrix;
2. Regression equality ratios;
3. R quadratic equality ratios;
4. Prices that determine the importance of the model.

The received regression equations and statistics are given in Table 4.

Table 4: Linear regression equations for the group of factors

<i>Group of factors</i>	<i>Linear regression equation</i>	<i>Determination coefficient</i>	<i>Darbin-Watson coefficient</i>
<i>Education level</i>	$\dot{I}=0,15+0,80I_{edu}$	$R^2=0,93$	1,575
<i>Population's well-being</i>	$\dot{I}=0,11+0,82I_{well-being}$	$R^2=0,76$	0,831
<i>Infrastructure development level</i>	$\dot{I}=0,03+0,60I_{inf}$	$R^2=0,56$	1,530

It should be noted that, the determinant coefficient depends entirely on the index of the index of innovation, and the Darbin-Watson ratio is smaller than 2, which means that autocorrelation for equity indicators are adequate. The determinability ratios of the innovation coefficient education level, the level of well-being of the population, and the level of infrastructure development depend on the indicators included in the innovation index model: the highest levels of education (93%), at least the level of development of the infrastructure (56%).

6. RESULT

Territorial distribution of scientific and technological potential in the formation of the MIS in the country and management of innovation development are important issues. The formation of the MIS in Azerbaijan envisages the establishment and development of the regional modules of the system. Regions play a decisive role in the formation of innovation infrastructure, the formation of knowledge and the establishment of a system of interaction with enterprises, and the utilization of scientific and technical achievements. MIS content consists of subsystems. We can divide these subsystems into 2 parts: manager and managed. Scientific-technological complex managed subsystem, scientific and technological policy is the subsystem that manages. These subsystems have a complex structure. Regional scientific and technological policy - the ruling subsystem - is under the influence of three equal forces: regional policy, scientific and innovation policy, regional socio-economic policy. The combination of these three elements leads to the establishment of a regional scientific and technological complex. This, from the other side, ensures economic growth in the region and, another side, the country's innovation development. Science-technology area should be improved in Azerbaijan today. The development of scientific and technical potential and innovation in the economic zones during the development of the national innovation system in the country is one of the main issues. Formation of the national innovation system requires the development of economic zones. As a result of the research, two methods were adapted and calculations to Azerbaijan: evaluating the development of scientific-technical complex and methods of analysis of the development of scientific and technological complex. Both methods are based on the system of indicators characterizing the internal and external environments and factors of the scientific-technological complex. The proposed methodologies are widely used in the international arena. The author has studied the work carried out on the basis of inter-country and interregional comparison in the international arena, based on those models; the system of characteristic indicators for Azerbaijan was selected and calculated. The innovation index has been formulated based on the internationally accepted principles for the evaluation of scientific and technological development. A comparative assessment of the scientific and technological potential of Azerbaijan has been found in the index of innovation for each economic zone, which has been classified and clustered for zoning. The selected indicator system allows evaluating the level of innovation development of different areas and analyzing the factors affecting the innovation index in the economic zones. We divided the economic zones into clusters and analyzed the

factors. Method of measuring innovation potential was prepared with the method of fuzzy clusters based on factors.

Innovative activity of economic zones was measured on the basis of the selected indicators system allowing the country to share the scientific and technological potential of the country and to analyze the cluster.

ABSTRACT

Georgia's strategic partner is very important for Georgia to continue close cooperation with the Republic of Azerbaijan in politics, both export and import economics, energy, transportation and cultural spheres. The main trading trends between Georgia and Azerbaijanis revealed in the article. The methods of statistical observation, grouping and analysis were used in the research process. According to both export and import, ten countries are included. It is noteworthy that the commodity structure of export and import has not changed in dynamics. According to the data of 2017, Georgia is in the second place by Azerbaijan, followed by Russian Federation and its index is 9,9%, which is 4,6 percent behind Russia; The volume of export to Azerbaijan in 2007-2013 increased by 13% compared to the previous year and by 417% in 2007; Export goods are very profitable. Among them: alcoholic drinks, potatoes, non-alcoholic beverages, exports of non-alcoholic drinks, curry fruits, cigarettes, ferro alloysetc. As for Azerbaijan, it is in the fourth place according to import countries. It should be noted that export goods are very profitable. Among them: electricity, oil and oil products , oil gases, ores and concentrates , vegetable oiletc.The article has a great practical significance, since the tendencies of trading economic cooperation expressed here can be used to estimate correct aspects of trade relations between Georgia and Azerbaijan.

Keywords: *export, import,trade, transportation, relation, oil products,economic cooperation*

1. INTRODUCTION

Today, the globalization has become a crucial issue in the everyday political, economic, social and cultural life. From the strategic point of view, it is very important for Georgia to enhance the world trade - economic, financial and other kinds of relations, especially when it is in the foreign interests of the country to share the advanced European values and experiences and join the European Union. In order to form the right economic policy of the country, it is necessary to conduct a theoretical and practical research of integration of Georgia with the world economy, to study the foreign economic contacts quantitatively, to reveal the major developmental trends, to calculate their predictive indices, to estimate the results correctly and to develop appropriate political-economic proposals and preventive measures (N. Abesadze,2016,pp.11). Within the background of the globalization processes taking place in the world economy, one of the principal preconditions for the development of Georgian

economy is the availability of highquality statistical data depicting the integration processes. This, surely, means the perfection of the activity of the National Statistics Office and its maximum harmonization to the international standards. In-depth changes and rapid development of the socio-economic life have made it necessary to see the theoretical issues of statistics in a new light and develop scientifically proven methodological principles compatible with practice (Abesadze, 2015, p 333). Active involvement of the Georgian economy in the process of integration, leads the country to the economic system in order to harmonize national standards with international standards. Globalization is the object of everyday political, economic and social life. The situation was different in the past. Georgia has been actively engaged in trade-economic relations with different countries in different historical periods. After the collapse of the Soviet Empire it inherited a violated economic system with full experience of market relations and similar legislative basis that caused a lot of problems for the country. Provision of sustainable economic development of Georgia is impossible without improving foreign trade balance. To achieve this, it is important to increase the export potential of the country, depending on the supportive measures of export, local staging, the policy pursued by the country etc. Foreign trade will be reflected positively on economic growth when export turns to imports or we have a positive trade balance. Statistics creates a general picture of the position of development of national economy and covering the economic and socio-political processes in the regions, using different statistical methods. Georgia's strategic partner is very important for Georgia to continue close cooperation with the Republic of Azerbaijan in politics, trade, economics, energy, transportation and cultural spheres. Consider the statistical characteristics of trade relations with Azerbaijan. Purpose: The main goal of the work is to reveal the main trading trends between Georgia and Azerbaijan. Research methodology: qualitative and quantitative methods of data analysis applied in the article are widely accepted in economic science (Gelashvili, S., Abesadze, N., Abesadze O., 2015): the methods of statistical observation, grouping and analysis were used in the research process. The graphical expression method is widely used. In addition, the methods of induction, deduction, analysis and synthesis, selective observation were used in the research process. Comparative indicators of the structure, dynamics and comparison were calculated. Accordingly, the aim of our research is to distinguish the major problems of the integration of Georgia into the world economic sphere, to reveal the tendencies characterizing to foreign trade, to calculate the prognosis of the main indices of the foreign trade turnover of Georgia with the purpose of working out the further conclusions and recommendations. (N. Abesadze, 2014, pp. 167)

2. FINDINGS

It should be noted that according to the data of 2017, Georgia is in the second place by Azerbaijan, followed by Russia and its index is 9,9%, which is 4,6 percent behind Russia. Turkey occupies third place with 7,9%. The volume of export to Azerbaijan in 2007-2013 increased by 13% compared to the previous year and by 417% in 2007.

Figure following on the next page

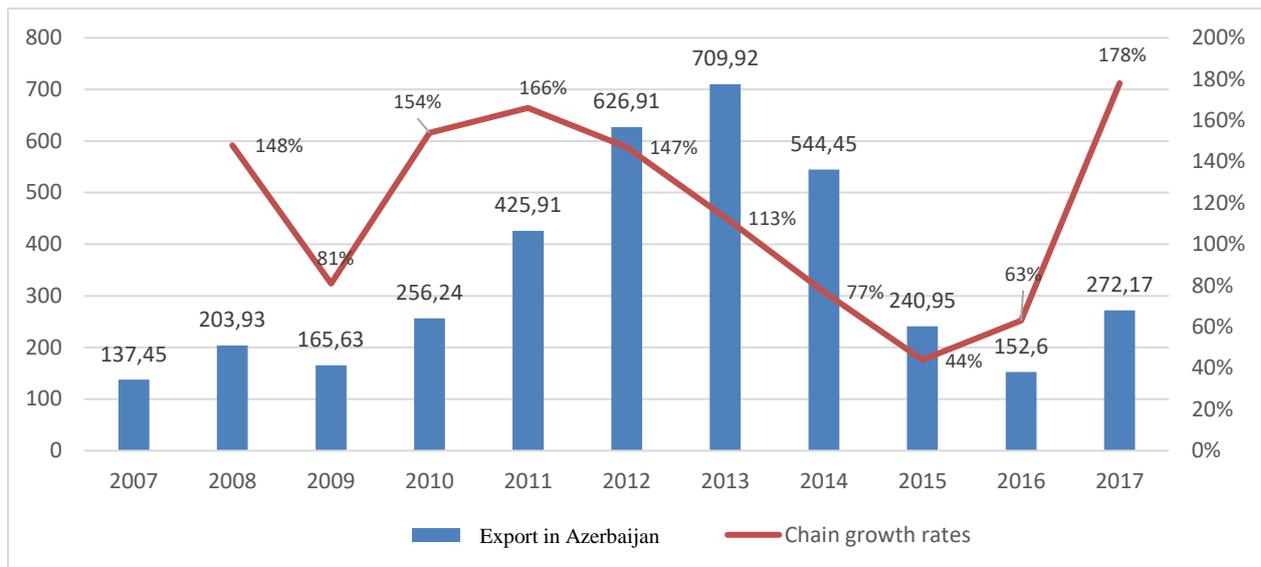

Figure 1: Export performance in Azerbaijan 2007-2017 (Million USD)

Source: National Statistics Office of Georgia

After 2013 the export index starts to decline, decline trend after 2016. In 2017, the export flows sharply increased comparing to the previous year. It is enough to point out that in 2017, only Expo Azerbaijan increased by 78% in comparison with the previous year. Average volume of exports amounted to 272.17 mln. US dollars.

2.1. What is the export trademark with Azerbaijan?

It should be noted that export goods are very profitable. Alcoholic drinks - Exports totaled 126.6 mln USD at the end of last year, from CIS countries to 82.6 mln. US dollars. Azerbaijan has a 6% market for spirits, and specifically 9% of the CIS market. Exports of alcohol in Azerbaijan in 2017 were 7.1 mln. USD. Potatoes - Exports in CIS countries amounted to 5.2 million US dollars, from which export flows were mainly made in the following countries: Azerbaijan (97%) - 5.04 mln. US dollar, Russia (2%), Armenia (1%) - 0.05 million. USD. Non-alcoholic beverages - volume of exports amounted to \$ 17.9 million in 2017, including 15.7 million in CIS countries US dollars. Exportation of non-alcoholic drinks to Azerbaijan to 6 million at the US Dollar rate. The export of live poultry - in 2017, 1.2 million USD, 93% of which were made in Azerbaijan. Curry Fruits - Export Volume 4.4 million US dollar was estimated at 4% - 0.2 mln. US dollars were exported to Azerbaijan. Cigarettes - Export of the product to the last data was 41.8 mln. US dollar, the majority of which is 59%, was transferred to Azerbaijan. Ferro Alloys - the CIS market in 2017 was implemented by 135.5 million. Exports of US Dollar Ferro-Alloys, 4% - 5.42 million US dollar was exported to Azerbaijan. Exports of automobiles are still active, with a volume of 234.9 million US dollars in 2017. The main exporter of this product is Azerbaijan, with the volume of exported products amounting to 88.2 million. US dollar amounted to 38% of total exports and 48% of the CIS market. Exports of trucks in CIS countries were 12.2 million USD. of which 23% were exported to Azerbaijan. The volume of exports of medicines is quite large. In 2017 the export volume of the product is 140.6 million. USD, 22.3 million of which was exported to Azerbaijan, representing 17% of the entire market and 16% of the CIS market.- 6 million in the CIS market. US dollar cyanides and oxyxian exports, 62% of which were made in Azerbaijan. A total of 4.7 million USD cosmetic products were exported in 2017, of which Azerbaijan's share was 10%. Exports of rubber pneumatic salts from Georgia amounted to 5.4 mln. US dollar amounted to Azerbaijan's share of 90%. etc. It is interesting, what is the export share for Georgia and Azerbaijan in GDP? According to the data of 2016, this figure is 46,45%, while export in Georgia is 43,48%.

If we analyze the dynamics, we will see that from 2011 to 2015 the share of export to Azerbaijan was gradually reduced in GDP, but in 2016 it increased by almost 10 percent and in different cases in Georgia. Since 2011, the share of export share in GDP is systematically growing. Compared to the previous year, it is decreased by 1.3% in 2016.

2.2. What is interesting about the importing commodity structure?

According to the data of 2017, the volume of imports in Georgia is 7939.3 mln. US dollars. As for Azerbaijan, it is in the fourth place according to importing countries. The diagram below shows the dynamics of import data with Azerbaijan, where there is a more or less tendency to be observed. If from 2009 to 2013, import from Azerbaijan increased by 97 million US dollars, an average of USD 54 million has been reduced from 2013 to 2016. In 2017, however, it increased by 16% compared to the previous year.

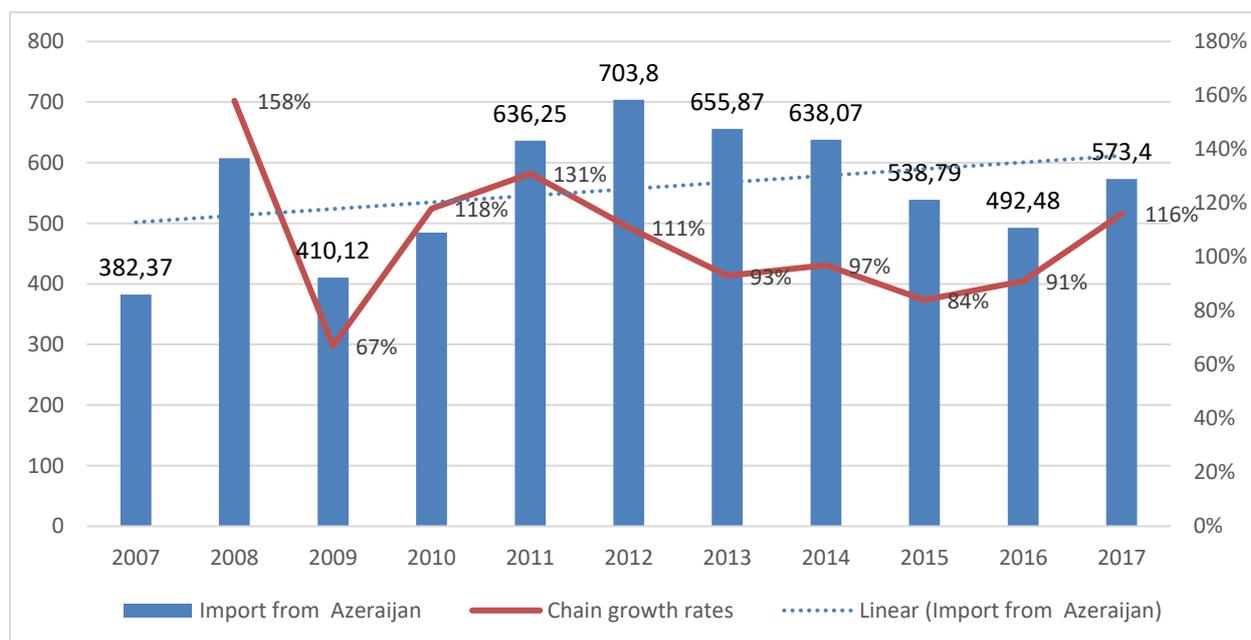

Figure 2: Imports from Azerbaijan to 2007-2017 (Million USD)

Source: National Statistics Office of Georgia

Electricity - main importers of this product are Azerbaijan (71%), Russia (20%) and Armenia (9%). In 2017, 66.7 million. US Dollar imported electricity from which the import markets were presented. In 2017, Georgia imported 696.6 million.USD oil and oil products, including the volume of oil products imported from Azerbaijan by 112.5 million. US dollar. And it is amounted to 16% of the total market and 31% of the CIS market. It should be noted that the volume of oil gases, which amounted to \$ 350.4 billion in 2017, mainly two countries accounting for 91% of Azerbaijan (318.9 million USD) and Russia with 9%. The volume of ores and concentrates is low, it is important to note that in 2017 the import of this product is 383.3 million US dollar and amounted to 8% of which transferred from Azerbaijan. Its volume is only -19.8 mln. US dollar and amounted to 5% of the total market. The size of import of vegetable oil from Azerbaijan is quite small (6%) in total volume of imports. For statistical analysis it is necessary to consider the foreign trade turnover of the countries of the South Caucasus. The chart below shows the volume of trade turnover of Georgia, Azerbaijan and Armenia for 2007-2017 years. While analyzing the above table, it is clear that foreign trade turnover is characterized by a divergent tendency in the interval of 2007-2017. During this period, it is noteworthy that sharp increase or decrease in concrete years have been revealed. However, 2013 is the maximum foreign trade turnover for both countries in a ten-year interval.

In 2014-2016, foreign trade turnover decreased, which is likely to be caused by the current currency fluctuations in the world, but in 2017 we have an increase in comparison with the previous period.

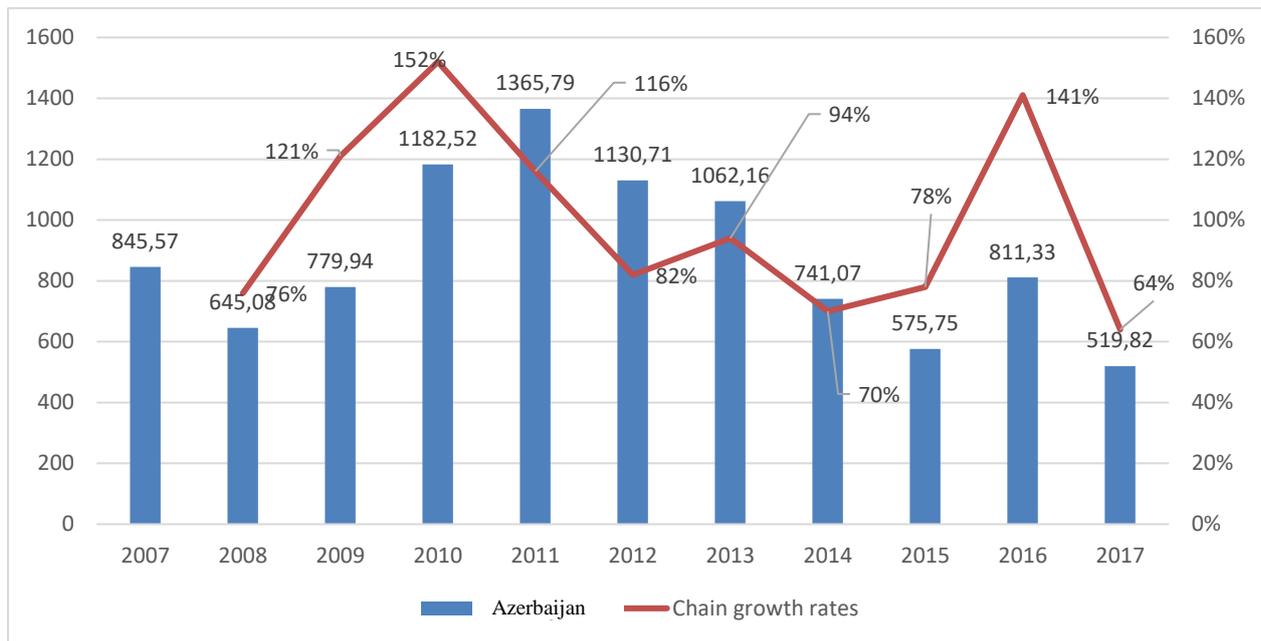

Figure 3: Foreign trade turnover with Azerbaijan 2007-2017 ((Million USD)

Source: National Statistics Office of Georgia

Cooperation in the field of energy and transportation between Georgia and Azerbaijan is strategically important. Projects such as "Baku-Supsa" and "Baku-Tbilisi-Ceyhan" oil pipelines, "Baku-Tbilisi-Erzurum" gas pipeline and Azerbaijan-Georgia Interconnector aim to supply Caspian Basin energy resources to Europe market and "Baku-Tbilisi-Kars" Railway project of Azerbaijan and Georgia with the European Railway Network are of great geostrategic importance of the Black Sea and the Caspian region. Due to the above, Georgia is especially important for its strategic partnership in close cooperation with the Republic of Azerbaijan, in politics, trade, economic, energy, transportation and cultural spheres. Further development of good neighborly relations and mutual cooperation between countries is also very important.

3. CONSLUSION

- Georgia's strategic partner is very important for Georgia to continue close cooperation with the Republic of Azerbaijan in politics, trade, economics, energy, transportation and cultural spheres.
- The trade volume of Georgia is increasingly growing with Azerbaijan;
- It should be noted that according to the data of 2017, Georgia is in the second place by Azerbaijan, followed by Russia and its index is 9,9%, which is 4,6 percent behind Russia;
- The volume of export to Azerbaijan in 2007-2013 increased by 13% compared to the previous year and by 417% in 2007;
- Export goods are very profitable. Among them :alcoholic drinks, potatoes, non-alcoholic beverages, exports of non-alcoholic drinks, curry fruits, cigarettes, ferro alloys and etc.
- As for Azerbaijan, it is in the fourth place according to import countries
- It should be noted that export goods are very profitable. Among them:electricity,oil and oil products, oil gases, ores and concentrates , vegetable oil etc.

Practical importance - The article has great practical significance, since the tendencies of trading economic cooperation expressed here can be used to estimate correct aspects of trade relations between Georgia and Azerbaijan.

THEORETICAL AND PRACTICAL ASPECTS OF THE PARTICIPATION OF CIVIL SERVANTS IN DECISION-MAKING AFFECTING BUSINESS ACTIVITIES

Afag Huseyn

*Department of Economics and Business Administration at UNEC Business School, Azerbaijan
State University of Economics (UNEC), The Republic of Azerbaijan
afag.huseyn@unec.edu.az*

ABSTRACT

Achievement of the goals of social and economic development and the modernization of the governance process require the establishment of mechanisms for more effective management of relations between business and the state. The article theoretically analyzes the necessity of making changes in decision-making process on regulating entrepreneurship during the reforms in the state governance model. Directions of relationships between civil servants and entrepreneurs, mechanisms of conflict of interests have been clarified. Various approaches to the degree of involvement of entrepreneurs, civil servants and political leaders in decision-making affecting entrepreneurial activity, the stages of sequencing the decision-making process, and the opportunities and freedoms granted to civil servants in the decision-making process has been analyzed. The role of human factor in decision-making process, the requirements of the administrative management apparatus, the existing problems in assessing the implementation of decisions has been explained, the systematic approach and the difficulties encountered in the use of situational analysis methods have been indicated. The complexity of grouping existing attitudes and relationships in various structures of the administrative management system, the effects of decisions and goals of the sub-divisions in public bodies on the decision and purpose of the overall state, and the shortcomings that arise during the execution have been identified. In the research process, attention was paid to the experience of different developed countries, comparative analysis, logical summarization and grouping, synthesis methods have been used. Recommendations on improving effectiveness in public administration were put forward, practical proposals were made regarding the preparation, acceptance, implementation and monitoring of enforcement of decisions within the competence of state bodies belonging to the civil service system.

Keywords: *Civil Servants, Decision-Making, Business Activities, Economic Development, Effective Management*

1. INTRODUCTION

Achieving the goals of socio-economic development and modernization of the economy based on innovation, requires finding more effective mechanisms of management of mutual relations and activities of society, business and the state. The formation of a multi-vector system is based on the consideration of the interests of these three, as well as on the harmonization of attempts to meet them. The state, preparing, working out and implementing its policy, is trying to enlist the support of business structures that can influence the social, economic and political processes taking place in society. And entrepreneurs who want to get certain advantages within their interests are trying to get help and patronage of state structures. Obviously, both sides are aware of their dependence on each other and are trying to turn this dependence to their advantage. Currently, the refusal of excessive positions and duties in the state power, as well as the transfer of management in a number of areas to the private sector, is an example of a reassessment of vertical integration. Because, if economic development makes it necessary to conduct a series of changes in business structures, and if these changes are carried out, the invariability of state administrative power will lead to the formation of inconsistencies in the overall organization,

as well as to the formation of even greater problems in administration. The objectives of the state's economic policy coincide with the objectives of state regulation only if the main goal of the economic policy is to solve only those problems that the market itself cannot solve. The importance of economic policy reflects the essence and technology of public administration. Engaged in studying the role of group interests and characteristics of bureaucratic management in the economic policy of the state, L. Mises, F. Hayek and J. Schumpeter attract public attention to the fact that not adjustable government control can be dangerous. Particularly, J. Schumpeter in his work "Capitalism, Socialism and Democracy" assigns a large place to the role of political institutions. Representatives of neo-institutionalism, although they note that increasing the role of the state in the economy leads to a slowdown in the effective development of the market, they nevertheless accept that the implementation of complex forms of exchange, compliance with the terms of agreements and protection of property rights requires state intervention. But there are also thoughts that the state creates inefficient institutions, and even that particularly interested groups change the "rules of the game" of the market in their favor and get political rent. Having criticized the Keynesians and casting doubt on government intervention in the economy, in the 50-60-ies of the last century the foundations of a new Theory of Public Choice were laid. Supporters of the theory of public choice (D. Black, K. Arrow, E. Downs, J. Buchanan, G. Tullock, M. Olson, D. Muller, R. Tollison, U. Niskanen), having built analogies between the state and the commodity market, analyze the state in terms of the market of a special form (Nureev, 2011, p.2). Since participation in public decision-making and the allocation of public resources often leads to people competing for a place in the management hierarchy, citizens who elect representatives to the highest state administration bodies; deputies who pass laws and officials who enforce and monitor the implementation of these laws are considered as particularly interested persons. At the same time, the political mechanism is considered as a means of reaching a compromise in the clash of interests of various groups (Hardin, 1991; 1995). Proponents of the theory of public choice, widely using the methods of classical liberalism and marginal analysis, began to explore the impact on the economy of government decision-making processes, which, in turn, are areas of research in political science, sociology and law. Thus, a similar analysis between the individual and the state was conducted by K. Arrow in 1951 and 1963 in his book "Social Choice and Individual Values", and between the market and the state in 1962 by J. Buchanan and G. Tullock in the monograph "Calculation of the Agreement: The logical foundations of constitutional democracy." And the relationship between the citizen and the state they considered from the point of view of the "service for service" approach (quid pro quo) (Hardin, 1995; Nureev, 2005). Continuing research in this direction, in 1985, G. Brennan and J. Buchanan in their work "Principles of Rules" compared market and political ordinal rules. The analysis of political "games without rules" and "games by rules" was carried out by commenting on the contractual basis of society (Buchanan, Brennan, 1985). It was noted that, in consequence, in a democratic society, the economy will deter the incessant growth of the state apparatus, and the work of the public administration apparatus will be monitored by civil society. Today, socio-economic and institutional changes occurring in a number of countries indicate the implementation of this approach. "In general, it seems that all reforms, changes and new developments have still not found their way into the mind of citizens. Public organizations and civil servants' stereotypes still continue even though they were shaped in a world that no longer exists. Until now, many have the perception that civil servants work in an environment that is clearly separated from the private sector. In addition, many see civil servants as bureaucrats who lack flexibility and adhere to rules and processes and who are not inclined to serve the individual or citizens' interests. In addition, another popular stereotype is that civil servants are not performing as they should, but are nevertheless receiving preferential treatment in terms of pay and working conditions in general." (Demmke, 2005, p.5)

2. MUTUAL CONNECTION OF THE STATE AND OWNERS

At present, the concept of public choice, which is widely used in economic research, is in some cases interpreted as state, social and public control (Nureev, 2005). Although, speaking of public choice, we mean the choice made by society, i.e. voters (citizens). Also, the concept of public policy is understood as the political sphere of government controlled by society, i.e. not the choice of a socio-economic system by society, but the general choice and interests of all citizens (not groups, but the people as a whole). In fact, state structures are not interested in sharing power with others (owners, citizens), most decisions are prepared and made in a closed environment, and in this case it is impossible to observe the principles of transparency and freedom of choice. But the activity of the state apparatus is always under the keen interest of society, and the bureaucracy acts as an agent producing public services. For this reason, political rent and its features become objects of discussion (4, p. 27). According to V.Tyan, "Political regulators, within the framework of their authority, intervene in the formation of the state apparatus, in particular, in the implementation of official activity by the institutions of state service. Change or complete replacement of staff to improve the efficiency of public services - is the right of government. Either Inefficiency or rationality in government activity is determined by its nature (character) and the terms of the manifestations of this nature (structure)" (Tyan, 2016). A. Bentley and D.Truman offer to look at politics (the political approach of the authorities) as a sphere of competition for various interest groups. In recent years, as a result of the analysis of modern comments, it was concluded that in the scientific and economic space, neither Western nor post-Soviet countries that have become part of the CIS, there are no holistic, generally accepted ideas about such concepts that are put on the agenda in the research as "lobbyism", "GR" (government relations), "PA" (public affairs). Of course, there are much more research related to "GR" and "PA", and each researcher, depending on the subject (citizens, NGOs, political parties) and object (government bodies and any institution that influences decision making) impact, and level of impact when interacting with the state, comments on these terms in different ways. At the moment, gradually replacing lobbyism and becoming more relevant "GR" and "PA" comprehensively characterize the relationship between government and owners. Thus, GR departments of large companies monitor legislation, the activities of legislative bodies and base their work on building mutual relations and communications between all departments of the company and government bodies. As a result, top managers of some large companies continue their activities in government bodies, and government officials are invited to high positions in large companies. In a number of companies, despite the creation of GR departments, the responsibility for communication on important issues lies with managers. In recent years, there has been a tendency to strengthen and stabilize the mutual communication link between the state and business (public servants and owners).

2.1. Relationships between government officials, political leaders, and owners: a conflict of interest

Building a government based on a constitution and capable of introducing an adequate policy in accordance with changing requirements is one of the basic conditions for the process of creating a government. The development of the economy, the definition of the "rules of the game" of market actors requires the creation of an appropriate legislative framework. The transition to a new economic system is associated with the creation of appropriate democratic institutions, the formation of an economic way of thinking of the population and the national mentality in accordance with the new requirements. This can be achieved without creating opportunities for bureaucratic arbitrariness, corruption and other negative cases (8, p.52). The relationship between the public service and the owners should be built on trust, in which both parties are interested. "The public sector as well needs to change its way of thinking.

We must avoid contrasts between public and private sectors. A modern public administration must support growth and competitiveness of the private enterprises. Today the public sector is a burden for the economy. Bureaucracy, high taxation, hyper-regulation, regulatory uncertainty, inefficiency, inability in understanding the problems facing enterprises, inability in understanding how the markets work, delays in the decision processes. Too often we find in the public approach, in the behavior of single civil servants, and in the legislation, hostility towards our world.” (13) At the moment, there is a need for the law to have the maximum opportunity for direct impact. But in conditions of economic reality, this has not been fully achieved yet. The newly adopted laws as well as the previous ones are supplemented by a number of regulations, various rules, orders, instructions, etc. As a result, in addition to the law, a large number of documents are applied to it, which create conditions for the occurrence of artificial obstacles, misunderstandings due to lack of information, deviations from laws and other negative situations. Existing gaps in the laws, as well as the lack of articles to regulate a number of relationships, leads to certain difficulties in managing the economy. On the other hand, ineffective, untimely and unbiased state intervention in the economy can disrupt the general balance. This feature should always be taken into account by the state. Therefore, for the direct impact of the law, its execution and perception, it must be as consistent as possible, detailed enough to regulate the relevant relationships. The list of important tasks for the state service includes: expanding the legal, information and other bases for the development of a democratic state; protection of the institution of special property; assistance to large, hearty and small ownership through the creation of a competitive environment; improving the quality of public services; prevent corruption, combat these incidents and much more. Therefore, in regulating certain economic relations, instead of detailing, there is a need to apply the principles “can do all that is permitted by law” for civil servants and “can do anything that is not prohibited by law” for owners. This approach prevents the exertion of influence beyond the scope of authority, and also allows members of society to make choices, giving them freedom in their activities. Thus, the transition to legal regulation is carried out regardless of the state and government officials and their instructions, as it was in the administrative system of management of the society and its representatives; and by complying with the requirement that in the conditions of market relations, any “activity should be controlled and regulated only by law”. Systematization of legislation, taking into account the country's existing customs and the economic and political situation, depends on the interests and will of the legislator, who forms the system and tries to effectively resolve public relations in this area. Basically, the implementation of economic policy is influenced by the way of thinking of the population, decision-makers, owners, and finally, scientists, researchers. “The human factor has a huge impact on management processes, preparation of decisions, assessment of the decisions of the existing management and assessment of the results of its execution.” (Shahbazov, Hasanov, Mammadov, Nasibov, 2014, p.66) The course of economic processes indicates the growth of economic consciousness, i.e. observes the growth of intelligent behavior adequately real economic condition. The experience of recent years shows that the presence in the country of a sufficient number of factors influencing the formation of the national economy does not ensure the automatic realization of its superiority at the world level. “Public agency missions and operations are also influenced by political philosophies and political philosophies can change dramatically from one election to another and it is often difficult to shield public employees from undue political influence. Markets cause disruptions too of course, but usually not of the politically partisan nature. In addition, there is no natural mechanism such as the pursuit of profit in the public sector to align the incentives of civil service employees with those of the elected political leaders” (Tosterud, p.2). Ultimately, the materialization of superiority is also linked with the fulfillment of promises made by the state.

Studies related to the relationship between business and government structures, as well as changes in political life indicate that political leaders (heads of state) are confronted with the fact that large political groups, whose actions and interests could be foreseen, are currently divided into a large number of small groups. These small groups can very quickly, in a very short period of time, unite, disintegrate, forming for a time, rally around some problem, and it can be difficult to predict. F.Goudnau and V.Wilson tried to reveal the features of a bureaucratic model capable of producing positive results in a democratic society (between the legislative and executive authorities). At the same time, were made attempts to identify the differences between politicians (people holding political positions) and administrative employees (government officials holding executive and management positions). In their opinion, "For the development of democracy, politicians must control the activities of administrative workers, and such subordination should be consolidated at both the individual and collective levels. In this case, the administrative staff will not be able to intervene in politics and will only be able to act in the direction that the politicians indicated to them, to follow the instructions." (8, p.2) The presence of an internal threat to democracy, the formation of new structures of national culture and economy, the emergence of problems of fanaticism and ethnic minorities, the raising of the economy to a new level make it necessary to apply various styles and methods of management.

3. DIFFICULTIES IN ASSESSING THE EXECUTION OF INSTRUCTIONS, A SYSTEMATIC APPROACH AND ANALYSIS OF THE SITUATION

The state makes it necessary to analyze the factors of administrative management complexity and its multidimensionality, not separately, but from the point of view of integrity and interaction, as one derivative of the other. Despite the fact that in the administration of the state, each element has a specific function and purpose, they should be studied as an integral system. On the one hand, this system should be considered as acting, sufficiently resistant for existence in any conditions; on the other, as changing, by virtue of its development. However, in the systems approach there are moments that cannot be explained and analyzed. This is due to a specific mechanism explaining the integrity of the public administration system and determining the type of links in the system. Determining the presence of bonds of various types is not enough. It is necessary to group these connections from the logical point of view as similar and analyze them, bringing them to the form "connection-operation"; however, in practice it is a difficult process. Cause in various structures of state administration it is not always possible to fix these connections. In this case, it is very important to analyze the complexity of the system, its criteria and the importance of these criteria. The problem is considered wholly, taking into account the interrelation and results of relative, individual decisions, which, in turn, is the cause of solving problems by alternative means. One of the basic conditions is the non-contradiction of the decisions and goals of individual downstream departments to common solutions and goals. Although, in practice, in some cases, such contradictions are observed. And this affects the quality of reforms in any area. For this reason, when building a model on the basis of a systematic approach, it is necessary to take into account all factors and relationships (and in some cases, various situations that may arise under the influence of these factors) that may collide in real life when a solution is implemented. When building such a model, one of the main goals is to study how much an action may affect the overall result, as well as how many of which resources and funds may be needed. Despite the need for resources and costs, with a view to continuous development, you need to spend them with savings. At the same time, both external and internal influences must be considered. From this point of view, systemic, consistent and decisive measures recently conducted in the republic with a view to developing the environment of ownership are positively assessed. In addition to the positive, there are a number of factors that impede the implementation of economic policy.

In order for the implemented economic policy to produce the expected result, first of all, it is necessary to get rid of the constraints that are negatively affecting the development of the economic thinking of the people: political ideological, class, religious, psychological, etc., based on common national characteristics. Another obstacle is the inability to correctly calculate the phase of time periods.

3.1. Inability to correctly calculate the phase of time periods

It is obvious that for the implementation of economic reforms it is necessary to conduct a series of specific actions in a certain period of time. Economic processes do not occur instantly and for the implementation of reforms in addition to resources, time is needed for a number of activities. Therefore, in the implementation of reform measures, delays occur, which, in turn, leads to the formation of a length of time that removes the final result from the goal. In general, the governing bodies should know not only the results of economic reforms, but also when they occur, i.e. how long does it take to achieve these results.

3.1.1. The stage of confirming the problem

The time frame that indicates the stage of recognition of a problem is the length of time necessary for politicians and government officials to accept the fact that there is a problem requiring government intervention. But in reality, in most cases, this time span covers more time than necessary. Especially in some cases, the slowness of officials, politicians, scientists, proprietors, researchers in defining and publicizing a problem, their fear to openly admit and report a problem or unwillingness to accept a situation as a problem leads to the fact that this period of time increases, and the problem itself reaches large in size, distributed in society and in the economy, deepens.

3.1.2. Stage of finding a solution

The next step in finding a solution is the time interval between the stage of recognizing a problem and making decisions for its resolution. After the fact that there is a problem, it takes time to prepare and adopt the necessary legal acts, and especially laws. And although the media associate this situation with leaders in power (politicians), the truth is that even a high-ranking leader can become a hostage to the system. The system here means not capitalism, socialism, a market or an administrative body, but bureaucracy. In all democratic countries (England, France, Germany, etc.), the day-to-day work of the authorities, necessary for the adoption of bills, the documents submitted for signature are not prepared by people elected for their posts democratically, but by bureaucrats (people in leadership and administrative public service positions) (Toffler, 2003, p. 311). Political leaders often express their dissatisfaction with bureaucrats and talk about how many difficulties and obstacles they face when executing their plans. And as a cause of discontent are indicated the late reaction of bureaucrat, the accumulation of problems and the inability of bureaucrats to solve them. Studies related to the mechanism of power have shown that managers face the problem of choice only if civil servants cannot agree among themselves. Of course, there are decisions that must be made by the first person (for example, decisions in emergency situations that require increased secrecy) and which are not allowed to be discussed by government officials. But in everyday life, such situations are rare, and usually civil servants choose between several suggested options. In addition, leaders (political leaders) have a more superficial understanding of the problems than government officials (bureaucrats). Social and technical changes lead to problems related to combining several activities. And civil servants (bureaucrats) in some cases, mainly when the problem is related to the direction of activities of several bodies, cannot solve the problem in a fruitful way due to the impossibility or unwillingness to transfer their funds to the budget, authority and rights to others.

As a result, there is not a high-quality performance of the work and the solution of the problem in a fruitful way, but a competitive struggle for the appropriation of state funds. Note that in practice, various special commissions are often organized as a measure for resolving difficult situations. In reality, as well as in the business sphere, the need for the reorganization of public administration is increasing. In such cases, only leaders (political leaders) are able to take power from the hands of state employees (bureaucrats). For example, in the Republic of Azerbaijan, as a result of direct attention to the process of creating a favorable business environment of President Ilham Aliyev and meetings with businessmen, controlling the problem, and also coming into force to eliminate existing provisions that caused discontent, the Law of the Republic of Azerbaijan "On Suspending inspections in the field of entrepreneurship" from November 1, 2015, gaps in the legislation were eliminated (1).

3.1.3. The stage of decision-making and implementation by the public authorities

Decision-making and implementation of measures by public authorities largely depend on the extent to which the public administration body effectively operates. The need for the development of new approaches to decision-making in business development and public administration is growing. The following stages, which are important in the civil service system, should be considered:

1. Collection, processing and analysis of the information essential to the situation analysis; revealing negative and positive aspects;
2. determination of goals and sort by the degree of importance;
3. analysis of the availability of resources needed to achieve the objectives and capacity assessment;
4. choosing the most optimal way of achieving goals, developing alternatives, analyzing and evaluating efficiency;
5. decision making and its implementation, coordination;
6. performance analysis, removal of obstacles and shortcomings;
7. evaluation of results.

One of the issues in the broader media market is the refinement of good politics. The main issue discussed in the economic policy is that states are pre-defined and supported by precautionary measures for each trafficked person, or because of the absence of such cases or the support of the actors to act according to the situation at every stage. "Predefined Guidelines" or "discrimination" in the application of "state-imposed" policies pursuant to economic changes. The key point to be taken into consideration is that if uncertainty arises from the effects of the illness, it must be exploited or abandoned, and that their effects should be considered in advance and timely, ie delayed action should be taken. Other factors that hinder the implementation of economic reform are expectations that are unaccountable and inadequate, inadequate and uncertain. Assessment is complicated and problematic, making it necessary to consider a number of points. This is primarily due to the fact that the repetition of a number of situations is a threat to the short-term existence of insecurity in a long-term period, mainly due to the reputation of the population and its credibility. In other words, the realization of a single decision is affected by the consequences of the occurrence of different moments and the smaller decisions made. Sometimes the adoption of the normative-legal act does not result in its functioning and implementation. Therefore, special measures are needed to implement the decision. For example, as a result of the adoption of the Law of the Republic of Azerbaijan "On suspension of entrepreneurship inspections", the inspections carried out in the territory of the Republic of Azerbaijan for 2 (two) years have been suspended and the General Prosecutor's Office of the Republic of Azerbaijan " On Additional Measures for the State Regulation of the Implementation of the Law of the Republic of Azerbaijan, Laws of the Republic of Azerbaijan

on the Implementation of the Law and Inspections in the Field of Entrepreneurial Activity ", to investigate information on violations of the requirements arising from the Decree of the President of the Republic of Azerbaijan No 660 of 26 October 2015 and to ensure that appropriate measures are taken to detect violations, the Republic of Azerbaijan It is recommended that regular information be provided to the President of his ward (2). Recent research shows that in developed countries, the interaction of business with the authorities is not developed on the basis of individual interviews with civil servants (officials), but rather towards the creation of more stable, long-term communication systems. The development of information technologies in turn creates new opportunities for the business to formulate and implement a strategy for interaction with government agencies. Also, new communication technologies also lead to change in hierarchy of government. That is, some structural units lose their relevance and become unnecessary. Apparently, economic development requires the development of interaction between business and government authorities. As a result, both of them need to take and apply certain features. This in turn leads to structural changes in the background of changes in one.

4. CONCLUSION

The influence of human characters and motives on decisions made at the time of the model of management should always be discussed. The following steps should be taken into account during the administrative decision-making process:

- After the problem has been analyzed, a structured-functional analysis of the decision-making must be carried out, a motivation model should be selected, and methods of restoration, quantitative decision-making and other approaches (methods) should be selected when motivation changes occur;
- The positive and negative aspects of the selected method should be predicted in advance, pre-requisite preparations should be made for negative parties, and measures to alleviate their impact strength should be determined. At the same time, the decision-maker should evaluate the situation correctly and determine which factor is important in this situation and how the outcome of the change (one or more) consequences will ultimately result;
- The person making the decision should have the tools, techniques and skills to achieve the goal.

In a systematic approach, there is a need to define the place and function of social elements (e.g., age, education, gender, lobbying and others), that is, the elements of social interaction, in the public administration system, mostly in structural-functional analysis. In most cases, it is attempting to determine the degree of dependency between the management activity and the interaction of these social factors. Also, the governance of the management activity is not static, but dynamic, with the possibility of relationships between management activity and social factors, i. e., depending on the situation (as the events occur) and the possibility of change. The struggle between civil servants (bureaucrats) and political leaders is inevitable for the management of the system, which leads to the radical reorganization of the bureaucracy, resulting in a change in the relationship between political leaders and civil servants (bureaucrats). Communication plays an important role in this process. Given how much information and knowledge are used in management, more and more society becomes "information and knowledge society", making the management more difficult. Unlike the jurisdiction system, the legislative system is fundamentally subjective. Thus, the texts of the normative acts reflecting them are drawn from the point of view of practical expediency by legislators (law-abiding, often civil servants). Despite the fact that a number of recent events have yielded positive results, the gap between the laws of each of the system and in some cases, contradictions necessitates more attention to the improvement of the law enforcement and

monitoring systems. Thus, the study of the application of the legislation should be systematically implemented, and proposals for improvement of the legislation should be in line with the findings of the legislative basis for the implementation of the legislation, as well as the findings of violations and shortcomings, should be taken into account in order to eliminate gaps in legislation.

CAPITAL MARKETS UNION AND EUROPEAN COVERED BONDS INITIATIVE FOR UPGRADING CAPITAL MARKETS IN THE NEW MEMBER STATES

Ivana Bajakic

*Department of Economics, Faculty of Law, University of Zagreb, Croatia
ivana.bajakic@pravo.hr*

ABSTRACT

Covered bonds represent one of the oldest European financial instruments. Covered bond market started with a need to finance the agriculture and was later focused on a real estate. Today, the covered bond market is one of the largest debt market in the world with EUR 2.5 trillion in outstanding amounts, representing a cost-effective source of funding for banks in facilitating the financing of real estate loans and public sector loans. It is active in more than twenty different European countries and growing at the rate of 20% annually outside the European Economic Area. Following these trends, the European Commission has identified new set of building blocks for the Capital Markets Union to enhance more efficient cross-border investments across the EU that could support the real economy and job creation. One of these policy measures concerns a regulatory proposal for the European Covered Bond, to be harmonized on the EU level. Based on the analysis of secondary data, this paper aims to serve two purposes. First, it is to disentangle the effects of the proposed EU covered bonds legislation on the European financial system. Second, to research potential costs and benefits for the Central Eastern and South Eastern European financial markets with regard to harmonisation of the European covered bonds legislation at the EU level.

Keywords: *capital markets regulation, Capital markets union, European covered bonds, Central Eastern and South Eastern European capital markets*

1. INTRODUCTION

The covered bond represents one of the oldest European financial instruments. They are rooted all the way back to ancient Greek mortgages followed by Italian and Dutch bonds. Further development has been recorded in 18th century in Denmark and Prussia, followed by most European countries in the 19th century (Schwarcz, 2011, p. 563-564). Covered bond market started with a need for finance the agriculture and was later focused on real estate. Documents state that in the past (as well as the present time) covered bonds proved an important factor for the stability of the financial system. Although covered bond market had experienced a decline during the mid-20th century, due mostly to the strong development of the deposit base (which remained the trend in some Central Eastern and South Eastern European countries to present time) from the mid-1990s covered bonds are experiencing a renaissance, mostly due to the introduction of the single currency and low interest rates (European Covered Bond Council, 2018, p. 131-140). Today, the covered bond market is one of the largest debt market in the world with EUR 2.5 trillion in outstanding amounts, representing a cost-effective source of funding for banks in facilitating the financing of real estate loans and public sector loans. It is active in more than twenty different European countries and growing at the rate of 20% annually outside the European Economic Area, e.g. Australia, Canada, New Zealand, Singapore, etc. (European Commission 2018b, p. 5-8; European Covered Bond Council, 2018, p. 131). Following these trends, the European Commission has identified new set of building blocks for the Capital Markets Union to enhance more efficient cross-border investments across the EU that could support the real economy and job creation. One of these policy measures concerns a regulatory proposal for the European Covered Bond, to be harmonized on the EU level. The purpose of this paper is to research the policy developments under the Capital Markets Union,

taking special emphasis on the latest policy proposal on the European Covered Bonds legislative initiative by the European Commission and the effects it might bring for the European capital markets. The paper also examines more closely the possible outcomes the initiative might generate for the new Member States, namely Central Eastern and South Eastern European countries and their capital markets. Following short introduction, the paper provides an overview of the Capital Markets Union and European Covered Bond legislative initiative while the third part explores potential costs and benefits of this policy action. The fourth part examines trends on the Central Eastern and South Eastern European capital markets with regard to European covered bond market developments while chapter five summarises the main conclusions.

2. THE CAPITAL MARKETS UNION AND THE EUROPEAN COVERED BONDS LEGISLATIVE INITIATIVE

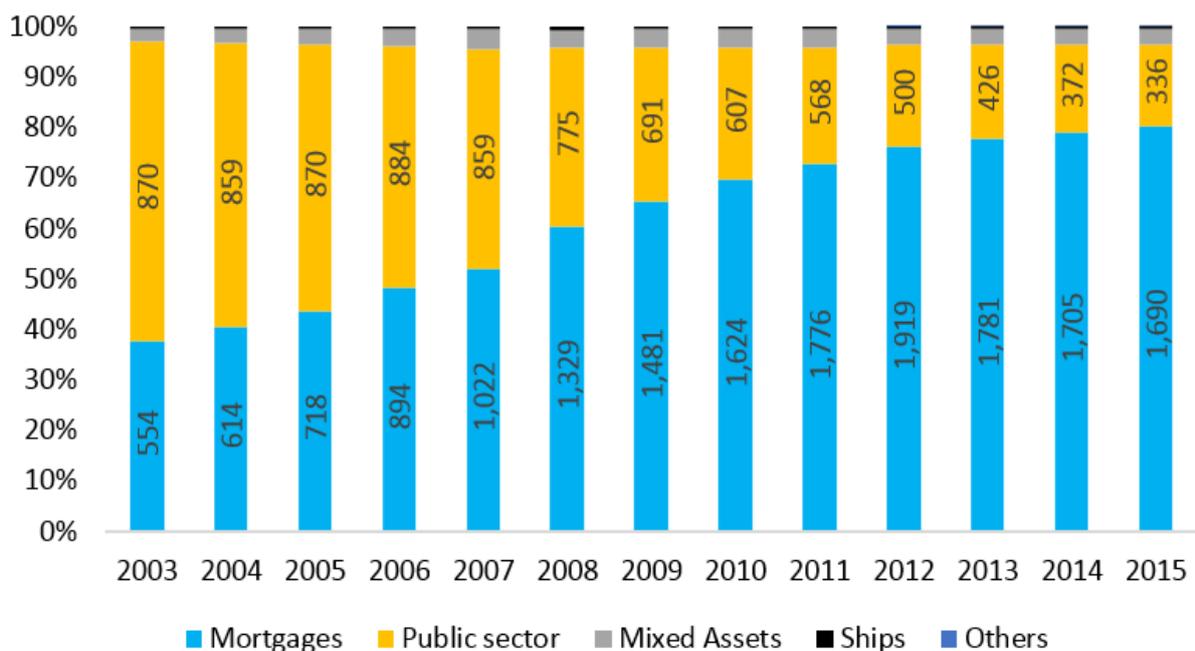

After many decades of minimum harmonisation in the EU (Ferran, 2004: 1-7; Moloney 2008: 11-16) for various reasons and obstacles (e.g. Shuangge, 2013), the 1990s represent a new trend of integration process (Bieling, 2006; European Central Bank 2009). The Capital Markets Union is an initiative by the European Commission's President Juncker (2014) to further stimulate European financial integration (European Commission, 1999, 2005, 2009). The Capital Markets Union is an European Commission's policy initiative to develop and promote integrated European capital markets, with its goals identified in the Action plan, to: (i) provide new sources of funding for businesses, especially for small and medium-sized enterprises (SMEs), (ii) reduce the cost of raising capital, (iii) increase options for savers across the EU, (iv) facilitate cross-border investing and attract more foreign investment into the EU, (v) support long-term projects and (vi) make the EU financial system more stable, resilient and competitive (European Commission, 2015a, 2015b). Additionally, the Mid-term review of the Capital Markets Union Action Plan states that three legislative initiatives have been agreed between European Commission, the European Parliament, and the Council of the European Union, namely: new Prospectus regulation, review of European Venture Capital Fund Regulation and European Social Entrepreneurship Funds Regulation and amendments to Solvency II Directive (European Commission, 2017, p. 6-9). Furthermore, there are nine more legislative initiatives pending for the agreement between three above-mentioned European institutions (ibid.). Furthermore, European Commission has identified three new building blocks for the Capital Markets Union. Firstly, European covered bonds, a new regulatory proposal with a goal of promoting cover bond markets as an important source of relatively cheap and long-term funding for banks in order to stimulate market financing (ibid, p. 5-7). Secondly, Commission has legislative initiative to endorse cross-border distribution of investment funds (ibid., p. 15-16). Thirdly, there is an initiative to promote legal certainty in cross-border transactions in claims and securities (ibid., p. 6). Following the Commission's call for advice at the end of 2013, European Bank Authority (EBA) monitored and analysed the functioning of the covered bonds market in the period of two years under the best practices principle and based on two reports, the EBA gave recommendation for legal harmonization of covered bonds at the EU level (Proposal for a Covered bonds Directive, COM(2018) 94 final, p. 6-7). Following the Mid-term review of the Capital Markets Union Action Plan, European Commission conducted series of public consultations and hearings from September 2015 to the end of 2017 with key stakeholders as a preparation phase for the Directive and Regulation Proposal, along with meetings with the Expert Group on Banking, Payments and Insurance and the Financial Services Committee. Consultations confirmed support for principal based legal harmonisation, with certain concerns regarding "one size fits all" model as an obstacle to flexibility of well-functioning national systems (Proposal for a Covered bonds Directive, COM(2018) 94 final, p. 5).

In July 2017, the European Parliament issued a report giving support to the EU legislative initiative. In March 2018, the European Commission launched the Proposal for the Covered Bond Directive. In the following chapters, we will focus more closely on the issue of the European covered bonds and its contribution to the integration of European capital markets through the Capital Markets Union.

3. PROPOSED EUROPEAN COVERED BONDS LEGISLATION AND ITS IMPACT ASSESMENT ON THE EUROPEAN CAPITAL MARKETS

The proposed Covered Bonds Directive provides common definitions on the issue of covered bonds and covered bond public supervision (art 3), also the structural features of covered bonds (art. 4-17), covered bond public supervision and rules regarding use of the “European Covered Bonds” label (art. 18-27). The proposed Covered Bonds Regulation (European Commission, 2018a, COM(2018) 93 final) is amending art 129 of the Capital Requirements Regulation and aiming to strengthen the requirements for covered bonds in the area of preferential capital treatment. Proposal for a Covered bonds Directive defines covered bonds as “a debt obligation issued by a credit institution and secured by a cover pool of assets which covered bond investors have direct recourse to a preferred creditors” (art. 3(1), COM(2018) 94 final). Covered bonds are most commonly issued by banks and represent an important source of cheap and long-term wholesale funding for these credit institutions. Furthermore, covered bonds play an important role in facilitating the financing of real estate loans and public sector loans. Regarding investors, European Commission states that covered bonds represent safe investment because of their “dual recourse” mechanism, i.e. investors are covered by both the assets in the cover pool and also they are entitled as ordinary creditors for any amount not settled with the liquidation of the cover assets (European Commission 2018b, p. 2; Packer, Stever and Upper, 2007). Cover pool frequently comprises of high quality assets, such as mortgage loans and public sector debt (Figure 1). The composition has been shifting in the past 15 years from the public sector debt to more mortgage debt.

2015). Figures in bars are in € billion

Source: ICF (2017) Covered Bonds in the European Union: Harmonisation of legal frameworks and market behaviours, April 2014, p. 24.

European Commission states two general and other specific objectives of the European covered bonds legal harmonization process: firstly, to support Capital Markets Union by allowing banks to support wider economy: (i) to support development of covered bond markets in all EU Member States, (ii) to diversify investor base (see also Figure 2), (iii) enhance cross border investments, (iv) attract investors from outside the EU. Second objective is focused on prudential rules regarding covered bonds: (i) to align structural characteristics of covered bonds across the EU with the risk features underlying the EU preferential treatment, (ii) expand requirements for capital preferential treatment and (iii) address new risk from new liquidity structures (European Commission 2018b, p. 25-27). In the terms of the size and the nature of the market, covered bonds are still dominantly an EU financial instrument accounting for 84% of the global market, although in the last 15 years non-European Economic Area markets had a growth rate of 20% annually. Covered bond markets are active in 23 European countries, while Baltic and few Eastern European countries are preparing to implement proposed EU legislation, Croatia included. Outside the European Economic Area, Australia, Canada, New Zealand, Singapore, South Korea (and recently Turkey) have active covered bond market. Over the past few decades, covered bond market has become one of the most important debt market in the EU, with around EUR 2.5 trillion in outstanding amounts at the end of 2017 and more than 260 issuers (European Covered Bond Council, 2018, p. 131; European Commission 2018b, p. 5-8). Germany represents the largest covered bonds market (EUR 384 billion, in terms of outstanding volume) with around 80 issuers, followed by Denmark (EUR 383 billion), France (EUR 323 billion), Spain (EUR 281 billion), Sweden (EUR 222 billion), Italy (EUR 131 billion), and the UK (EUR 121 billion). The four largest EU covered bonds markets account for around 2/3 of the EU market (European Commission 2018b, p. 6). Although cross-border investments represent around 60% of total investment, these investments mostly take place between countries with similar covered bonds and mortgage legislation, e.g. between Nordic countries (Ibid., p. 19). As shown on Figure 2, banks and central banks represent the largest investors in cover bonds, with central banks raising their share, while investors such as asset managers and insurance companies have somewhat lowered their share, but it still amounts to up to a third. This is mostly due to European Central Bank's quantitative easing policy through asset purchase programmes, which was originally designed to boost liquidity in the banking market, but has also consequently lowered yields, resulting in reduction of asset managers', pension funds' and insurance companies' share in the investor base at the covered bonds market. There is a noticeable lack of retail investors in the covered bonds market, due mostly to high investment costs (minimum denomination is around EUR 100.000), however they are indirectly present through investments in insurance and investment funds (ibid., p. 8).

Figure following on the next page

Figure 2: Investor distribution by investor group (by year)

Source: ICF (2017) *Covered Bonds in the European Union: Harmonisation of legal frameworks and market behaviours*, April 2014, p. 26.

There is a vast majority supporting the harmonization of rules regarding covered bonds at the EU level, in agreement that integrated capital markets provide many benefits. Conducted Impact Assessment identified following benefits: (i) reduction in regulatory fragmentation, (ii) reduction in asset and liability side duration mismatches, (iii) improved process of conducting due diligence and credit analysis of covered bonds, (iv) supporting integrated European capital markets, (v) improved monetary policy transmission, (vi) enhance capital market access to small-medium issuers and (vii) reduce investor's reliance on external ratings (European Commission 2018b, p. 49-54). In quantitative terms, the Impact Assessment has calculated lower borrowing cost, i.e. general annual savings estimated between EUR 1.5 and EUR 1.9 billion (Ibid., p. 42-43). Generally, it is quite expensive to set up and run a covered bond programme. Firstly, direct administrative one-off costs include: IT system set up, cost of prospectus, application and registration fees, investment bank and rating agencies' fees. On average, they range between EUR 590.000 and EUR 1.8 million (cheapest in Poland at approx. EUR 400.000 and most expensive in Denmark up to EUR 3.8 million per programme). Secondly, direct administrative recurrent costs include: staffing costs, back office, cost of cover pool monitor, professional associations (e.g. European Covered Bond Council), registration fee, annual fee for the label, Bond and Security Trustee. On average, they range between EUR 300.000 and 475.000. Finally, supervisory costs are estimated between EUR 70.000 and 100.000 per covered bond programme (ibid., p. 45-49). Regarding potential threats, there were concerns that harmonized EU rules might weaken efficiency and flexibility of the already well-functioning markets (Proposal for a Covered bonds Directive, COM(2018) 94 final, p. 5). In the terms of costs, they include transition costs, e.g. administrative costs for issuers in implementing changes in legal documentation and IT systems. In addition, there are new costs for issuers of the new covered bonds (European Commission 2018b, p. 52). Another downside of the covered bonds market is that it is limited mostly to larger banks, due to high costs of issuing procedure. Additionally, undiversified investor base (Figure 2) means more credit risk that stays within the banking sector.

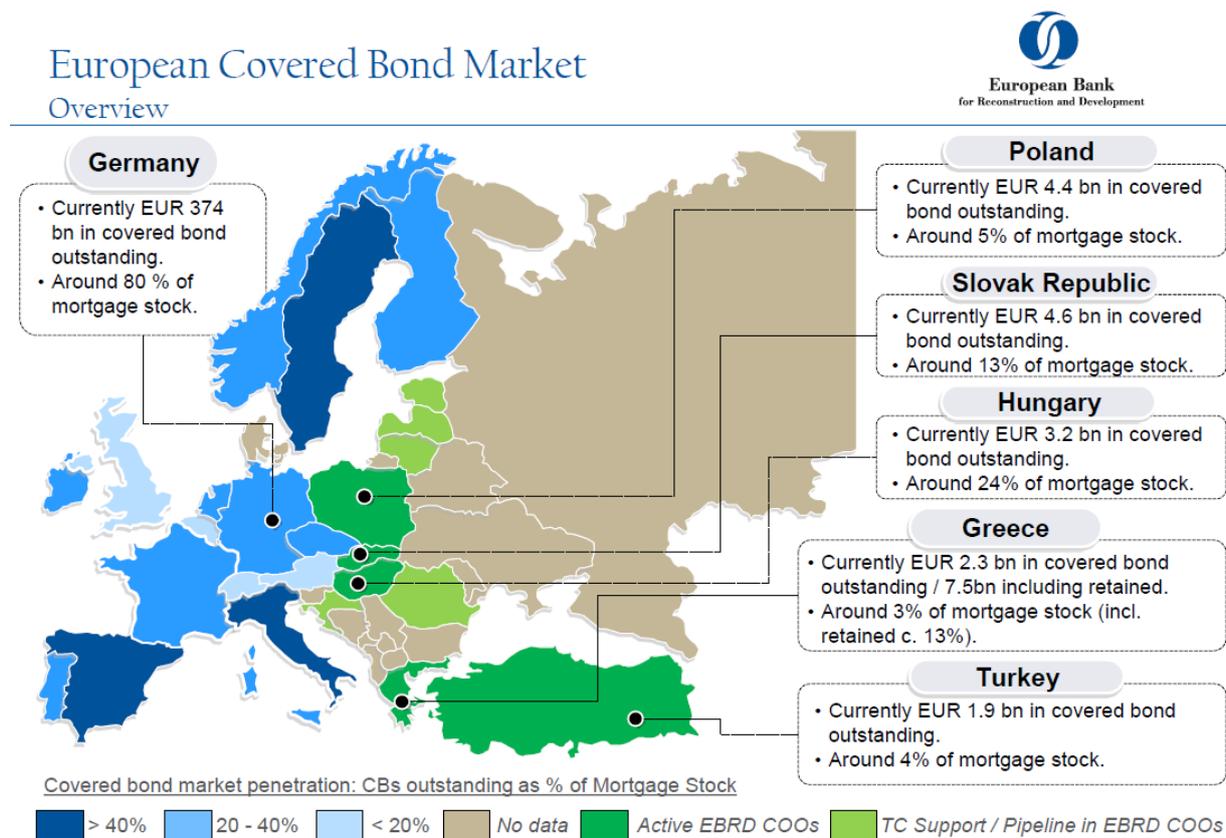

Furthermore, new risks are arising from new financial innovation, i.e. the increased conversion of existing bond from “hard bullet” to “soft bullet” structures extending scheduled maturities and therefore changing structural characteristics of the covered bonds (Ibid., p. 22-23). The regulators aim to address the above-mentioned issues through harmonisation of covered bonds legislation across the EU hoping to promote the trend of diversification of the covered bonds investors’ structure, support more cross-border investments, as well as investments from outside the EU and development of covered bonds markets in all remaining EU Member States (Ibid., p. 14-23).

4. NEW MEMBER STATES PERSPECTIVES – POTENTIALS FOR THE CENTRAL EASTERN AND SOUTH EASTERN EUROPEAN CAPITAL MARKETS

Covered bonds markets are unevenly developed across the EU with four Member States (Germany, Denmark, France and Spain) representing 2/3 of the EU market. In countries like Denmark, covered bond market is more than 200 years old and all real estate mortgages are financed through covered bonds. While some Member States have long-standing tradition of covered bonds markets, most of the new EU Member States have underdeveloped or non-existing covered bonds market. There are three EU Member States having no legal framework nor active covered bonds market: Estonia, Malta and Croatia, while six Member States have legislation in place but no active market: Bulgaria, Cyprus, Latvia, Lithuania, Romania and Slovenia (European Commission 2018b, p. 15-17). The European Commission recognises a big opportunity in advancing capital markets in Central Eastern and South Eastern Europe, stating that these new Member States count for 20% of Europe’s population, 8% of GDP but only 3% of its capital markets (European Covered Bond Council, 2018, p. 85). European Commission’s analysis shows that there is a correlation between level of development of the covered bond market and the size of national banking sectors in the EU. However, the level of development of the covered bond market has no correlation with the ownership structure of the banking sector, i.e. whether the banks are domestically or foreign owned (Ibid., p. 16). Banking sector in the Central Eastern and South Eastern European countries historically has a very strong deposit base system, which makes banks less attentive to alternative sources of additional funding (Breyer, 2004; European Commission, 2018b, p. 17), which was a situation for the old Member States in the mid-20th century. European Commission (2018b, p. 17) stresses that International Monetary Fund and Bank for International Settlement warn that more diversified span of funding sources is needed for banks to be more resilient in cases of financial crisis. The European Commission estimates the benefits from additional issuance of covered bonds at around EUR 63 billion (out of EU total of EUR 342 billion) from the new Member States activating its covered bond market (Ibid., p. 41-42).

Figure following on the next page

Figure 3: European Covered Bond Market - Overview

Source: EBRD, ECB, Thomson Reuters, in EBRD presentation “New EU Covered bonds framework – What’s in it for Croatia”, organised by the EBRD and Croatian National Bank on 20th November 2018, Zagreb, Croatia.

Figure 3 provides an overview of covered bond market in the Central Eastern and South Eastern European capital markets in which European Bank for Reconstruction and Development (EBRD) has conducted projects to support development of the covered bond markets. Poland had an unfavourable regulatory architecture, which allowed only for mortgage banks to issue covered bonds. The EBRD provided technical assistance and new legislative framework was set up in 2016 to create a modern platform for investments, also backed up by EUR 115 million of the EBRD’s investment in Polish covered bonds market. The EBRD has made other investments in the covered bond market: Greece EUR 110 mil., Slovak Republic EUR 80 mil., Hungary EUR 45 mil, etc., supporting the legislative processes as well (EBRD, 2018). A positive example of a new Member States approach to European covered bonds market creation is an initiative by the Baltic States to form the Pan-Baltic covered bond project. This project is a part of a larger agenda in which at the end of 2016 Estonia, Latvia and Lithuania have decided to create a common capital market. They will act within their national legislation implementation process in a way to be aligned with one another in the area of both regulation and supervision to build efficient and integrated cross-border covered bond market (European Covered Bond Council, 2018, p. 90-92).

5. CONCLUSION

Today, roughly 30% of Europe’s mortgages are funded through covered bonds system (EBRD, 2018). In some European countries like Denmark, it is almost a 100% rate, although this is an example of a long tradition of efficient covered bond market. Most Western European countries are taking advantage of this sophisticated financing mechanism that provides system with more

liquidity, in which Germany, Denmark, France and Spain hold more than 66% of the market, although the covered bond market is growing rapidly in the non-European Economic Area, such as Australia, New Zealand, Singapore and Turkey. Covered bonds have couple of important features, they represent valuable source of cheap and long-term funding for banks while simultaneously playing an important role in facilitating the financing of real estate loans and public sector loans. They are considered a safe investment because of their “dual recourse” mechanism. They have also proven to be significant factor for stability of the financial system. Following EBA’s advice for harmonisation of the covered bonds regulation at the EU level, the European Commission has proposed a directive and regulation on this matter, taking principle based approach in order to allow flexibility of already well-functioning national systems. Initial impact assessments are generally positive, predicting reduction in regulatory fragmentation and more cross-border transactions, better investor protection and more integrated European capital markets. In quantitative terms, European Commission predicts annual savings in lower borrowing costs between EUR 1,5 and 1,9 billion, although there are potential risks arising from new financial innovation and it is generally quite expensive to set up and run a covered bond programme, therefor limiting the market issuers to big players such as banks. European Commission recognises big potential for new Member States, Central Eastern and South Eastern European countries since they amount for only 3% of European capital markets. Although banking sector in these EU Member States historically has a very strong deposit base system, alternative sources of additional funding are known to promote financial stability. The European Commission estimates the benefits of developing covered bonds market at around EUR 63 billion and the EBRD has played a an important role in the region of setting up a modern legislative framework and also investing significantly into numerous Central Eastern and South Eastern European capital markets.

THE CURSE OF TRANSFERS? MODELLING FISCAL POLICY EFFECTIVENESS IN AZERBAIJAN

Khatai Aliyev

*UNEC Empirical Research Center,
Azerbaijan State University of Economics (UNEC), Azerbaijan
khatai.aliyev@unec.edu.az*

ABSTRACT

The article aims to provide a new approach to the modelling of fiscal policy effectiveness in Azerbaijan. Thanks to its natural resource wealth, the country has enjoyed oil boom period during 2005-2015, accompanied with huge revenues which are accumulated in the State Oil Fund of Azerbaijan Republic (SOFAZ). Government of the country started to inject resource revenues to the national economy through fiscal channels massively after 2008. Large amount of oil revenues is transferred to the state budget from SOFAZ. In this article, it is argued that those transfers sharply declined the impact of budget expenditures over non-oil sector economic performance, so called fiscal policy effectiveness. Application of various break point tests to the period of 2000Q1-2018Q1 presents existence of break in 2009Q3. Therefore, periods of 2000Q1-2009Q3 and 2009Q3-2018Q1 are taken separately to assess long-run fiscal policy effectiveness in Azerbaijan. Fully Modified Ordinary Least Squares (FMOLS), Dynamic Ordinary Least Squares (DOLS), Canonical Cointegration Regression (CCR), and Autoregressive Distributed Lag Bounds Testing (ARDLBT) cointegration techniques are employed to estimate long-run models in both periods. Empirical results all together supports the proposed claim that fiscal policy effectiveness has decreased significantly in the second period compared to the first. It is argued that the sharp fall is mostly due to the use of easy gained revenues, so called "the curse of transfers". Results of the study are fairly useful for policy officials to consider while preparing budget proposals under the pressure of low oil prices.

Keywords: *Azerbaijan, direct transfers, fiscal policy effectiveness, non-oil sector, oil revenues, resource curse*

1. INTRODUCTION

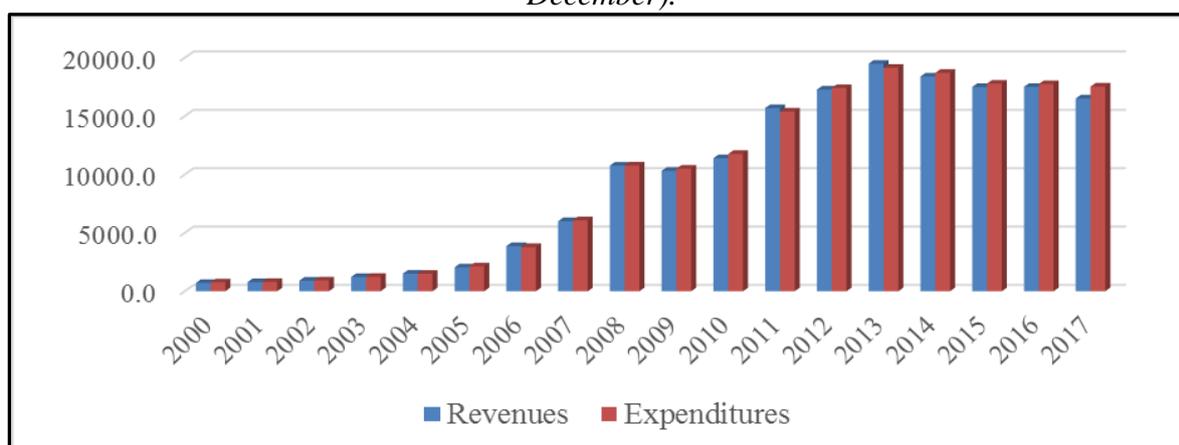

To achieve sustainable economic growth performance is one of the main goal of governments in modern economies Fiscal policy tools are the major channels to stimulate economic growth in the context of Keynesian hypothesis. This may happen through either increasing public expenditures or decreasing tax rates. However, implementation of excessive expansionary fiscal policy can affect fiscal balance and the sustainability of public debt in economies (Afonso and Furceri, 2010). Although the goal is to stimulate economic growth, increasing role of government may affect adversely due to inefficiencies, crowding-out effects, the excess burden of taxation and the distortion of incentive systems (Afonso et al., 2005, 2011). That is effective use of fiscal tools is essential for successful policy implementation. However, that is a challenging issue which is also strongly depend on political-institutional factors (Talvi and Vegh, 2005; Kaminsky, Reinhart and Vegh, 2005; Alesina, Campante and Tabellini, 2008) and corruption level (Dietz, Neumayer, and Soysa, 2007; Andersen and Aslaksen, 2008). Achieving and maintaining effectiveness of fiscal policy implementation is even more complicated in resource rich economies where there is easy gained resource revenues in the hands of government. In such economies, governments provide tax concessions and injects more resource revenues generously to the economy due to their political interests which decreases efficiency and increase dependence from extractive industries (Aliyev and Gasimov, 2018a). This reminds the notion of "paradox of plenty" which could end with being unproductive of

even productive expenditures (Devarjan et al., 1996). From this point of view, negative impact of transferred natural resource revenues over fiscal efficiency should not be surprising. As a resource rich country, Azerbaijan received large amount of oil revenues especially after 2005. The state budget welcomed some portion of resource revenues in the form of taxes and other payments immediately while major part are accumulated in the national sovereign fund, the State Oil Fund of Azerbaijan Republic (SOFAZ). Meanwhile the state budget also received direct transfers from SOFAZ which expanded sharply since 2008 and the increase in budget expenditures are mostly financed by the transfers (Aliyev and Gasimov, 2018b). How this changed the impact of budget expenditures over non-oil sector is disputable. In the context of “paradox of plenty” approach, here, it is argued that fiscal policy effectiveness sharply decreased after 2008 due to excessive fiscal expansion backed by the transfers. Previous studies on Azerbaijan did not consider possibility of break point, just estimated the strength of short and long-run causality from public expenditures to non-oil economic growth (Hasanov, 2013a, 2013b; Aliyev et al., 2016; Dehning et al., 2016; Aliyev and Nadirov, 2016; Aliyev and Mikayilov, 2016; Hasanov et al., 2016; Hasanov et al., 2018; Mukhtatov et al., 2018; Jabrayilova and Aliyeva, 2018; Abbasov and Aliyev, 2018). Only Dehning et al. (2016) have made an attempt to differentiate the impact as before-and-during the oil boom by employing a dummy interaction term. However, fiscal policy efficiency does not immediately respond to oil boom, operates with some lag. Therefore, this approach is a new one which will give more information about fiscal policy effectiveness during 2000Q1-2018Q1 in Azerbaijan.

2. BACKGROUND

To understand the main trend in fiscal policy implementation process of Azerbaijan, it is noteworthy quickly overview dynamics of the state budget indicators during the investigation period. Clearly observed that fiscal tendency has been sharp expansionary after the launch of oil boom until 2013, which turned to be slight contractionary later.

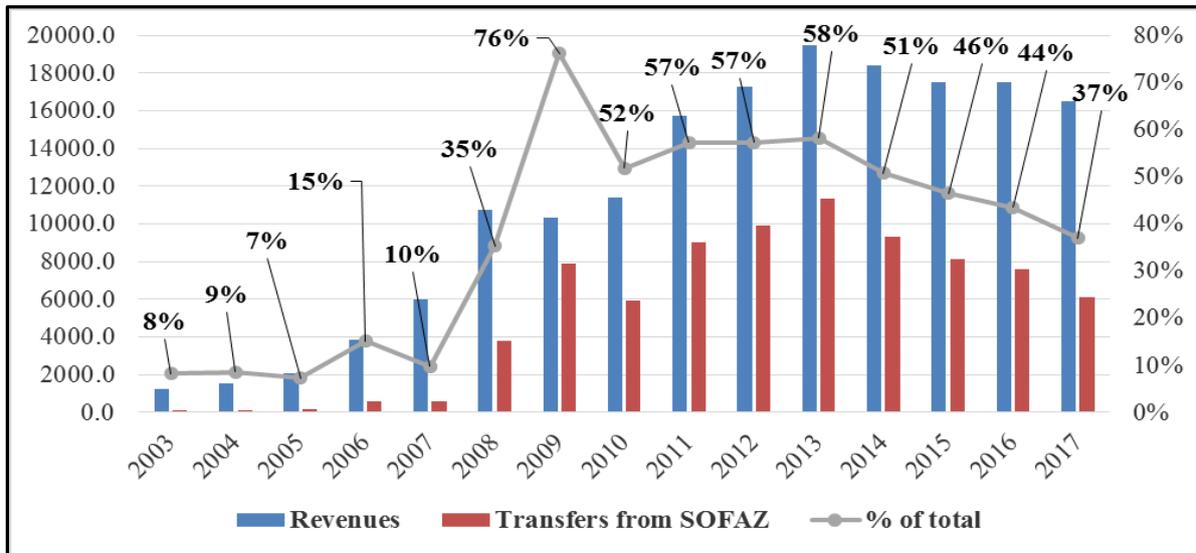

Figure 1: Dynamics of state budget indicators (million AZN) (Adapted from “Statistical Database” by the State Statistical Committee of the Republic of Azerbaijan (2018, December).

Retrieved from <https://www.azstat.org/MESearch/search?departament=10&lang=en>)

However, substantial change in amount of public expenditures has not been due to revenues from sustainable sources. Indeed, expenditures are mostly financed by natural resource related revenues in the form of direct transfers from SOFAZ as well as tax revenues from oil&gas sector (see Musayev and Aliyev (2017) for detailed description of dependence). Figure 2 displays how the share of direct transfers from SOFAZ in total budget revenues has changed overtime.

Figure 2: Share of SOFAZ transfers in total budget revenues (Adapted from “Statistical Bulletin” by Central Bank of Azerbaijan (2018, December).

Retrieved from <https://www.cbar.az/page-40/statistics-bulletin?language=en>, “Reports archive: quarterly statements” by State Oil Fund of the Republic of Azerbaijan (2018, December). Retrieved from and http://www.oilfund.az/index.php?page=hesabat-arxivi&hl=en_US

It is clearly observed that the share has been so small before 2008 when has climbed to 35% and 76% in the following years respectively. Reminding sharp expansionary tendency, change in shares also should be considered as substantial increase in volume of transfers. Thus, volume of transfers has been increased approximately 6.5 time in 2008 and 2.07 times in 2009 compared to the previous year. Reminding “paradox of plenty” issue (Devarjan et al., 1996), it can be expected that effectiveness of budget expenditures to stimulate non-oil economic growth has declined significantly which stands at the center of this research. Results of Dehning et al. (2016) supports this expectation. Therefore, a break in the model after 2008-2009 should not be unexpected.

3. DATA AND METHODOLOGY

The study covers 2000Q1-2018Q1 period. *GDP* is the dependent variable which stand for the amount of total quarterly non-oil&gas output in the country. *BE* displays total state budget expenditures for each corresponding quarter. Another independent variable, *nt_rev* represent total amount of budget revenues left after subtracting the amount of direct transfers from SOFAZ. In other words, *nt_rev* show quarterly amount of non-transfer budget revenues. Remaining two indicators included as control variables are *oprc* and *oprn* denote average quarterly oil price in world market and average oil production amount in the economy for each quarter. Note that *GDP*, *BE* and *nt_rev* are measured as million AZN, converted to real values according to Consumer Price Index (CPI) method at 2000Q4 prices. *Oprc* is in USD and *oprn* is calculated as thousand barrel per day. Descriptive statistics of the variables are given in the table 1.

Table following on the next page

Table 1: Descriptive statistics of variables

Variables	No. of obs.	Mean	Minimum	Maximum	Std. dev	Sum
GDP	73	1926.76	514.95	3617.65	921.62	140653.1
BE	73	1037.82	141.58	2914.85	697.36	75760.63
Nt-revenue	73	598.34	149.39	985.46	262.73	43679.07
Oprc	73	62.63	19.30	121.10	29.57	-
Oprn	73	693.52	274.00	1066.00	275.98	50626.86

To determine if there are breaks in regression models, Bai-Perron tests (Bai and Perron, 2003), Quandt-Andrews unknown breakpoint test (Andrews, 1993), and Chow Breakpoint Test (Chow, 1960) are employed for robustness. To estimate long-run association, Fully Modified Least Squares (hereafter FMOLS) developed by Phillips and Hansen (1990), Dynamic Least Squares (hereafter DOLS, Stock and Watson, 1993), Canonical Cointegrating Regression (hereafter CCR) of Park (1992), and Autoregressive Distributed Lag Bounds Testing (ARDLBT) Approach (Pesaran et al. 2001) are employed. Note that FMOLS is corrected for endogeneity and serial correlation effects while DOLS is corrected for potential simultaneity bias among regressors, and CCR allows to provide asymptotically efficient estimators (Narayan and Narayan, 2004). To identify existence of cointegration relationship in the estimated models by FMOLS, DOLS and CCR, Engle-Granger (Engle and Granger, 1987) and Philips-Ouliaris (Phillips and Ouliaris, 1990) tests are employed. First of all, order of indegration of variables is determined by employing three different unit root tests - Augmented Dickey Fuller (hereafter ADF, Dickey and Fuller, 1981), the Phillips-Perron (hereafter PP, Phillips and Perron, 1988), and Kwiatkowski-Phillips-Schmidt-Shin (hereafter KPSS, Kwiatkowski et al., 1992). Note that ADF and PP tests the null hypothesis of “there is unit root problem”. In contrary, the null hypothesis is “series are stationary” in KPSS.

4. EMPIRICAL RESULTS

Empirical output of the research should start with defining the break dates as this takes the biggest role in the research hypothesis. Results of various breakpoint tests are presented in table 2. Tests altogether identify only 2009Q3 as the break date. Therefore, the period before-and-after 2009Q3 is taken separately as the adopted methodology.

Table 2: Breakpoint test results

	Number of breaks	F-statistic	Scaled F-statistic	Break date	
				Sequential	Repartition
<i>Bai-Perron tests of L+1 vs. L sequentially determined breaks</i>	0 vs. 1*	13.672	95.703	2009Q3	2009Q3
	1 vs. 2	2.029	14.206		
<i>Bai tests of breaks in all recursively determined partitions</i>	0 vs. 1*	13.672	95.703	2009Q3	2009Q3
	1 vs. 2	2.029	14.206		
<i>Quandt-Andrews unknown breakpoint test**</i>					
		Value	Prob.		
		Maximum LR F-statistic	13.672	2009Q3	
		Maximum Wald F-statistic	95.703	2009Q3	
<i>Chow Breakpoint Test: 2009Q3</i>					
		F-statistic	13.672	2009Q3	

Note: * Significant at the 0.05 level; Bai-Perron (2003) critical values are used; Trimming 0.15, Max. breaks 5, Sig. level 0.05; ** Probabilities calculated using Hansen's (1997) method; Trimming 0.15.

Due to estimation of different models, existence of unit root in series for 2000Q1-2009Q3 and 2009Q3-2018Q1 periods is also examined separately. For the first period, PP and KPSS find all variables I(1) without trend while ADF is inconclusive for oprn. When trend is included, ADF finds oprc stationary at level and others I(1). Despite of small confusion, it is possible to conclude that all variables are I(1) for the first period.

Table 3: The unit root tests results

Notes: ADF, PP and KPSS denote the Augmented Dickey-Fuller, Phillips-Perron and Kwiatkowski-Phillips-Schmidt-Shin tests respectively. Maximum lag order is set to 4 and optimal lag order (k) is selected based on Schwarz criterion in the ADF test; ***, ** and * indicate rejection of the null hypotheses at the 1%, 5% and 10% significance levels respectively; The critical values are taken from MacKinnon (1996) and Kwiatkowski-Phillips-Schmidt-Shin (1992) for the ADF, PP and KPSS tests respectively.

For the second period, alternative unit root test results creates some level of confusion. According to ADF test results, all variables are I(1) regardless the trend factor. PP test concludes that GDP, BE, and Nt_rev are stationary at level. Considering KPSS results, only BE is stationary at level when trend is not included. It is possible to take ADF results for the upcoming empirical stages. However, employing ARDLBT approach which allows also to work with combination of I(0) and I(1) series will remove any doubtness over the results due to order of integration confusion. Next stage in the empirical estimation process is to test for existence of cointegration or long-run association among the variables. Table 4 tabulates Engle-Granger and Phillips-Ouliaris cointegration test results for FMOLS, DOLS, and CCR as well as bounds test outcomes for ARDLBT.

Table 4: Results of the cointegration tests

	Engle-Granger Cointegration test		Phillips-Ouliaris Cointegration test		
	Tau-statistic	z-statistic	Tau-statistic	z-statistic	
<i>2000Q1-2009Q3</i>					
FMOLS	-7.682 ***	-46.427 ***	-7.666 ***	-49.443 ***	
DOLS	-7.682 ***	-46.427 ***	-7.666 ***	-49.443 ***	
CCR	-7.682 ***	-46.427 ***	-7.666 ***	-49.443 ***	
<i>2009Q3-2018Q1</i>					
FMOLS	-4.662 *	-26.145*	-4.712*	-25.307*	
DOLS	-4.662 *	-26.145*	-4.712*	-25.307*	
CCR	-4.662 *	-26.145*	-4.712*	-25.307*	
F-bounds test for ARDLBT					
The sample F-statistic	Sig. level	Pesaran et al. (2001) critical values ($n = 1000, k = 4$)		Narayan (2005) critical values ($n = 35, k = 4$)	
		Low bound	Upper bound	Low bound	Upper bound
2000Q1-2009Q3: $F_W = 8.0838$	1%	3.29	4.37	4.09	5.53
	5%	2.56	3.49	2.95	4.09
2009Q3-2018Q1: $F_W = 10.6435$	10%	2.2	3.09	2.46	3.46

Notes: Null hypothesis for both tests is: variables are not cointegrated; ***, ** and * indicate significance of the coefficients at 1%, 5% and 10% significance level respectively; Optimal lag length is selected based on the Schwarz criterion taking 4 lags as a maximum; p-values are MacKinnon (1996) p-values for tau-statistic.

Both employed cointegration tests provide strong evidence about existence of long-run relationship in the estimated models by FMOLS, DOLS and CCR for the first period. Confidence level is always greater than 99% in all cases. Nevertheless, test results indicate weak cointegration for the models of the second period. Null hypothesis of “no cointegration” is rejected only at 10% level of significance. Because confidence level is greater than 90%, it is possible to decide that cointegration also exists in the models by FMOLS, DOLS and CCR for the second period. For ARDLBT, estimated F-statistic value is greater than both Pesaran et al. (2001) and Narayan (2005) critical values at 1% significance level. This means cointegration exists in the estimated model by ARDLBT for both period. Therefore, we can proceed with interpretation of long-run equations which are tabulated in Table 5. Note that residual diagnostics are checked in all estimated models. Residuals are not serially correlated and homoscedasticity assumption is maintained. Meanwhile, there is no functional form misspecification problem. Results of all cointegration methods supports the research hypothesis that there is sharp fall in fiscal policy effectiveness after the launch of massive direct transfers from SOFAZ. Thus, findings reveal that the impact of budget expenditures over non-oil economic growth has been substantially large in the first period compared to after 2009Q3. According to empirical results, 1% increase in the volume of total budget expenditures has triggered economic growth during 2000Q1-2009Q3 by 0.77-1.13%, in average, holding other factors fixed, which all are statistically ($p\text{ value} < 0.01$) and economically significant. Compared to the first period, the impact of 1% increase in the second period has been just around 0.16-0.19%, neither economically, nor statistically significant ($p\text{ value} > 0.10$). Only FMOLS result display weak significance ($0.05 < p\text{ value} < 0.10$).

Note: ***, ** and * indicate significance of the coefficients at 1%, 5% and 10% significance level respectively;

Considering revenue related channel of fiscal policy, the coefficient of *nt_rev* allows to have an idea. Logically and theoretically, the impact should be negative in the context of tax multiplier issue. For the first period, the impact is always found to be negative as expected, but statistically insignificant (*p value* > 0.10). However, for the second period, results reveal “positive” causality from between non-transfer budget revenues to non-oil economic growth. Clearly, this outcome is due to large share of oil sector in generation of non-transfer budget revenues (see Musayev and Aliyev, 2017). Meanwhile, large tax concessions are applied to specific sector of the non-oil sector, for example, agriculture (see Aliyev and Gasimov, 2017) In other words, tax channel has not played a substantial discouraging role in the second period.

5. CONCLUSION

Fiscal policy implementation in Azerbaijan is strongly linked to the performance of natural resource sector. Share of oil related revenues in the state budget is substantially large. Especially, there is sharp increase in amount of direct transfers from SOFAZ to the state budget after 2008. In this context, the article investigates Azerbaijan’s fiscal policy effectiveness and attempts to reveal how the increase in amount of direct transfers affected effectiveness of budget expenditures in terms of stimulating non-oil sector growth over 2000Q1-2018Q1. Because employed break point test results indicate existence of break at 2009Q3, before-and-after the break date is considered separately by employing 4 cointegration techniques: FMOLS, DOLS, CCR, and ARDLBT. Results from all used methods support each other and show the large fall in fiscal policy effectiveness after 2009Q3 compared to previous period. It is found that the impact of public expenditures over non-oil economic growth in Azerbaijan has been

economically and statistically significant within the first (2000Q1-2009Q3) period while neither statistically nor economically significant after 2009Q3, in average. More precisely, long-run response of non-oil sector growth to 1% increase in amount of total budget expenditures is 0.77-1.13% within the first period while it is just around 0.16-0.19% in the second one. The change is substantially large. What is the major reason? Note that the impact of oil price fluctuations and production amount is considered and these indicators are included to the model as control variables. Therefore, "Dutch Disease" effect should not be an influential factor behind fiscal policy effectiveness change. Reminding institutional effects of resource abundance, the major can be the fall in governance quality which was triggered by direct transfers of "easy gained revenues" from SOFAZ to the state budget, in other words, curse of transfers. The research makes very strong contribution to the existing literature with its new approach to analyse fiscal policy effectiveness in Azerbaijan. Policy officials and responsible institutions should carefully analyse expected effectiveness of public spending while preparing budget proposals and determining volume of direct transfers from SOFAZ for the next year.

ABSTRACT

Research in auditing is “on the rise”. Globally research papers related to auditing in top-tier scholarly journals have been growing rapidly from nineties onwards. This paper presents an overview of the existing papers in the field of auditing in relation to Slovenia since auditing has started in Slovenia in 1993 and nothing is known about research related to auditing, its profession and auditing practices in Slovenia. Our overview focuses on any Slovene-related studies in auditing published in journals either in English or Slovene language in period 1993–2018. It seems as from 1993 up to 2010 there existed a “research vacuum” in the field of auditing in relation to Slovenia. There is practically no research papers. Reasons for such a state can only be estimated, i.e. data unavailability, unwillingness to participate in studies, lack of research funding etc. But afterwards from 2011 until 2018 there has been a “(little) boom” in amount of research papers (totally 13 papers) which do contribute to the auditing literature. We discuss some obstacles and limitations and other reasons for this state-of-the-art in the field of Slovene-related research in auditing. Since the existing body of Slovene-related auditing research is not large and varied it can be concluded that a large plethora of research questions are and remain unanswered. These are relevant questions. Some areas where research can provide additional information and add to our knowledge of auditing in Slovenia are listed and some possible future directions of research are given. This overview of existing research is of interest to researchers, especially prospective doctoral students in the field of auditing in relation to Slovenia.

Keywords: *auditing, literature review, research, Slovenia, studies*

1. INTRODUCTION

Scholarly research related to financial statements audits is relatively new (Simunic and Wu, 2009). Globally amount of research papers related to auditing in top-tier scholarly journals has been growing rapidly from nineties onwards (Simunic and Wu, 2009). From 2000 onwards the amount and quality of publication of auditing related research papers has been (dramatically) accelerating year by year (Maijoor and Vanstraelen, 2012; Simnett et al., 2016). Beside unique characteristics and complexities that auditing has (see Simunic and Wu, 2009, for more detailed explanation) for growth in auditing research there exists various reasons: more data availability related to auditing, audit-related market changes, audit-related new technologies and nevertheless additional (renewed) interest in auditing from various stakeholders. In can also be speculated that reasons for growth in auditing-related research are also: availability of practically unlimited computational power, establishment of new scholarly journals, especial growth in number of new specialized journals in the auditing field, and existence of publishing

requirement for doctoral students in the field of auditing and for university professor tenure. Research papers are usually dealing with various economic issues such as auditing market or its segments, audit pricing, audit quality, litigation against auditors, audit practices and also corporate governance and earnings management in relation to auditing. In last few years there has been a number of various literature review papers. Lesage and Wechtler (2012) provided a global overview of auditing research up to 2012. They conducted a content analysis of more than 3 thousand abstracts of auditing research papers from 25 top-tier scholarly journals. They confirm that auditing research is “on the rise”. Furthermore, in the last decade there were various research papers that give in-depth view of state-of-the-art in specific auditing-related field, i.e. research in the field audit quality (Knechel et al., 2013), audit reporting model (Mock et al., 2013), going-concern reporting (Carson et al., 2013), audit fee/pricing (Hay, 2017), auditing at the partner level (Lennox and Wu, 2018), auditors’ professional skepticism and judgement (Hurt et al., 2013, Nelson and Tan, 2005), archival auditing research (DeFond and Zhang, 2014). These review papers usually not only give an overview of previous research but also suggest future research opportunities. Possible research directions are also given in papers such as Simnett et al. (2016), Sunderland and Trompeter (2017), Olsen and Gold (2018), Gepp et al. (2018); especially for countries in EU region in Schilder (1996), Maijor and Vanstraelen (2012). All these lists are not exhaustive. These literature review papers provide a useful global overview of the development of auditing research and specifically in its various related fields, but nothing is known about research related to auditing in Slovenia and its environment. Auditing has started in Slovenia in 1993 and there exist no knowledge about how auditing research has developed and evolved since then in Slovenia. The purpose of this paper is to provide overview perspective of Slovene-related auditing research from 1993 up to 2018. We will shortly overview auditing research over the last two decades in relation to auditing, its profession and auditing practices in Slovenia. We shortly review Slovene-related auditing research from various international scholarly and domestic journals either in English or Slovene language. The remainder of this paper is organized as follows. We start with a glimpse of historical development of auditing in Slovenia and its current state accompanied with some statistical figures. Then we in tabular form shortly present papers that have appeared in various journals and deal with Slovene-related auditing issues. This is followed with discussion including listing of examples of obstacles and limitations for researchers. We conclude with some possible future directions of auditing research in relation to Slovenia.

2. A GLIMPSE OF THE STATE OF AUDITING IN SLOVENIA

Slovenia declared its independence in 1991. Afterwards in 1993 Companies Act was passed which required mandatory auditing of financial statements at least for large and medium-sized companies. Following adoption of Companies Act was the passage of Auditing Act in the same year. Auditing Act laid ground structure and system rules and principles of Slovenian auditing profession. These events mark the start of (modern) auditing in Slovenia and therefore logically auditing (in current form) and auditing profession has a relatively short tradition in Slovenia (Zaman et al., 2017). Before these events there was no (modern) auditing (but note: according to Turk (2009) there was another form of auditing before 1993). In accordance with first Auditing Act principal “guardian” of auditing profession and its development was given to the Slovenian Institute of Auditors (www.si-revizija.si). The Institute did not prepare special national auditing pronouncements, i.e. national auditing standards. Instead IFAC’s International Standards on Auditing (ISA) were enforced and are translated in Slovene language. These later became obligatory under EU pronouncements; Slovenia became European Union (EU) member country in 2004. Since auditing was “new” in Slovenia in 1993 there was no (certified) auditors. Since then the Institute prepares and maintains educational program for training and examination of certified auditors.

The Institute also licenses certified auditors and sets necessary requirements to maintain active license. One of main requirements is continuing professional education of certified auditors. To state bluntly first Auditing Act did not require any public oversight of auditing profession. Amendment of Auditing Act in 2001 changed this and a form of peer-to-peer review was introduced under the supervision of the Slovenian Institute of Auditors. Later in 2008 this form of supervision was abandoned with amendment of Auditing Act that enforced establishment of states' Agency for Public Oversight of Auditing (www.anr.si) in 2009. Reason for amending Auditing Act was in recent changes of EU pronouncement. Since 2009 the Agency has to carry out public supervision over the quality of audit services (Zaman and Valentinčič, 2011). Since 1993 until 2018 audit market has changed considerably. To give some statistics. Currently there is around 50 audit firms (51 on cutoff date 31st December 2017); number of audit firms was constantly slowly raising until around 2010. Audit firms together employ 465 people. There is around 140 active certified auditors (183 active and inactive certified auditors on cutoff date 31st December 2017). Currently is size of audit firms' revenues in Slovenian audit market around 29 million EUR (according to data for year 2016); the highest was in 2009 at 37 million EUR but since then revenues are slowly declining. Two thirds of audit firms' revenues are from (mandatory) financial statements auditing. Ten largest audit firms make around three quarters of all revenues. They also employ around three quarters of all personnel working in auditing sector; but only around 44 percent of active certified auditors. Brief overview of historical development and state of auditing and statistics in relation to auditing give some insight but do not reveal much of auditing, its environment and auditing practices in Slovenia. Auditing research related to Slovenia would give more in depth knowledge and understanding. Therefore we conduct a search for Slovene-related research in auditing.

3. SLOVENE-RELATED RESEARCH IN AUDITING

Our overview focuses on any Slovene-related studies in auditing published in (mostly) scholarly journals in English and Slovene language. Our method of identifying research is the following. Overview of scholarly journals includes overview of top-tier journals in the fields that are related to accounting and auditing. We use web-based search engines among various databases that usually include English-only language entries (i.e. metaiskalnik.izum.si, using the following combination of key words for search: `audit* AND Slovenia*`). Since our decision was to conduct a wider range overview we also include overview of studies published in Slovene language in various local journals. These journals are not included in before mentioned databases and therefore not reachable with the use web-based search engines. Our overview includes following journals in Slovene language: *Revizor*, Journal of auditing (published jointly by: Slovene Institute of Auditors and Association of Accountants, Treasurers and Auditors of Slovenia, 1990–2012); *SIR*IUS*, Journal for the theory and practice of auditing, accounting, taxation, finance, valuation, and other related fields (www.si-revizija.si/publikacije/revija-sirius); published by: Slovene Institute of Auditors, from 2013 onwards, superseded journal *Revizor*); and *IKS*, Journal for accounting, taxation and finance (www.revijaiks.si); published by: Association of Accountants, Treasurers and Auditors of Slovenia; from 1974 onwards). Since first Auditing act in Slovenia was in 1993 our time span was set between 1993 and 2018. Our search for Slovene-related research in auditing is comprehensive. We focus our overview on studies of public accounting profession and external auditing in relation to Slovenia; research papers in related fields of audit committee (i.e. Zaman and Valentinčič, 2011), tax audit (i.e. Jagrič and Lešnik, 2017) and state audit are excluded. Robustness of our search was confirmed with additional search for auditing-related research papers through bibliography among reputable Slovenian authors in the field of auditing, mostly university professors of accounting and auditing (that is University of Ljubljana and University of Maribor). Slovenia is a small country (see various data here); in the specific field researchers and authors are usually well

known. For search among professors we used specialized web-based search engine SICRIS (Slovenian current research information system, www.sicris.si) to retrieve personal bibliographies. For other authors we used general librarian web-based search engine COBISS (www.cobiss.si). Nevertheless we have to add that our search did not include any papers, presentations and proceedings from various local conferences, symposiums, meetings and other form of gatherings. We assume that research papers of sufficient quality first presented at conferences etc. have been later published as papers in any of before mentioned journals. And furthermore, our overview presentation does not encompass various students' theses (i.e. masters' degree thesis and bachelors' diplomas). Since around 2005 in Slovenia students' theses/diplomas are usually publicly available via online university's repositories (i.e. Digital library of University of Maribor, dk.um.si, and The Repository of the University of Ljubljana, repositorij.uni-lj.si) but are in our overview considered as unpublished research. We assume that any students' thesis of sufficient quality has been later published as paper in any of before mentioned journals. Our search did not reveal and to the best of our knowledge there has not been insofar any doctoral dissertation thesis in the field of auditing (and especially in relation to auditing in Slovenia). As shown in Table 1 (publications are distributed by language and by year) the last five years has witnessed a steep upwards in the number of Slovene-related studies in auditing (from 1 publication by the end of 2011 to total of 13 by November 2018). Panel A of Table 1 shows 6 studies are published in English language in 5 journals; panel B of Table 1 shows 7 studies are published in Slovene language in 3 journals.

Table following on the next page

Table 1: Slovene-related research in auditing (1993–2018; source: own research data)

Year	Published research with short abstract		Journal	Theme
A. Published research in English language*				
1	2015	Zdolšek et al. (2015). Study of possibility of forecasting qualification of auditors' reports in relation to the circumstances in the company's economic situation that lead to the qualification.	Economic Research-Ekonomska Istraživanja**	Forecasting model, qualified report
2	2015	Slapničar et al. (2015). Study using between-subject experiment for exploring effectiveness of oversight on selected determinants of auditor's biased opinion.	Economic and Business Review	Bias, financial incentives, personal relationship
3	2016	Zaman and Salihović (2016). Study of audit market concentration for period 2008–2011 in segments of listed and non-listed large auditees. (Study is based on Salihović and Zaman (2015), published in Slovene language.)	East-West Journal of Economics and Business	Audit market, concentration
4	2017	Zaman et al. (2017). Study of the effect of the financial crisis on audit fees in the audit market for the large segment of non-listed companies.	Economic Research-Ekonomska Istraživanja**	Audit fees, panel model, financial crisis
5	2017	Štager and Odar (2017). Study on audit fees data about possible existence of various audit market segments in relation to size of audit company. (Study is based on Čokelc and Štager (2016), published in Slovene language.)	Journal of Global Economics	Audit fees
6	2018	Štager (2018). Study on audit fees data for period 2008–2014 about their in- or decrease and possibility of (permanent) existence lowballing effect. (Study is based on Čokelc and Štager (2016), published in Slovene language.)	Scientific Annals of Economics and Business	Audit fees
Total number: 6				
B. Published research in (only) Slovene language				
1	2011	Skitek (2011). Study of audit fees at initial audit engagements (on sample from period 2003–2005).	Revizor	Audit fees, initial audits
2	2014	Pikelj and Slapničar (2014). Study of audit reports for auditor's signal of going-concern doubt on sample of distressed companies in period 2009–2013.	Bančni vestnik	Qualified report, going-concern opinion
3	2015	Salihović and Zaman (2015). Study of audit market concentration for period 2008–2011 in segments of listed and non-listed large auditees.	SIR*IUS	Audit market, concentration
4	2016	Čokelc and Štager (2016). Study on audit fees data for period 2008–2014 about their in- or decrease and possibility of (permanent) existence lowballing effect.	SIR*IUS	Audit fees
5	2016	Vrtačnik and Zaman (2016). Study of audit fee determinants at initial audit engagements (on sample of large auditees from period 2011–2013).	SIR*IUS	Audit fees, initial audits
6	2018	Črepinšek and Zaman (2018). Study of audit tenure length as possible determinant of auditors' report qualification (on sample of large auditees in 2014).	SIR*IUS	Audit tenure, auditor's opinion
7	2018	Čokelc and Štager (2018). Survey collected data based study of perception of auditees about the quality of financial statements audit and possible determinants of audit quality.	SIR*IUS	Audit quality, determinants
Total number: 7				

Notes: * – Excluded from Slovene-related auditing research is paper of Zdolšek and Jagrič (2011) because it is not related to Slovenia. Their research is based on data from UK and Ireland.

** – Journal with impact factor (according to Journal Citation Reports, Clarivate Analytics).
 Source: own research data (cutoff date: 3rd of December 2018).

As shown by this overview (see Table 1), the existing body of Slovene-related auditing research is not large and varied. Until 2011 there has not been any published papers; it seems as from first Auditing act in 1993 up to 2010 there existed “research vacuum” in the field of auditing in relation to Slovenia. It could be concluded that there exists no written facts/knowledge about the auditing and auditing profession in Slovenia for this time period. Reasons for this state of vacuum can only be estimated. To conduct a research in the field of auditing, researcher has to deal with some common research problems such as unavailability of data (in relation to auditing). Researcher has no access or has only limited access to data in relation to audits and auditing that are possessed by audit firms, auditors and/or regulator (i.e. oversight agency). Even if access is made possible usually audit firms, auditors and/or regulator characterize all data in relation to audits and auditing as sensitive data and therefore do not allow their disclosure (i.e. even in abbreviated form). Second, correlated with data (un)availability is willingness of audit firms and/or auditors to participate in research. They are usually averse to participate in a study. For researcher this is a problem considering that Slovenia has currently (only) around 50 audit firms and around 140 active (certified) auditors; numbers were even lower in the past. Third, for a researcher there is “always-present” problem of research funding. Usually in the field of auditing there is none, which leaves researcher with a problem of how to conduct research with no funding or with very limited funding. These were and are a few reasons why there is only merely a handful of research in the field of auditing in Slovenia. The list is not comprehensive. Additional reasons can only be speculated as for example the following: gap in awareness of problem issues in auditing, methodological issues, including lack of capabilities to tackle with them etc. As already pointed out, there is not any doctoral dissertation thesis in the field of auditing in relation to Slovenia. The field of auditing urgently needs at least few doctoral students who will cope with auditing-related research and publish their papers. Nevertheless this problem is not only present in Slovenia but also in many other (larger) countries (i.e. see Plumlee et al., 2006; Fogarty and Holder, 2012; Plumlee and Reckers, 2014; Boyle et al., 2015). Lack of auditing-related research can also be attributed to the state in Slovenia where until around 2005 there has not been any need for university professors to publish in (non-domestic) top-tier scholarly journals in Slovenia. There was no incentive therefore logically there does not exist any published paper. Additionally, researcher from Slovenia (or any other country) is possibly also struggling with the following issue: why publish ones paper in English language in “foreign” (non-local) journal, usually not widely available to local public. Researcher’s struggle can be summed up in next phrase: “what good will it come from publishing in non-local journal” ... Nevertheless since 2006 onwards for “newcomers” criteria for achievement of professor position are raising, including with requirement to publish in top-tier scholarly journals. Struggling or not to achieve professor position publishing papers in top-tier is necessary for “newcomers”. After 2011 until 2018 there has been a “(little) boom” in Slovene-related research in auditing (see Table 1). In our opinion these group of initial research papers have a (latent) main purpose to increase our knowledge about the auditing and auditing profession in Slovenia. Nevertheless first research papers do contribute to the auditing literature. Slovenian auditing environment, its institutional factors and evolving audit market is an environment where variety of various topics are waiting to be addressed. A variety of topics and issues raised in various research papers (i.e. see Maijoor and Vanstraelen, 2012; DeFond and Zhang, 2014; Simnett et al., 2016; Sunderland and Trompeter, 2017; and other research papers in this papers’ bibliography) have not yet been addressed. To add, almost all published studies are archival studies, except for Slapničar et al. (2015) and Čokelc and Štager (2018). In general researchers of Slovene-related auditing issues have not used methodologies such as questionnaire surveys (except for Čokelc and Štager, 2018), behavioral experimental studies (except for Slapničar et al., 2015) and analytical modeling studies. Use of these methodologies is (urgently) warranted.

4. DISCUSSION AND CONCLUSION

While globally in last few years there has been a number of various literature review papers of auditing research there is nothing known about research related to auditing in Slovenia and its environment. Therefore the purpose of this paper is to provide overview of Slovene-related auditing research papers from various international scholarly and domestic journals published either in English or Slovene language in period from 1993 up to 2018. Our overview reveals there until 2011 was a “research vacuum” in the field of auditing in relation to Slovenia. There has not been any published papers. After 2011 there has been a “(little) boom”. Number of published research papers has increased from 1 publication by the end of 2011 to total of 13 by November 2018 in either English (6 studies) or Slovene language (7 studies). Nevertheless we can conclude that number of Slovene-related auditing research is not large. Almost all published studies are archival auditing studies; auditing research that is qualitative in nature is practically unaddressed. This paper further gives some examples of obstacles and limitations for researchers, i.e. data unavailability, unwillingness of various stakeholders to participate in studies, lack of research funding etc. Additional purpose of this paper is also to point out some possible research opportunities in auditing in relation to Slovenia. Research papers can help advance our knowledge about auditing and can be informative for public policy debates (Maijor and Vanstraelen, 2012). But caution is needed because lack of empirical evidence should preclude conclusions reached without data to support them. Globally auditing research studies provide various outcomes and findings. But researchers, regulators and practitioners need to exercise caution when interpreting the conclusions of extant studies (Lennox and Wu, 2018). This is especially true when interpreting conclusions reached on a data for a large country (i.e. USA) to a small country (i.e. Slovenia). Therefore Slovene-related studies in auditing must have a general need to make meaningful contributions to the existing literature in the field. Studies can encompass various research questions that in relation to auditing in Slovenia have never been tested but are warranted. In example in the following areas: audit quality, audit market and its concentration, audit pricing, demand, audit firm practices and governance, segmentation and differentiation at various levels, auditor partner practices, education and skills etc., employee turnover problems and public oversight of auditing. This list is not exhaustive. Researchers can cope with research questions in various other fields that are relation to auditing in Slovenia. Any additional research can help advance our knowledge and provide at least some information. We hope this short overview will build awareness of the challenges in undertaking research in relation to auditing in Slovenia and help researchers coping with such research. We aim to start and encourage an upwards trend of Slovene-related auditing research.

ABSTRACT

The paper analyses financial indicators of 550 R&I-intensive Slovak firms receiving support from the European Structural and Cohesion Funds (SF and CF) in the period 2009–2014. The research tests the hypothesis that assistance from the SF and CF improves economic performance of the supported firms. The research combines data from public and private resources. It applies the Difference-in-Differences evaluation method with the Propensity Score Matching (PSM) technique. The PSM technique was used to create comparable structures of the treatment and control groups. The selection of performance variables reflected their economic importance and data availability. The most important variables included sales, gross operating surplus (profit), total assets, and own capital. Development in financial indicators for supported/unsupported firms between the periods 2012–2014 and 2009–2011 was compared via the t-test. Results of the evaluation indicated that enterprises receiving support from the European resources accounted for better financial results than those of enterprises receiving no support from the SF and CF. The increase in sales in the period 2012–2014 compared to the period 2009–2011 was the most important indicator of improved competitiveness. Sales accounted for the best availability of data. Sales are also a more realistic indicator than profits in the annual accounts of the Slovak companies. Profits are more prone to manipulation in the enterprise accounts. The evaluation exercise was commissioned by the Government Office of the Slovak Republic. Results of the evaluation exercises were transferred to policy recommendations for the 2014–2020 programming period. Firms applying for support from the national public and/or European resources must provide good-quality data on their past R&I spending and financial performance. As to compare the performance of supported and unsupported firms, data on sales and employment seem to be more useful than data on profits, as well as the return on assets and equity.

Keywords: *European Structural and Cohesion Funds, Research and Innovation, Firm Performance*

1. INTRODUCTION

1.1. The case for public support to research and innovation

There are many barriers to research and innovation (R&I) in the private sector. There is substantial uncertainty about future trends in technology and product development. Many firms lack clear awareness with respect to the importance of R&I for long-term competitiveness and profitability. Some firms understand the importance of R&I but have to cope with short-term problems such as genuine credit constraints and/or sudden changes in business cycles. The state can address the abovementioned market failures in many ways. The EU member countries design and apply hundreds of support measures for support to R&I. The vast majority of the support measures take the form of financial support. There are two major forms of financial support to R&I: (a) direct support (grants, subsidies) and (b) indirect support (tax deductions and tax breaks). The ultimate goal of the public assistance to R&I is to improve the competitiveness of companies. Such competitiveness, in turn, is reflected in the improved financial performance of supported firms (i.e. increase in sales and profitability). The national system of innovation of the Slovak Republic accounts for moderate levels of development (Baláž, Frank and Ojala, 2018). The Slovak policymakers used assistance from the European resources to improve R&I performance of the Slovak businesses. The Slovak businesses considerably benefitted from the European Structural and Cohesion Funds (SF and CF). The support was provided under three Operational Programmes: the Operational Programme Research and Development (OPRD), the Operational Programme Competitiveness and Economic Growth (OPCEG) and the Operational Programme Bratislava Region (OPBR). Total support to R&D and innovation-related activities amounted to €427.53m in the period 2007–2015. Did the European assistance improve the competitiveness of supported firms? If yes, what indicators accounted for major improvements? This paper analyses the financial indicators of 550 R&I-intensive Slovak firms receiving support from the SF and CF in the period 2009–2014. It applies the Difference-in-Differences evaluation method with the Propensity Score Matching technique. It combines data from public and private resources. The evaluation exercise was commissioned by the Government Office of the Slovak Republic. Results of the evaluation exercise were transferred to policy recommendations for the 2014–2020 programming period.

1.2. Evidence from evaluation of public policies in research and innovation

There is rich evaluation literature on the effects of public support on R&I, as well as research and development (R&D). The literature is used to focus on synergies between the public and private resources for R&D. Some literature also deals with the effects of public support on performance by private businesses, such as sales, exports, employment and patents. The traditional stream of evaluation supported the view that public support crowds out private resources and, therefore, is inefficient. Public support, at best, may dissipate in higher R&D wages instead of stimulating real private R&D spending (Lokshin and Mohnen, 2013). Wallsten (2000) evaluated the effects of the US Small Business Innovation Research (SBIR) programme in small enterprises. Small enterprises with more employees and that appeared to conduct more research were more likely to receive an SBIR grant, but the grants did not affect employment. Moreover, the grants crowded out firm-financed R&D spending dollar for dollar. More recent evaluation literature points to the complexity of evaluating the effects of public support to R&D. Zúñiga-Vicente, Alonso-Borrego, Forcadell and Galán (2014) conducted a meta-analysis of 77 evaluations in the USA, Europe and other OECD member countries. Approximately 60% of the studies found that public subsidies are complementary and, thus, 'add' to private R&D investment, 20% found a crowding-out effect, and 20% no significant effect of public support on increases of private funding for R&D. Zúñiga-Vicente pointed to vast differences in methodology of evaluation by particular studies.

Most evaluations used panel data and/or considered short-run effects. Few studies examined long-run effects. There are significant data limitations. Few studies were able to distinguish between total and own expenditure on R&D by firms. Some studies targeted high-tech industries only, while others considered all industries. González and Pazó (2008) used a matching design to test the hypothesis that public support to R&D crowds out private investments (sample: 9,455 Spanish industrial enterprises). Their study indicated the absence of “crowding-out”, be it full or partial, between public and private spending. They also found that some firms — mainly small and operating in low-technology sectors — might not have engaged in R&D activities in the absence of subsidies. The firms added public resources to their own resources. Own resources, however, would have been used anyway. Becker’s meta-analysis (2015) came to similar conclusions (2014). Clausen (2009) analysed data from the third wave of the Community Innovation Survey (CIS3) in Norway in 1999–2001. He compared 278 supported firms to 741 unsupported firms via instrumental variable regression. Clausen found that “research” subsidies stimulated private R&D activity mainly by increasing research expenditure, while “development” subsidies in comparison substituted private R&D activity mainly by decreasing development expenditure. Czarnitzki and Lopes-Bento (2013) analysed the potential crowding-out effect on a sample of 3,019 projects supported by the public resources in Flanders in 2004–2010. The authors used both econometric methods and detailed discussions with representatives of the public agency administering the innovation policy instruments in Flanders. Czarnitzki and Lopes-Bento (2013) concluded that (i) the support policies were not subject to full crowding-out, (ii) the treatment effects were stable over time, (iii) receiving subsidies from other sources in addition to the programme under evaluation did not decrease the estimated treatment effect, and (iv) repeated reception of grants did not decrease the magnitude of the treatment effects either. Klette and Møen (2011) examined longitudinal data for 192 Norwegian firms in high-tech industries in 1982–1995. Temporary R&D subsidies seemed to stimulate firms to increase their R&D investments even after the grants had expired. The authors explained this effect via the learning-by-doing R&D activities of the supported firms. Supported firms are more willing to invest in R&D in the future as well. The abovementioned meta-analyses and individual evaluations indicate the complex relationship between public support and private spending on R&I. The relationship may reach from synergic effects via simple complementarity to substitution. Effects of the public support to R&I on private R&I spending may differ according to the (a) type of support (grants versus tax incentives), (b) firm size, (c) ownership type (domestic versus foreign owners), (d) type of financial resources, (e) internal structure of R&D spending (research versus development), (f) history of support, and (g) industry type. Data limitations usually do not allow for identifying all relevant factors impacting upon private spending for R&D.

1.3. Identifying causal effects between intervention and behavioural change by target group

The behaviour of economic agents is impacted by the high number of external and internal factors. Identifying causal relationships therefore is no easy task in social and economic science. Quantitative approaches mostly rely on econometric methods such as matching design, instrumental variable regression and/or Granger causality in time series (Imbens and Wooldridge, 2009). The econometric methods aim at establishing and quantifying causal relationships between economic and social policy measures and behavioural change by specific economic and social target groups (‘economic agents’). In most cases economic agents are individuals, specific social classes, firms, regions and/or countries. A comparison of two agent groups (‘matching’) is a classical method for evaluating causal relationships. The treatment group was a target of an intervention (e.g. firms receiving subsidies from the SF and CF), while the control group received no treatment.

There is a rather strong assumption that firms in control and treatment groups do not differ in most important aspects, such as size, industry sector, previous experience with research, etc. Such an assumption sometimes is difficult to prove. Specific industries account for different profit rates, shares of university-educated workers and/or research and innovation intensities. There is an option to use some statistical techniques, such as Propensity Score Matching (PSM), and match each agent from the treatment group with a ‘mirror agent’ from the control group (for more details on ‘matching design’, see Pearl (2009) and Miteva, Pattanayak and Ferraro (2012)). The PSM method increases comparability of the treatment and control groups in respect of the observable variables. There, of course, is another strong assumption that different behaviour by treatment and control groups is generated solely by the policy interventions and/or observable variables, and there are no unobservable variables in play.

1.4. Research hypotheses, data sources and research methods

Slovak firms supported by the Structural Funds do not provide data on their past R&I expenditure. It is therefore impossible to tell whether the Structural Fund interventions contributed to an increase in business expenditure on R&I. It is, however, possible to test the hypothesis that assistance from the Structural and Cohesion Funds improved economic performance of the supported firms. Improved competitiveness is the ultimate goal of public support to R&I.

1.5. Data sources, data structure and data cleaning

We accessed the National Strategic Reference Framework database to obtain data on firms and projects receiving support from the SF and CF. We identified some 550 firms receiving support for 589 projects. The R&I-related projects were implemented under the OPCEG 1.1 and 1.3, OPBR 2.1 and OPRD 2.2 and 4.2 Policy Measures. The abovementioned 550 firms formed the treatment group. We compared economic and financial data of the treatment group with data for firms receiving no support (control group). The FinStat database contains annual data on 240,000 companies. The database is managed by a private company. It collects financial data from the public registries. The data include annual accounts and financial statements of all Slovak LTD and PLC-type companies. Historical financial data are not available for the vast majority of Slovak companies. The total database includes a sub-sample of several thousand companies whose annual accounts are available from 2009. The sub-sample partly overlaps with the list of 550 Slovak businesses supported by the OPCEG 1.1 and 1.3, OPBR 2.1 and OPRD 2.2 and 4.2 Policy Measures. We commissioned an extract of the financial data for the control and treatment groups. The total sample had 550 firms in the treatment group. Complete data on all financial indicators, however, were available for a limited number of firms in the FinStat database. Sales accounted for the best coverage, while profit accounted for the weakest one. Complete data on sales were available for 117 enterprises, but complete data on return on equity for 87 firms only (Table 1). The effective size of the treatment group therefore varied between 87 and 117 firms depending on the specific financial indicator. The FinStat database also provided data on 4,645 non-supported firms in the period 2009–2014 (control group). We excluded multinational companies (TESCO, Samsung, Volkswagen, etc.) from the control group so as to eliminate the outliers. We also excluded some other companies with extreme increases/decreases in sales and/or profits (outliers). The final sample of the control group contained 4,551 firms.

1.6. Research methods

We used the Difference-in-Differences method to examine effects of the European resources on economic efficiency of the Slovak businesses. Difference in Differences (DiD) is a statistical technique used in econometrics.

It attempts to mimic an experimental research design using observational study data. It calculates the effect of a treatment (i.e. an explanatory variable or an independent variable) on an outcome (i.e. a response variable or a dependent variable) by comparing the average change over time in the outcome variable for the treatment group to the average change over time for the control group.

2. COMPOSITION OF TREATMENT AND CONTROL GROUPS

The DiD method is based on (i) definition of the appropriate time period, (ii) selection of appropriate variables, and (iii) construction of treatment and control groups.

2.1. Time periods

Two periods were chosen to compare the development of economic efficiency in the treatment and control groups over time: 2009–2011 (pre-test period) and 2012–2014 (post-test period). The first calls for innovation and R&D projects were launched in 2008, but spending was extremely slow. The OPRD 2.2 and 4.2 Policy Measures, for example, accounted for a 9% spending rate by the end of 2011. The period 2009–2011 therefore is considered the period with no or minimal intervention. Each of the two abovementioned periods also captured different phases of the economic cycle: boost (2009 and 2013) and boom (2010, 2011, 2012 and 2014) respectively. The average GDP growth was 0.9% in 2009–2011, whereas it was 1.9% in the 2012–2014 period.

2.2. Performance variables

The selection of variables reflected their economic importance and availability in the FinStat database. The most important variables included sales, gross operating surplus (profit), total assets, and equity (Table 1).

2.3. Construction of treatment and control groups

The PSM method was used to create comparable structures of the treatment and control groups. In the statistical analysis of observational data, PSM is a statistical matching technique that attempts to estimate the effect of a treatment, policy or other intervention. The PSM method attempts to find a ‘mirror member’ in the control group in relation to each member in the treatment group. PSM attempts to reduce the bias due to confounding variables that could be found in an estimate of the treatment effect obtained from simply comparing outcomes among units that received the treatment versus those that did not. If one, for example, compares firms with and without support from the Structural Funds, the comparison is likely to generate biased results. Firms participating in the Structural Fund schemes are different from the non-participating firms. Participating firms likely have a higher share of the PLC-type companies. They also account for higher sales and profits (so as to pay for elaboration of the project proposal) and have a longer corporate history than that of non-participating firms. The propensity score allows one to design and analyse an observational (nonrandomised) study so that it mimics some of the particular characteristics of a randomised controlled trial. In particular, the propensity score is a balancing score: conditional on the propensity score, the distribution of observed baseline covariates will be similar between treated and untreated subjects (Austin, 2011). In this evaluation firms in the control group should have similar characteristics to those of businesses in the treatment group (i.e. those supported by the OPCEG 1.1 and 1.3, OPBR 2.1 and OPRD 2.2 and 4.2 Policy Measures). The following variables were tested for inclusion in the PSM score¹:

¹ As to achieve best matching between treatment and control groups the maximal difference between the sample scores („caliper“) was set to 0.05. For more details on caliper setting see: (Austin, 2011).

- Enterprise size by no. of employees (21 categories)²;
- Enterprise size by sales, assets and equity;
- Technology intensity of an industry (NACE, two digits)³;
- Length of doing business in years;
- Indicators of returns on sales and assets (enterprises with higher profitability use to have more resources for R&I activities);
- History of participation in the national programmes of the Research and Development Agency (RDA, binary variable);
- History of participation in the FP7 projects (binary variable);
- History of participation in the SOPIS 1.3 DM a 1.3 SP Policy Measures in the programming period 2006–2008 (binary variable)⁴;
- The R&D stimuli awarded in the period 2009–2014.

The selection of factors was impacted by their relevance and also by the data availability. Enterprise history, enterprise size (by number of employees), participation in the RDA projects, some sectoral variables (medium-low-tech manufacturing, medium-high-tech manufacturing, high-tech manufacturing), and average assets in the period 2009–2014 proved to be significant at the 0.05 level.

3. RESULTS OF EVALUATION

Development in financial indicators for supported/unsupported firms between the periods 2012–2014 and 2009–2011 was compared via the *t*-test (Table 1). The increase in sales in the period 2012–2014 compared to the period 2009–2011 was the most important indicator of improved competitiveness. Sales accounted for the best availability of data. Sales are a more realistic indicator than profits in the annual accounts of the Slovak companies. Profits are more prone to manipulation in the enterprise accounts. Average annual sales increased by €748,541 in supported firms but decreased by €8,752,041 in unsupported firms (Table 1). Both supported and unsupported firms reported decreasing profits in the period 2012–2014 compared to the period 2009–2011. Supported firms reported a decrease in average annual profits by €148,529 and unsupported firms by €382,246. Supported firms reported an increase in average annual assets by €799,603, but unsupported firms a decrease by €2,514,745. An increase in assets impacted upon the return on assets (ROA) in supported firms by 9.61% between the periods 2012–2014 and 2009–2011. ROA increased by 6.48% in supported firms. Average annual equity increased by €341,357 in supported firms but decreased by €219,520 in unsupported firms. Average return on equity increased by 12.13% in supported firms but decreased by 40.53% in unsupported firms in the period 2012–2014 compared to the period 2009–2011. An increase in sales, assets and return on assets was significant at the 0.05 level (Table 1). Computations on equity and return on equity must be observed with care. These indicators accounted for high numbers of missing data.

² Enterprise sizes by number of employees was coded in following way: (0) = 0 employees, (1) = 1 employee, (2) = 2 employees, (3) = 3-4 employees, (4) = 5-9 employees, (5) = 10-19 employees, (6) = 20-24 employees, (7) = 25-49 employees, (8) = 50-99 employees, (9) = 100-149 employees, (10) 150-200 employees, (11) = 200-249 employees, (12) = 250-499 employees, (13) = 500-999 employees, (14) = 1000-1999 employees, (15) = 2000-2999 employees, (16) = 3000-3999 employees, (17) = 4000-4999 employees, (18) 5000-9999 employees, (19) = 10000 – 19999 employees (20) = 20000+ employees.

³ There are six technology classes of enterprises on the NACE 2-digit level: low-tech manufacturing (NACE 10-18, 31, 32), medium-low tech manufacturing (NACE 19, 22-25, 33), medium-high tech manufacturing (NACE 20, 27-30), high-tech manufacturing (NACE 21 a 26), less knowledge intensive services (NACE 45-47, 49, 52, 53, 55, 56, 68, 77, 79, 81, 82, 94-99) and knowledge intensive services (NACE 50, 51, 58-66, 69-75, 78, 80, 84-93). Source: Eurostat, 2018.

⁴ The SOPIS stands for the Sectoral Operational Programme. The SOPIS 1.3 DM Policy Measure supported small (*de minimis*) projects on innovation in 2004-2006. The SOPIS 1.3 SP Policy Measure allocated state aid to the R&I projects.

*Table 1: Financial indicators for firms receiving/not receiving support from the SF and CF
 (authors' computations based on the FinStat database data)*

Variable	Firm type	N	Average	Std. deviation	<i>t</i> ^(a)	Sig. (2-tailed) ^(a)
Firm history (years)	unsupported	114	17.38	6.410	-0.288	0.773
	supported	117	17.61	5.680	-0.288	0.774
Firm size (21 categories)	unsupported	114	7.30	3.100	-1.498	0.135

Source: authors' computations. Notes: (a) the t-values and significance levels are quoted separately for assumptions on equal and unequal variances.

3.1. Limitations of research

The abovementioned computations have some important limitations. Financial data were available for the minority of enterprises in the control and treatment groups. It is impossible to say how the availability of data impacted upon the structure of the control and treatment groups. It can be assumed that the best data were available for medium-sized and large enterprises with a medium-long and long corporate history. Such enterprises likely have better financial results than those of small and/or new businesses in both samples. The PSM results may be biased by hidden variables ('unobservables'). The competitiveness of enterprises may be impacted by a number of factors, such as (1) external factors of sales and costs within specific industries (e.g. prices of inputs), (2) the quality of management in specific businesses, (3) state aid provided to enterprises directly or indirectly (e.g. via re-qualification of employees), (4) the ownership structure and potential for knowledge transfer (domestic versus foreign owners), (5) the position of enterprises within a group of enterprises, (6) the dependence of an enterprise on regional transport infrastructure, and (7) the availability of human resources and other production inputs within a region and/or in international markets.

4. CONCLUSIONS

The results of the evaluation indicated that enterprises receiving support from the European resources accounted for better financial performance than that of enterprises receiving no support from the SF and CF. The evaluation exercise also examined the availability and quality of data. Financial data were collected from external resources and were available for the minority of supported firms. Most Slovak firms try to minimise the tax burden via tax optimisation and/or tax avoidance⁵. Data on sales are much more difficult to manipulate than those on profits. Data on profits and returns on assets and equity therefore should be observed with greater care than those on sales and assets.

⁵ Number of firms claiming no tax liability increased by 40,000 (from 52,000 to 92,000) in period 2006-2012. Trend in tax avoidance continued in later years. The FinStat database indicates that no tax liability claimed 52.3% Slovak firms in 2013 and 43.8% in 2014 (total sample 115,501 firms).

Good-quality data are essential for a meaningful evaluation. For some reasons, Slovak R&I-intensive firms applying for assistance from the SF and CF had no obligation to provide data on their past financial performance. The firms also were not asked to provide data on their past R&I spending. The evaluation exercise therefore could not analyse changes in R&I spending after allocation of the European support. The evaluation exercise implied the following policy recommendations:

- Public intervention improved the competitiveness of supported firms.
- Firms applying for support from the national public and/or European resources must provide good-quality data on their past R&I spending and financial performance.
- As to compare the performance of supported versus unsupported firms, data on sales and employment seem to be more useful than data on profits, as well as return on assets and equity.

IMPACT OF ECONOMIC DIGITIZATION ON THE DEVELOPMENT OF ENTREPRENEURIAL ACTIVITY

Irada Valiyeva Hatam

*Azerbaijan State University of Economy, Azerbaijan
irada_335@hotmail.com*

ABSTRACT

This paper reviews development of entrepreneurial activity and investigates government input for creating favourable environment to businesses. Economic development and business environment are the most important factors in explaining entrepreneurial choice. However, we find that government's systematic reforms most likely digitalization also matter.

Keywords: *digital economy, digital trade hub, entrepreneurship*

1. INTRODUCTION

In the light of recent economic developments in the world, the development of the country's economy, the protection and further improvement of the investment and business environment, the creation of favorable conditions for the expansion of the entrepreneurship sector, increasing the export potential of the non-oil sector, import substitution, and the strengthening of state support to local entrepreneurs is strategic tasks. Systematic, complex steps have been taken in this direction, state programs have been adopted. As a result, according to the World Bank's Doing Business 2019 report, Azerbaijan's position is on the 25th place among 190 countries in comparison with 2017, 32 step forward in 2018, leaving behind many countries in the world leading positions among the Commonwealth of Independent States rising to the world's most reforming country. As a result of more than 70 reform measures, the position of most indicators has increased to a higher level. Significant progress has been made in eight out of ten indicators falling to the top ten in the business start up indicator. These indicators have not been changed in the last two years on the indicator of foreign trade only. This has resulted in increase of attention by the state to that area. At the same time, building of a digital economy is also a strategic task of our country. These decisions include reform measures to promote Institutional Reform and Investment Promotion, as well as to improve the business climate and improve the country's position in international ratings.

2. CREATING FAVORABLE ENVIRONMENT

In recent years Azerbaijan put great efforts in creating business environment for start ups and entrepreneurial activities in non-oil sector. These events includes the establishment of the Economic Reform Analysis and Communication Center on the basis of the Presidential Decree of 8 April 2016, in accordance with the Order of the President of the Republic of Azerbaijan "On the Establishment of www.azexport.az internet portal - Unified Database of Goods Manufactured in the Republic of Azerbaijan" signed on 21 September 2016, creation of "EnterpriseAzerbaijan.com" portal with the Presidential Decree of December 6, 2016, "Strengthening the position of the Republic of Azerbaijan as a Digital Trade Crossroad and Decree No. 1255 of the President of the Republic of Azerbaijan dated 22 February, 2017 "On Additional Measures to Expand Foreign Trade Operations", the establishment of a Single Window Support Center, the State Program on Digital Payments Expansion in the Republic of Azerbaijan in 2018-2020, signed by President of the Republic of Azerbaijan on 26 September 2018, have a major importance. The objectives of the reform of the Center for Economic Analysis and Communication is prepare forecasts for the medium and long-term period, to provide state bodies and institutions with those forecasts, and to organize the promotion of the achievements of the Republic of Azerbaijan in various fields of economy along with macro and

microeconomic analysis and research to ensure sustainable economic development of the country. Among the complex measures undertaken to improve the country's position in international ratings and to increase the business and investment climate availability within the framework of large-scale economic reforms aimed at specific objectives, the Economic Reforms Analysis and Communication Center has launched a single database of goods produced in Azerbaijan - www.azexport.az creation a portal has particular importance. Azexport.az's mission is to provide information on products of Azerbaijani origin and create a favorable platform for their domestic and foreign markets. To carry out this mission, the leading global and local transport and logistics companies integrated into Azexport.az. "Azexport.az integrates with the world's most popular electronic sales networks and exports goods to the world and offers fast and secure payment via VISA, Master Card and American Express card holders. The Azexport.az portal offers a new service to entrepreneurs. Thus www.azexport.az portal selects the most appropriate among tens of thousands of ads on public and private procurement portals and presents them to Azerbaijani entrepreneurs. Entrepreneurs can now clearly see and enjoy the tenders and orders announced in different countries. At the same time, the portal provides relevant support for participation in such tenders. One of the main priorities of the development of entrepreneurship, which is one of the main directions of the new economic policy, is the expansion of exports, the promotion of non-oil products by the Azerbaijani brand and its sale to foreign countries. The Azexport.az portal's technical capabilities have enabled entrepreneurs to address key issues such as supply chains, low logistics capabilities, and high production costs. The Digital Trade Hub of Azerbaijan ("Digital Trade Hub of Azerbaijan ") project, was created which allows registering as a taxpayer in the Republic of Azerbaijan as a taxpayer and their foreign business partners in the electronic form and signing of contracts as well as transboundary electronic services in real-time mode. In terms of entrepreneurs' access to global markets and the use of new technologies, the Digital Trade Hub has an important role. Digital Trade Hub of Azerbaijan is the e-government-private partnership platform designed to further develop the infrastructure of electronic commerce in the country and to strengthen the position of the Republic of Azerbaijan as a digital commerce interconnector in the region. Opportunities of Digital Trade are - the online unified export petition, customs declarations on the opportunities created by the digital trade junction for the business; e-promotion promotion; Free Sales Certificate; transboundary operations; mutual recognition and validation of signatures. The Portal recommends that all procedures required to meet export incentives for entrepreneurs to promote domestic non-oil products be transmitted electronically through the Digital Trade Hub. The service is also done faster and easier through the Online Single Export Application. The Digital Trade hub, which provides a free sales certificate, is based on X-Road technology. This technology is the safest and most secure protocol for data exchange. It is necessary to have a Free Sales Certificate for export of Azerbaijani products to many countries. The Free Trade Certificate is a relatively new regulatory control mechanism in international trade. Azerbaijan is the third country in the CIS that offer this type of certificate. The certificate is compulsory in many countries and is used to secure the safety of products such as food, cosmetics, textile, medical equipment, hygienic means, etc. that are in contact with the human body. The free sale certificate is a document certifying that the exported goods are freely circulated in the Republic of Azerbaijan, certified by the relevant public authorities and bodies and meets the standards. The acquisition of this certificate is voluntary and is made on the basis of the exporters' application only for the goods produced in the Republic of Azerbaijan. Exporters may obtain a free-of-charge certificate in electronic form or on a paper carrier. The procedure for issuing a certificate is not monitored by any additional labs or tests. A range of documents are required for the free sale certificate, including a list of goods required for a free sale certificate, a certificate of conformity and quality certification, a license for the production of goods (under the law), international

identification number - barcode, 2-3 clients, invoices, checks or tax invoices), and so on. Contracts signed with ISESCO, FutureTrust, GazinformService, Asecco, Microsoft, Eastern Partnership Center and Orientswiss contribute to transboundary operations, recognition of mutual signatures, and thereby improving business relations among countries, facilitating E-Commerce and E-Commerce development. Majority of portal users which is total of 1.5 billion visitors integrated into international electronic sales portals www.go4worldbusiness.com, the Gulf and Oceania countries, www.tr4worldbusiness.com, www.tradeindia.com, www.indiamart.com, covering the Indian market, and www.agrorubo.com, specializing in selling agrarian products in CIS countries in recent years. The portal www.enterpriseazerbaijan.com was created by the Economic Reform Analysis and Communication Center (ITICM) in order to ensure sustainable development of entrepreneurial activity as one of the main priorities of the state's economic policy in the Republic of Azerbaijan and to support competitive domestic production in the non-oil sector. The purpose of the portal is to further enhance the attractiveness of the country's investment and increase the availability of alternative funding sources for the development of the economy. The portal is a database of investment projects, startups, property, stock, land and other assets in Azerbaijan, which is regularly updated, easy to use, accessible, safe, fast and affordable. Project developers looking for potential investors and potential investors looking for a job to invest come together at the EnterpriseAzerbaijan.com portal. "EnterpriseAzerbaijan.com" portal has integrated into the Azexport.az, Digital Trade HUB, and "One Window" Export Support Center. "One Window" Export Support Center, which operates under the "Azexport" portal from May 25, 2017, is a joint venture in the Republic of Azerbaijan for the registration and signing of documents, including contracts with taxpayers as well as their foreign business partners, as well as real-time transboundary electronic services. Representatives of state agencies integrated into the Center operate in the service center and exchange information in real-time with information resources. The Center is planning to issue a number of certificates: export certificate for animals, animal origin products and international veterinary, Phytosanitary (re-exported phytosanitary) certificate for export (re-export) of plant and plant products, Quality certificate for exporting food products to European Union countries, certificate of origin of goods origin, Permit for the export of wild fauna and wild flora species, which is at risk of extinction, protection certificate for export of cultural assets, the consent of the export of religious literature (paper and electronic carriers), audio and video materials, goods (products) and other materials of religious content. As a result of these reform measures, several achievements have been achieved to improve the business environment in Azerbaijan. Thus, according to the State Customs Committee information, export of the Republic of Azerbaijan for January- October 2018 amounted to \$ 16.3 billion. During this period, growth in the non-oil sector export was observed in the Republic of Azerbaijan, and exports for the first 10 months of the current year amounted to \$ 1 billion 351 million in non-oil sector. Exports from the non-oil sector increased by \$ 132 million or 11 per cent in January-October 2018 compared to the same period of 2017. In January-October of the current year, exports to Russia amounted to 467.2 million dollars, to Turkey - 293.8 million, to Sweden 114,4 million, to Georgia – 106,5 million and to Kazakhstan - 38.4 million US dollars. In comparison with the same period of the previous year, non-oil exports to Russia increased by 11 per cent to Russia in 10 months, Turkey by 20 per cent, Switzerland to 10 per cent, China to 75 per cent, and to Georgia by 2.6 per cent. In the list of commodities of non-oil sector exported during January-October 2018, tomatoes were the leader with export value of 150 million US dollars. In this list, gold was the third (\$ 68 million) of the first form of polyethylene (\$ 100 million), which was not used in coin cutting and the second and special mass was less than 0.94 with special increase of 15%. Exports of tomatoes increased by 14% compared to the same period last year. In this list with compare of previos year same period polyethylene (68.5 million), with a 2% increase in gold compared to last year, with a

second and a 15% increase in gold (other non-finished forms - 100 million US dollars). Generally, exports of fruits and vegetables totaled 405 million dollars in January-October 2018, which is 8% increase of previous year, exports of plastics and finished products amounted to 95.7 million, exports of aluminum and finished products - 97.2 million, electricity exports - 60 million, ferrous metals exported goods amounted to 64.3 million, cotton fiber exports - 65 million, export of chemical products - 47 million, cotton export - US \$ 19 million. Compared to last year, these products accounted for 2.5 times the cotton fiber. In November of the current year export of non-oil sector was 144 million US dollars. In the list of the most non-oil exported countries in September 2018 the top five countries were Turkey (34.5 million US dollars), Russia (22 million USD), Switzerland (\$ 13.9 million), Ireland \$ 10 million) and Georgia (\$ 7.2 million). Azercosmos has been exporting services to 22 countries of the world . During 9 months of this year, Azercosmos OJSC has earned \$ 16.7 million in sales of satellite and communications services. In addition to products, there was an increase in the export of various services. Azerkosmos has exported 22.4 million worth of services to 23 countries worldwide. Implemented. During 10 months of this year, Azercosmos OJSC has earned \$ 16.7 million in sales of satellite and communications services. During the first 10 months of 2018, the value of export orders to Azexport portal amounted to \$ 433 million. Compared to the same period of 2017, this is a 15% increase. In general, the value of export orders from Azexport.az to 106 countries from January to 2017 amounted to \$ 908 million. Additionally, in the first 10 months, 2420,600 Azerbaijanis from 194 countries of the world, or 6.4 percent more foreigners and stateless persons came to Azerbaijan compared to the same period of the previous year, the value of their transactions through bank cards amounted to 1119 million manat, compared to the same period last year, the value of these transactions increased by 205 million AZN or 25 percent. It should be noted that in January-October 2018, the cost of export through the "One Window" Support Center was more than \$ 124.5 million. At present, more than 10% of the country's non-oil exports are documented at the "One Window" Export Support Center. Physical and legal entities operating in our country are mainly engaged in steel pipes, steel reinforcing rolled steel, steel platinum, precious metal ingots, oxygen bacon, hazelnut kernel, fruit, fruit juices, barley, rootstock, tomato straw, tobacco, frozen slices and shells, sheep bowel, lamb, Dagestan tour, magazines and so on. the relevant documents required for the export of products were submitted. Certified products has been exported to various countries such as Turkey, Georgia, Austria, Russia, Kazakhstan, Iran, Canada, Germany, USA, Turkmenistan, Qatar, Austria, Ukraine, Lithuania, Switzerland, Belgium, Canada, New Zealand, China, Ghana, Malaysia, Uzbekistan, Italy, Israel. During the first 10 months of 2018, the Exporters for Economic Reforms Analysis and Communications Center (ITECM) have been given free-of-charge sales certificates to more than 200 companies including Gazelli Group LLC, Apiaz LLC, Aznar CJSC named after Teymur Ahmadov, Brightman LLC. The activity of the Azexport portal of the Center for Economic Reforms and Communications and the One-Stop Support Center was highly estimated in the report "Business Environment in Azerbaijan 2018" prepared by the European Union. The Azexport portal and the "One Window" Business Support Center are examples of institutional reforms in export diversification.

3. CONCLUSION

Today, macroeconomic stability, favorable investment and business environment protection, development of entrepreneurship, development of the non-oil sector in the country are strategic objectives. Complex systematic steps are taken in this direction. State programs are accepted. At the same time, building a digital economy of this country is also a strategic task. The article deals with a number of issues related to the State's consistent measures on the economic electronization of the economy and their impact on the development of their publicity activities in the direction of these tasks.

CYBER-ATTACKS AND INTERNET OF THINGS AS A THREAT TO CRITICAL INFRASTRUCTURE

Alen Simec

*University of applied sciences Zagreb,
Vrbik 8, Croatia*

ABSTRACT

The Internet of Things (IoT) is the interconnectivity with smart assets that are securely networked over an open, standard network. The full value of IoT is complementing smart, networked assets with contemporary technologies such as scalable computing, information management, analytics, and mobility gives us Internet of Things also known as Internet of Objects. The IoT will foster the development of a number of applications that make use of the potentially enormous amount and variety of data generated by such objects to provide new services to citizens, companies, and public administrations. The Internet of Things is a very real trend and it is just a matter of time before IoT has a significant impact on the way we live our lives.

Keywords: *Internet of Things, Ubiquitous sensing, interconnectivity, Smart environments, cyber-attacks, data exchange*

1. INTRODUCTION

The Internet of Things (IoT) is the interconnectivity of the world around us. We have stepped into a dawn of a new era of Internet of Things also known as Internet of Objects. Machine-to-machine (M2M) communications is at the heart of the Internet of things. The use of interconnected sensors and controls that help us gather and analyse data about the environment, the things that exist within it, and the people that act within it, to improve our understanding and automate previously manual processes. They have suitable protocol stacks that gives to this objects and things ability to communicate with one another and with people that uses them. idea of the Internet of Things suggests that rather than having a small number of very powerful computing devices in your life such as cars, shoes, wallet, mobile phones, oven, refrigerator, bracelet, watch and many other small things. Manufacturers of electronic products have started to incorporate general-purpose computer CPUs into their products, from washing machines to cars, as they have seen that it has become, in many cases, cheaper to do this than to create custom chips. Designers and engineers work closely to make industrial products, and hobbyist “hackers” (in the sense of tinkerers and amateur engineers), by their nature, are a diverse group encompassing various technical and artistic interests and skills.

2. METHODS FOR DEVELOPING IOT INFRASTRUCTURE

Cross-site scripting (XSS) is a type of computer vulnerability which is found in internet applications. They enable access to scripts which are run on the client side in the user's browser. Cross-site scripting is a vulnerability which can be exploited by attackers in order to bypass computer access control [8]. Careless surfing, use of outdated browsing and antivirus software tools, increased activity of spammers, forwarding of links and images over social networking and internet forums, lack of preventive security measures during the development of web applications aid the wide-spread of this attack. Once an attacker is able to find vulnerability associated with a web application, he will be able to attack its web users using this vulnerable web application. Client side scripts like Java Scripts are most widely used for implementing XSS attacks [9]. Privacy is an important issue in IoT devices and service on account of the ubiquitous character of the IoT environment. Entities are connected, and data is communicated and exchanged over the internet, rendering user privacy

a sensitive subject in many research works. Privacy in data collection, as well as data sharing and management, and data security matters remain open research issues to be fulfilled [10].

3. INFRASTRUCTURE AND POSSIBILITIES OF DEVICE INTERACTION

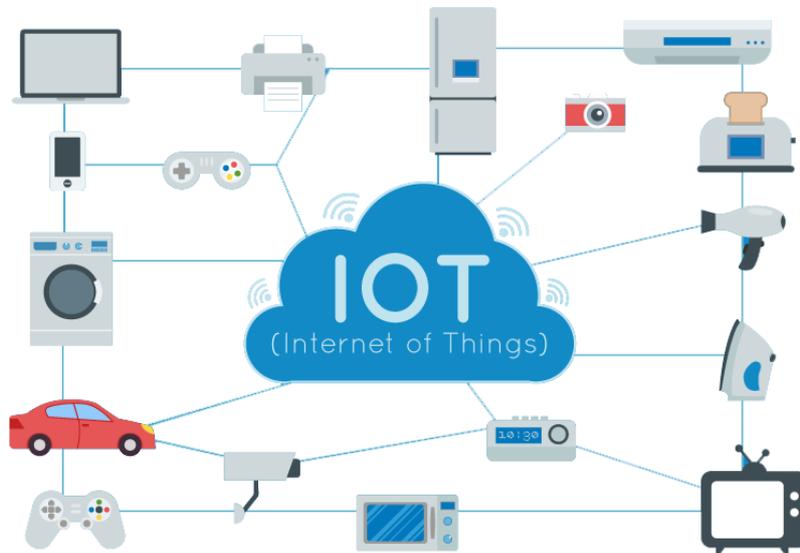

Because IoT involves so many industries, new jobs will be generated and additional value will be increased, which bring chances to social development, including promoting employment and economic development¹. Society also affects IoT development. Modern knowledge systems can be divided into many subjects. Table 1 lists some relative IoT subjects and their corresponding relevance to IoT development.

Table 1: Subjects examples related to IoT

Relevance	Subject examples
Highest	Information and communication engineering, electronics science and technology, control science and engineering, computer science and technology
Very high	Instrument science and technology, mechanical engineering, optical engineering
High	Chemistry, biology, physics, mathematics, transportation engineering, aviation aerospace science and technology, architecture, agricultural engineering, medical technology, pedagogy
Middle	Law, public management, applied economics
Low	Artistic theory, archeology, ...

Figure 1: The future of IoT where all devices are connected and communicating with each other²

Organizations are gaining flexibility to quickly adapt to changes, whether for new product introductions, planned product line changeovers, or other adjustments. Each affected zone, from the enterprise to the plant floor to the loading dock, receives real-time alerts about changes through networked mobile devices, video monitors, and human-machine interfaces.

² Tecrea; URL: <https://tecrea.com.co/blog/2018/08/15/iot-empresas-generan-desarrollo-colombia-mundo> 2018.

The real-time information also links back to the entire supply chain, so each step in the manufacturing value chain, from supply through production to distribution, can respond as quickly as needed.

4. INTERPLAY OF INTERNET OF THINGS AND SOCIETY

As one of the significant emerging technologies, Internet of things has been revolutionizing so many fields including our daily lives, by providing new communication ways between machines. There are 3.4 billion internet users globally and 10 to 15 billion IoT devices and this number is regularly increasing. While internet revolution redefined the modern life and provided unprecedented opportunities, internet of things has brought smart-life with so many smart devices. It transformed every field of daily life, industry and economy. Some of the devices that come with components mentioned above are: kitchen equipments (i.e refrigerator, oven, food processor), home appliances, TVs, cars, lighting and heating products etc. Smart thermostat, for instance, allows users to remotely adjust the temperature by using their mobile phone. In addition to that, as it collects data and interact with other connected devices, it learns user's behaviours to automizes processes for the next time. On the other hand, as improvement of IoT continues, concerns about the information security are increasing. Even though IoT is revolutionary, it comes with some risks. And these concerns are not just a superstition, they are based on some incidents that already taken place. For instance, Proofpoint, a cyber-security company, reported that more than 100,000 smart TVs, refrigerators and other consumer items were compromised by hackers to transmit 750,000 malicious emails in a two-week period³. Smart gadgets are attractive to cyber-criminals and hackers. Because they are connected to internet 24 hours and they are less protected than computers, since users are less experienced and have usually less options for security with them⁴. Technical vulnerabilities can be basic vulnerabilities or application-based vulnerabilities. Technical ones refers to the vulnerabilities of common internet protocols. The core protocols of internet such as IP (Internet Protocol), TCP (Transmission Control Protocol) and HTTP (Hypertext Transfer Protocol) weren't including security features at first when they created, since the Internet used for academical and governmental purposes and users of the internet were trusted individuals and institutions at that time. After a while, security precautions were included to these protocols as extensions with the expansion of the internet. Therefore, the Internet is still vulnerable to basic attacks such as DDoS, eavesdropping, hoaxing and packet sniffing. Apart from core protocols, there are a number of applications, including operating systems, that run on top of basic protocols. These application vulnerabilities are exploited by attackers to gain access privileges to remote systems, steal information and interrupt services. In general, hackers exploit both basic protocols and application vulnerabilities depending on the situation. In order to use the IoT with its full potential and safely, governments and businesses have to meet some requirements. Security and data privacy are the most important vulnerabilities to attacks. Organizations "need clear legal guidelines over data ownership, transfer and usage". "Governments need to collaborate with each other and with industry to harmonize compliance requirements in data and liability laws... This will streamline data flows within a jurisdiction and across national borders". "Operational safety and security practices vary greatly across industry domains. It is important to understand and document existing best practices across industries. This will help identify gaps and requirements for potential innovation, standards or new cybersecurity products."

³ Debruce, O. Proofpoint uncovers Internet of Things cyberattack; URL: <http://investors.proofpoint.com/releasedetail.cfm?releaseid=819799>; 2014.

⁴ 100,000 Refrigerators and other home appliances hacked to perform cyber attack; URL: <https://thehackernews.com/2014/01/10000-refrigerators-and-other-home.html>; 2014.

During the manufacturing process, security must be a built-in aspect of design for both hardware and software. Over time, these should evolve as standards that guarantee a certain level of default security to the systems.⁵

5. CONCLUSION

IoT integrated critical infrastructure brings revolution of opportunities for governments and organizations. Although there are still technological challenges and concerns to handle, this emerging technology will increase the efficiency of modern world. Most important topics are ensuring data privacy and cyber security in order to maintain innovation and growth ideally. Organizations and governments have to be aware of that attacks and vulnerabilities can never prevented completely and should improve their capabilities against cyber-attacks. It will allow organizations to profit opportunities offered by digital world and minimize the risks of danger. The industry recognizes the challenge and is making it the top priority. IoT security is starting to be integrated into the very fabric of both industry and public infrastructure, including fundamental areas such as transportation and logistics, power grids, water supplies, and public safety. However, much more needs to be done. We still lack skills, education, and awareness. Many companies continue to be in denial, still relying on a discredited physical separation approach to securing their plants and infrastructure. Internet of Things is different than Information Technology in many ways, it is more distributed, more heterogeneous, and more dynamic.

ABSTRACT

Clusters are crucial in the development of the economy and in the transition of the country's innovative development. In practice, the cluster approaches are implemented through the cluster policy. Cluster policy involves the adoption of relevant programs and strategies for the development of individual clusters (cluster initiative), as well as the formation of an instrumental database (cluster technology) for the implementation of these programs and strategies. The article summarizes the main characteristics of the cluster, such as the object of economic analysis, the cluster policy and the features of its formation. Cluster policy models are analyzed comparatively.

Keywords: *cluster, cluster policy, cluster strategy, cluster initiative, cluster consulting, cluster technology*

1. INTRODUCTION

Practically cluster approaches are implemented through cluster policies. But according to the general approach, cluster policy is the state's system of actions and mechanisms for the formation and protection of clusters aimed at improvement of the country's competitiveness. However, it should be taken into consideration that the issue of the cluster policy in science has become a subject of discussion. It is regarded as an integral part of an independent or economic policy. Thus, the cluster approach was firstly looked through within the framework of industrial policy in Finland. From a practical point of view, there is no clear definition of cluster policy concept, the genesis of this policy consists of a new industrial policy. According to M. Porter, the improvement policy of competitiveness of the country or region is the strategic focus of the horizontal cluster policy (1).

2. THE NATURE OF CLUSTER POLICY.

Cluster policy involves the adoption of relevant programs and strategies for the development of different clusters (cluster initiatives), as well as establishment of instrumental database (cluster technology) for the implementation of these programs and strategies. In medium range, the main focus of the cluster policy is to establish network-type knowledge to make structural and technological changes, and reconstruct industrial enterprises through attracting enterprises and research institutes involved in this process. The primary task of the cluster policy is to establish an institutional mechanism to ensure the development of the economy on a cluster basis at national and regional levels (Figure 1).

Figure following on the next page

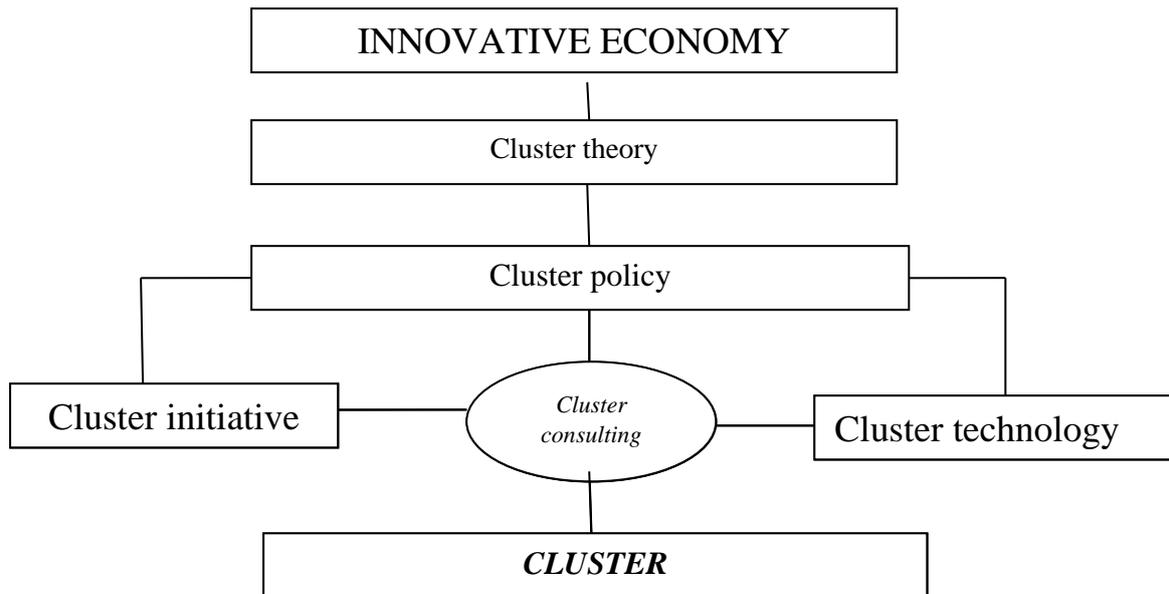

Figure 1: Implementation mechanism of cluster policy.

In our opinion, the cluster initiative, cluster firms, includes the strength of the joint venture, both aimed at promoting the development and competitiveness of cluster firms, government, education and research organizations in a definite spheres. If cluster policy is the mechanism of action of the state and cluster protection mechanism which promotes the competitiveness of the region and the cluster enterprises, as well as the application of innovations, then the cluster initiative is the organizing of a concrete cluster in a specific area. Cluster policy is revealed as an alternative to "field policy" which implements defence of specific enterprises and fields. Cluster policy substitutes the field policy focusing on a particular sector of the economy and the specific measures that are meant for this field, namely the technological designations (2). The main differences in the cluster approach compared to the traditional field approach are given in Table 1.

Table 1: Main different aspects of the cluster approach to management compared to the traditional field approach.

Main parameters for comparison	Cluster approach characteristics	Characteristics of the sectoral approach
Formation principle	Horizon and vertical integration, optimization of cross-sectoral interaction	Technological feature
Economic growth potential	Effect of synergy conditioned by the interaction of different elements. Presence of major participants (large enterprises, scientific institutions)	Production intensification
Opportunities for innovation potentials activation	High levels of innovative activity gained through concentration of resources in individual elements that identify the innovative potential of the cluster	Integrity of the innovation-driven system, the problems of communication
Competitiveness of products	Increase due to the concentration of cluster elements that lead to the reduction of transaction and transport expenditures	Weak territorial concentration of enterprises engaged in the reproduction within a single area
Investment attractiveness	Determined by the comprehensive use of investment resources	Investment effectiveness is determined by the capabilities of the investee.
Communication levels	Long-term relationships based on mutually beneficial relationships between cluster participants	Strong hierarchy structure determined by technological and administrative management relationships

Technology is a complex of organizational measures, operations and methods aimed at achieving optimal results by minimal means. Cluster technology is a cluster algorithm, taking into account the degree and scale of the existing market infrastructure's potential. As known, the application of technology is consistent with the completion of the cluster development strategy and action plan for the project, formulating the cluster participants' specific association, implementing the development program and evaluating its effectiveness (3). Thus, cluster technology requires a new, project-oriented approach to stimulate the cluster development and is regarded as a specific tool for cluster policy regardless of scale. The findings of MN Mironov's research show that in foreign practice, cluster politics is divided into two periods from the historical point of view as the first and second generations (4). The first-ever cluster policy includes a set of measures undertaken by the state to incorporate cluster identification, defining cluster firms' activities, and overall policies to encourage all clusters in the country. In this period, economists who have identified the necessity of clustering with economic geography and modeling play an important role. This stage of cluster policy is more characteristic for countries with a high level of development in traditional production (Spain, Portugal, Niderland and Italy). In the countries where the cluster exists, the second-generation cluster policy, based on high knowledge, implies individual approach to the development problem of each cluster. Thus, the public manager, customer, the initiator of the production process, acts as a source of financing for the cluster participants, who coordinates the producer and consumer within the cluster. The second-generation cluster policy is specific for countries that have clustered and high-quality economies (UK, Finland, Austria, USA, Sweden, Switzerland) in all sectors of the economy (industry, new technology and service sectors). The summarizing of the abovementioned allows to formulate the functions of the state in the clustering process and the principles of cluster policy. Thus, the summarizing of the aforementioned will allow formulating the cluster policy principles and defining the functions performed by the state in the process of clustering.

2.1. Main principles of cluster policy

Cluster policy is primarily based on the following principles:

- Systematics - The cluster and its constituent elements are subject to the economic system as a whole. Clustering envisages long-term planning of business-oriented projects;
- Selectivity - Prioritization of projects that contribute to the country's competitiveness at the national level. Provision of income outside raw materials, integration of production (finance) in science (s), synergy effectiveness;
- Reality - Taking into account global and regional factors, taking into account local characteristics, specific risks;
- adequacy to the cluster development phase - Implementation of regional pilot projects to achieve economic impact and minimize risks;
- cooperation between public and private sector to minimize risks;
- maximizing external effectiveness and sharing it among multiple stakeholders;
- Responsibility and control over the use of budget funds, transparency of key decisions;
- the state plays an important role, not dominant;
- multilevelity of clusters formation, national, regional and local.

In most developed or emerging economies, the state finances all-round cluster programs. In 2008, the "European Cluster Memorandum" was adopted, and all EU member states have nationalized clustering programs. The state interferes in the formation and development of clusters in two main directions:

- initiating the creation of clusters across the country;
- protecting existing clusters.

2.1.1. Functions and models of cluster policy

Depending on the purpose and culture of the enterprise, the state performs various clustering policies (5):

1. Institutional - Improving the quality of infrastructure and education standards that are considered as the basis of institutionalized crisis, elimination of administrative barriers, forming methodological and normative legal support for the process.
2. Mediation - Establishing and strengthening mutual relations between participants. Cluster projects to world markets. Ensuring access to technology. Information support and coordination of patent-licensing activities.
3. Cooperation - Development of cluster development strategies and tactics. Financing of projects, research and development works. Formation of the State Order Package to stimulate demand for innovative products.
4. Insurance - Creating appropriate insurance companies to share risk among cluster participants. Guarantee of the services to be provided and compliance with the commitments in the joint projects.
5. Stimulation - Motivation of potential and real cluster members with the help of budget-tax policy. Strengthening business activity in priority areas.
6. Control - Control over the use of budget funds in accordance with the project's goals and objectives.

In the cluster policy, the two different models of "cluster" and "continental" differentiate between different countries in the cluster policy. The first group includes countries such as the United States, the United Kingdom, and Australia, which defend the cluster policy of the "Anglo-Saxon". The basic principle of this policy is that the cluster is a part of the market relations system and, at the same time, removing all the obstacles that may arise in the development of clusters constitute one of the important functions of the federal government. A significant role in the formation and development of the cluster involves the regional authorities, as well as regional organizations that develop and implement cluster development programs together with key stakeholders. The federal government mainly sponsors and protects a small number of pilot projects. The "continental" model is used in a number of European countries (Japan, the Republic of Korea, Singapore, France, Finland, Germany, Norway, Sweden, etc.), where state policy plays an active role in the development of clusters. This model begins with the selection of clusters that are considered to be one of the priority and fundraising for cluster development strategies and programs, and incorporates a set of complexities ranging from formulating key elements (eg, infrastructure, research centers) to achieving achievement in their activities. In most developed or emerging economies, the state finances all-round cluster programs. In 2008, the "European Cluster Memorandum" was adopted, and all EU member states have nationalized clustering programs. The state interferes in the formation and development of clusters in two main directions:

- initiating the creation of clusters across the country;
- protecting existing clusters.

However, there is no single model associated with the economy's clustering. Therefore, the scale, type, forms and tools of the cluster policy are different, taking into consideration the country's national and regional characteristics (Table 2).

Table following on the next page

Table 2: Cluster policy classification

Types of cluster policies
1. According to the role of the state
1) <i>Catalytic</i> : brings together stakeholders with limited financial support
2) State investment is channeled to stimulate the development of <i>protective</i> - infrastructure
3) Through development of <i>directive-protective</i> clusters, special programs are realized aimed at transformation of regions or the relevant field
4) <i>Intervention</i> - is responsible for the specialization of the Directive and Clusters' perspective, for their specialization through transfers, subsidies, administrative restrictions or incentives
2. According to Genesis
1) <i>Up-down</i> : entrepreneur - central, local authorities, objects - national and transnational clusters. For example, Finland, Denmark, Netherlands
2) <i>Down-up</i> : "cluster initiative" - efforts to stimulate cluster development in the region.
3. According to the type
1) <i>High-tech</i> . Advantages: structural restructuring of the economy and strengthening of its competitiveness. Risks: (1) Most innovators in the world tend to select the same area of action. This increases the amount of investment attracted to similar technologies; 2) the absence of the initial conditions in the region, for example, the necessary resources, the habits for mastering new technologies; 3) fewer jobs
2) <i>Low technology</i> . Advantages: Creating numerous jobs within the cluster. Risks: Destruction of restructuring processes as a result of artificial defense of obsolete production technology, strengthening the country's outsider status.

M. Porter's pupil and follower M. Enrayt offers four mechanisms for the implementation of the cluster policy (6):

1. catalytic cluster policy: brings together government stakeholders (eg private companies and research firms) and provides limited financial support to them;
2. protective - in addition to the state's catalytic policy, large-scale investments in the development of infrastructure (education, professional training, marketing, etc.) that create favorable conditions for cluster development are taken into account;
3. directive - special programs aimed at transformation of regions or the relevant field by adding clusters to the defensive function of the state;
4. intervention - In addition to the directive, the government assumes responsibility for making decisions on the future development of clusters through transfers, subsidies, administrative restrictions or incentives, as well as an active control function that promotes cluster expertise.

3. CLUSTER CONSULTING AS ELEMENT OF CLUSTER POLICY

Cluster consulting is another element of the cluster system in implementing cluster policies and cluster initiatives. Cluster consulting involves providing information about services that are selected for clusters of specific types, as well as the basics of cluster management management. As a rule, cluster policies are implemented through cluster strategies that incorporate clusters organization and development, packages of specific actions on national or regional level. Cluster programs (identifies the names, duration and implementation of actions to be performed) that are identified, identified in the identified directions. In the implementation of cluster strategies and programs, typically, the use of variable, non-repetitive forms of analytical methods and techniques is preferred. Therefore, it is more appropriate to develop a new one instead of standardizing a set of measures that involves the formation and development of a specific cluster. This is a typical example of Finland's experience: Within the National Program, the "cluster structure" is defined and the regions are given the right to participate in the cluster identification, development strategies and tactics development. Regardless of the form of cluster policy, government intervention is implemented through the impact of key factors that determine the success or failure of clusters in neutralizing risks and overcoming the barriers. Different approaches are used during identification of these factors.

The most commonly-articulated form of this type of approach is the Diamond model offered by M. Porter. In this context, clusters' success factors are differentiated: 1) strategy and structure of firms, competition (institutional environment); 2) availability of relevant areas; 3) availability of required production factors; 4) requirements for world traditions and domestic demand. In these conditions, the main point for the Republic of Azerbaijan is an institutional environment that justifies the many risks. Regional, sectoral and corporate interests may not necessarily coincide with the interests of the country as well as the government's focus on business. Inadequate selection of priorities in the outcome of the official / business information asymmetry, lobbying the interests of business groups, compulsory arbitration of some projects, contrary to cluster desires. situations can lead to the creation of "false" clusters, the need for budgetary funds, and the conservation of the existing structure of the economy. In order to avoid this, first of all costs for using non-innovative tools should be increased, the transparency of decisions taken and their social expertise should be increased, focusing not on individual beneficiaries but on clusters as a whole; control over the implementation of the obligations by the cluster participants should be monitored, gradual transition to cluster policy should be ensured through pilot projects.

4. CONCLUSION

The concept of "cluster politics" in countries around the world is at the stage of adaptation to the specific activities of the government, economy, science and education, business and society. Cluster policy is generally considered a new direction in the development of relevant economic sectors and sectors across the country. Research in this area forms the initial conditions for the use of the cluster form from its innovative potential to practical activities. Clusters like the national development bloc are targeted at modernizing the economy through large-scale analytical and regulatory-methodological work. During the implementation of cluster programs, three important factors, such as the selection of the participants, the organization of the services provided, and the participation in the funding of research / project financing are highlighted. Evaluation of these factors is at the stage of creating clusters. The direction and volume of state protection directly depends on the specificity of the clusters created.

ABSTRACT

The most important EU member states may shift away from the US renewed containment strategy, oriented on Russia. NATO allies had in earlier periods picked up geopolitical theories and theses from Mackinder and Spykman. More recently, these were used by political lobbies in the US administrations inside the White House and Pentagon to create the US Grand Strategy that was devoted to building up the US hegemony into the world by following the New World Order in the 21st century. The Containment policy toward Russia was created by the US financial, economic and military lobbies, to continue with the old fashioned Geopolitics. The EU member states may find out common military identity and authority to form a European Defence Union (EDU). The EU could open a new page into the (white) book to implement multilateral world order that shares geopolitical and geoeconomic interest in defence cooperation with China and Russia, and therefore continue with the development of its defence identity, more independent of NATO.

Keywords: *The European Union (the EU), PESCO, defence cooperation, NATO, the USA, Russia, the PR China*

1. INTRODUCTION

European politics made a major shift in the 21st century away from conflict theories to successfully avoid continental wars and especially twisted downturn to distance itself from the warmongering toward military confrontations. At the beginning, we have to mention geopolitical theorists whose theories were deeply involved into forging international policies in the 20th century. Geopolitical theories and theses of Mackinder and Spykman were used by political lobbies in the US administrations inside the White House and Pentagon to create the Grand Strategy devoted to building up the absolute hegemony into the world by following the New World Order in the 21st century. NATO is the most powerful means of implementing the US interests in Europe. The Containment policy was created by the US financial, economic and military lobbies. Is Europe still under the influence of confrontation theories? Is this the reason why it is not pushing deeper multilateral (defence) cooperation in Eurasia?

2. THE CURRENT EU DEFENCE COOPERATION AND THE ROLE OF NATO

The US officials at the 2018 Munich Security Conference expressed their fear that the EU defence cooperation may distract the EU from NATO (Karnitschnig, 2018).

The Pentagon official criticized the EU's common security and defence policy for pulling forces away from NATO, and the U.S. ambassador to the Alliance warned against the provisions to protect European defence companies (Valášek, 2018). The EU states need to spend more money at defence budgets to prepare for war against Russian counterpart. That was a clear voice from US partners in NATO alliance to EU partners. The US President Trump singled out that the USA stood by the clause, which states that an attack on one NATO member is considered an attack on all of them. But his remarks in Warsaw since 2017 were the first time he had done so on European soil (Crowley, 2017). Trump had labelled NATO as obsolete and openly questioned whether the USA would make good on the treaty's communal defence obligations for nations who have not spent enough on their own militaries. As President, he has railed against NATO members who do not meet the agreed-upon two percent of their gross domestic product (GDP) on defence and has claimed credit for increasing military spending among member states (Nelson, 2017). He had asserted and repeated again that NATO alliance being out of date to be pensioned soon. The US Secretary of Defence Mattis had wowed to European allies by telling them they must increase military spending or the USA will pull back from its commitment to the transatlantic bloc. No longer can the American taxpayer carry a disproportionate share of the defence of Western values (Herszenhorn, 2017). It is a warning to the European pillar of NATO states to buy more military product made in US to increase profit to US multinationals into the productive defence sector complex. The EU states spend €27 thousand per soldier on equipment and research, compared to €108 thousand per soldier by the USA. And while Russia spends more than five percent of its annual GDP on defence, the EU member states spend an average of 1.3 percent of GDP (Herszenhorn, 2017). The EU stays behind the US military spending, it seen that the EU leaves from mercy like a big social problem, taking social allowance and some adoptions of NATO fund. The systemic nature, dynamism, and sustainability of the Eurasian continent, depend on the degree to which Heartland is orderly and manageable. The main function of Heartland –the central part of Eurasia – can be described as ensuring sustainable land contacts along the parallels (West-East) and meridians (North-South). In other words, the central part Eurasia should contribute to consistent geopolitical and economic integration of large and relatively isolated areas of the Eurasian continent (Ismailov and Papava, 2010: 97). The neo-geopolitical approach in the early 21st century gave a new boost to studies of the regional structuralization principles for the geopolitical and geo-economic space of the entire Eurasian continent. NATO policy has tried to fulfil its principles and expectations since the end of the Cold War, by pushing the NATO Alliance into eastern states and Balkans those was under Russian dominance before. After the Warsaw pact had collapsed and this vacuum had been fulfilled by expansion policy under NATO alliance that had set political control over the post-communist Central and Southeast European states. The NATO alliance system hinges geographically on the Western portion of the landmass and constituted the western flank of the US Containment policy. In the south lay the Middle East and the southern portion of Central Asia (as for the Gulf, for some time Iran was a pro-US ally under the Shah until the Islamic Revolution in 1979), and to the East lays Japan as well as other countries in the US camp as well as naval bases, all positioned to prevent any power in Pivot from dominating the Eurasian landmass through the Rimland. The main goal of this strategy was to prevent Heartland (or Pivot) from being dominated by a single power or coalition of powers (Boon von Ochssée, 2007). The USA is opposed to the EU's integration into super state and formed multinational European army under single command as single set of forces to carry out the European defence policy. The USA does not support European defence union that could endanger NATO existence in Europe and renounce defence relation with Russia. Both Mackinder and Spykman had been applauded on the conflict relations in history by confrontation sea power against Heartland. In Spykman, however, there are conflicted international relations between sea powers and Heartland, and that between an

independent centre of power in the Rimland with both sea power and Heartland allied against it (the EU super state against the domination from the USA, Russia, and China). The US approach to containing Russia's strategy is being a part of the New World Energy Order which is based on geo-strategic thinking by Mackinder. The old fashioned political theory was transferred into modern international relations with some corrections those are coerced through alliances NATO, CENTO, and SEATO did into the Containment policy, by tightening economic, military and political siege around Russia and China.

3. THE ENTENTE OF HEARTLAND ON ITS WAY TOWARDS DEEPENING DEFENCE COOPERATION?

Russia and Germany watch carefully Beijing's One Belt, One Road project (OBOR), that was announced in 2013. The possible tripartite world of Europe-China-Russia poses a huge challenge to US foreign and trade policy. The road ahead for the Trump Administration is full of possible jarring potholes, which would be familiar to all three geopolitical theorists – Mackinder, Mahan and Spykman (Norval Morgan, 2017). Germany, Russia and China had conversed common joint strategy to connect, cooperate and consolidate (3C approach) Heartland. The common project was aimed to build up intercontinental Economic Belt made up by those countries those are encompassing communications by traffic railroads through Central Asia, West Asia and Europe. The USA might stop or disrupt this major continental traffic connection by flaring up interstate wars into those states served as getaway or pass way states inter positioned in the Caucasus (Georgia, Azerbaijan, and Armenia etc.) and the Eastern part of Europe (Ukraine and Moldavia). It is looking for interconnection at land and air with Russia and China with Silk Road switches otherwise they are searching for designated path on the roadmap how to avoid physical territory of NATO centric states in Europe. NATO centric states into the Eastern Europe had emplaced barrier like indirectly frontier states to Russian neighbourhood states with Belorussia and Ukraine after NATO enlargement was pushed toward Eastern flank. Other EU smaller post-socialist states Slovenia, Croatia, Czech, Slovakia, Hungary and Bulgaria still balance in which political club they belong. Heartland players had been boosting mutual defence cooperation into defence industry since 2018, while Russia is enlarging its defence industry collaboration with Germany and other European countries in Eastern Europe's Balkans region, despite the US threats to impose additional anti-Russian sanctions (Sputnik News, 2018). Neoliberal context by building up mutual EU – Russian cooperation and trusties may shake legs to NATO hostile policy if the EU states are going to lift sanction against Russia. The US will continue with attempts to derail EU – Russian cooperation. Political fissures had been cracking totally between Old and New Europe states disagreement among lifting siege for Russia and renouncing back diplomatic, economic and military ties before Ukraine fiasco. If the EU states will not replace political attitude to transatlantic link while the EU common defence and security policy is not willing to replace or compete with NATO as the EU is not a military alliance and will not turn into a military alliance (Aries, 2017), then the EU Grand strategy issued since 2014 presented only a "paper tiger" for the EU defence cooperation. Referring on the defence cooperation in a transatlantic context did not exist absolutely. Juncker said, if Europe does not take care of its own security, nobody else will do it for us (Barigazzi and Cooper, 2017). Increased support for partnership was expected from France, Germany, Italy, and Spain. The EU is the world's second-biggest spender on defence, because many EU countries traditionally favour domestic munitions manufacturers, about 80 percent of defence procurement in the EU is carried out on a national basis, which has in turn created a highly fragmented defence market across Europe. European armies use 17 different systems of battle tanks, compared to just a single system in the US army. While the US army operates with just two different types of howitzers, European soldiers use 27 different systems.

At sea, the European naval forces work with 29 different types of destroyers and frigates, compared to four in the US army. A total of 178 different weapons systems are in use in Europe, compared to 30 in the US army (Delcker, 2017). The duplication of defence trading is evident and EU states are focused to preserve national defence productions of facilities. The PESCO initiative under would reduce production costs by pruning armament national programmes to get avoid from flooding European defence market without hi-tech technology assortments. The EU leaders agreed to increase spending on defence research from €25 million now to €500 million beginning in 2021, which would make the EU, as integration, the fourth largest investor in Europe in defence industry research after the UK, France and Germany. The investment program needs approval by both the European Parliament and national capitals (Copper, 2017). If national governments did not pay for procurement and development programmes because defence budgets get short of money, defence companies will produce nothing. International cooperation is possible to joint Russian and Chinese defence producers to invest more money into defence research and infrastructure to produce hic tech technology products and wreck trade barriers for selling arms inside Eurasian defence market. Here, absolutely economic deficit would be minimised to turn up the dynamic curve to expand it. Some minds in Moscow understand that the eventual collapse of the EU (of which it is so fashionable now to speculate among the Russian ‘pundits’) would be something like ‘the greatest geopolitical disaster of the 21st century’ and could prompt greater unpredictability in the entire region (Mizin, 2017). After the US intervention from NATO alliance on the EU – NATO states those Heartland relations had been soured. Moscow and Brussels might be willing to formulate and promote a new pattern of interaction without NATO policy and bypass the US pressure without transatlantic sanction to those EU – NATO states by lifting sanction against Russia while they agreed to reconnect historically, economically and politically traditional relations bilaterally again. Officially, Moscow is pleading for reviving cooperation between the EU and Russia, because loose and loose strategy could benefit only to US side. But who is here the looser und who had benefit from collusion with Russia? The situation is still somewhat complicated in 2018, since these European producers that had cooperated with Russian companies into defence sector before sanctions were put into effect, sought to bypass economic sanctions as to hide the facts of traditional cooperation, now some of them are openly violating it behind the back of economic regime. It was applied on the EU states: France, Italy, Austria and Hungary, Bulgaria, and Greece to further cooperate with Russian defence sector into automotive and aviation industry. The US side vowed with harder pressures with more sanctions against this military cooperation whose are continuing to grow but Russia and EU states are much more interested in cooperating together.

4. THE EUROPEAN UNION – RUSSIA DEFENCE COOPERATION

France and Germany reclaimed for more strategic autonomy of the EU into defence policy while German calls more for a European Defence Union (EDU) within European army, like finished integration process but France insisted more on stronger intergovernmental EU defence policy. France wants a symbolic integration process because it wants to preserve good transatlantic relationship whilst the US does not want a strong Europe. Poland follows NATO’s policy while defending NATO territory in Eastern Europe and gets involved in possible military intervention in Ukraine against Russia. Poland’s worries were about Ukraine and the military threat of Russia, and panicking among critical scenarios like annexation of Crimea, subsequent war fighting and military supply to Donbas’s Militia into the Eastern Ukraine. Worries have increased when Russia had deployed ballistic missiles to Kaliningrad military region and carried out joint Russia–Belarus military exercise in 2017, near the border with Poland and Lithuania. Italy was refocused toward the Euro – Mediterranean region to fight against migration gangsters from North Africa and Middle East those are smuggling refugees over the

Mediterranean Sea into Europe by using Italy like transit state in Europe (Keohane, 2018). If we compared this reports of some states, we would find out that the EU states have deep problems as we thought to identify itself into national defence policy. The crisis into national defence policy braked down reintegration process on two different tracks; the first track contributed to disconnect defence integration like to be more interrelated toward European defence union while second track was absolutely disconnected to deeply converse Russian defence policy toward Eurasian defence zone. This policy had failed since 2014, whilst the EU – Russian bilateral relationship was disrupted from economic sanctions against Russian under the US coercive policy in Europe. Economic sanctions did not interrupt commercialization of goods into defence sector from the EU defence companies to bargain with Russian defence firms, only costs had been arisen. Foreign Minister Gabriel condemned national selfishness and declared: “The motto ‘our country first’ only leads to more national confrontations and less prosperity” (Kirchick, 2017). Germany strongly opposed to Trump withdrawal from Western-influenced multilateralism that forget the US sentiment to neglect common values under NATO alliance. Juncker asserted without hesitation in publicity that the EU could not continue to rely on the USA for its defence and cannot turn to US for its future protection (Scott, 2017). Several countries have expressed doubts on the usefulness of sanctions, including Hungary, Italy, Bulgaria, Czech Republic, and Slovakia; one EU official described the EU consensus on this issue as “not going without difficulty.” (Pezard et al., 2017: 59). At most the EU member states asserted a big doubt among effectiveness of economic sanctions and it is only a matter of time when those sanctions will be lifted in one voice of EU council. European states with BRICS economic block may resist against the US dollar diplomacy and keep going to move away from their traditional servility to Washington as been able to stop US blackmailing other states by violating interstate sovereignty. Europe’s capitals were confronted with Washington among imposing customs on steel and car industry from Europe, and economic struggle would deteriorate situation in the transatlantic relations. Geopolitical brake down from the EU towards the USA was no longer so remote to postpone misunderstandings. Here is opening new path, Moscow and Beijing are planning to incorporate Europe into their mega Eurasian project as the fourth major component after Asia, the Eurasian Union and the Middle East/Persian Gulf. If Moscow – Beijing economic tandem could rejoin EU into geo economic block to rebuild Eurasian defence sector than US will be excluded from the game.

5. THE EUROPEAN UNION – PR CHINA DEFENCE COOPERATION

The PR China had opened wide door to European military technology to invade into PR China’s defence sector since the economic embargo was lifted to transfer advanced military technology. Financial dynamic invested into PR China’s defence sector had completely changed situation over the past five years into military modernization process of the PR China’s army. Chinese President Xi Jinping has put an end to the practice of making any progress on international security cooperation with Europe conditional on the lifting of the embargo. This is the result of the PR China’s arms industry’s progress (Duchatel, 2018). The PR China had access to critical technologies that had speed up modernization process for ten years, and beside it had created main conditions for advanced innovation and leadership for the next generations of arms toward C4I updated technology. The PR China had paid off for some advanced hi-tech licensed equipment – those are being incorporated into Chinese military helicopters, ships and submarines, and were needed to speed up modernization process of China army but it seems that the EU thoughts ongoing into direction to prevent all transfers of dual-use technology to the PR China as to protect Europe’s critical technology. Chinas economic intensions became doubtful about financial influence to invest more money by spending into common hi tech military projects together with Europe champions into defence sector as the PR China tries to increase pressure by lifting economic barriers to arms transfers and export controls.

The main barrier to deepening of the EU-PR China defence cooperation is the will of NATO allies and especially of the US to preserve sensitive hi-tech military technology, whilst the PR China is still accused for industrial espionage and stealing military patents. Arms control measures among transferring hi – tech military technology to third states could not be secured by NATO protocol of regime export mil technology or under the PESCO projects carried out by the EDA control. The PR China may use hi-tech military projects to benefit itself to modernize own army into all military branches by following up European modernization process under Horizon 2020 projects. The defence companies from the EU shall take decision, if cooperate or not cooperate into the joint EU-PR China defence cooperation. The PR China had pleased the EU member states to fully participate into the Eurasian megaproject and invest more money to rebuild the Silk Road strategy toward the western part of Heartland. This invitation was referred on the defence cooperation too if EU states did not decide for protectionism. It was likely seen that the EU had been stuck between US and PR China's economic influence from foreign geoeconomic investments. The PR China, meanwhile, "is leveraging military modernization, influence operations, and predatory economics to coerce neighbouring countries to re-order the Indo-Pacific region to their advantage," the Strategy declares. And the Chinese military modernization program, it adds, is designed to achieve "regional hegemony in the near-term and displacement of the USA to achieve global pre-eminence in the future" (Morgan, 2018). "The EU and China signed a 'strategic partnership' in 2003, and adopted 2020 strategic agenda for cooperation in 2013. These agreements resulted from a mutual commitment to cooperation and signal an interest to further advance ties" (Dorussen, 2017: 2). Prominent role from EU states those had invested more money into defence sector into foreign business had cemented economic benefit in the PR China defence sector for some EU defence firms, to expand the global market for selling military goods out of the EU market, that became more relevant on global market inside the EU-PR China defence relation. Solidarity and unity were cracked down into one voice while decision making process inside European NATO pillar had been divided into two political blocks. Atlantic hub encountered against European hub for more centrists reproach toward federalization process to form the EU super state. Political dwindling, dividing and disunity (3D) had brought NATO alliance to crack solidarity and unity apart between Europe and the USA, only media black coverage had been disseminating lies into publicity that was everything fine within the EU-US bilateral cooperation under the NATO alliance but this was false flags signal to sweep rubbish under the political carpet. Those political, economic and defence cooperation for 3D reasons had worsened fragility under the NATO alliance. Otherwise, an alternative was opened as China signalled to EU states as to re-join Silk Road strategy on continent. China is willing to invest more money into EU critical infrastructure to reconnect roads and rails guided from Peking to Europe by transiting Russian territory. Why is the EU important for PR China's geoeconomic interests? Truly answer singles out: the PR China wants Europe to counterbalance American power while Europe is a softer partner than the US. The EU is weak, politically divided and militarily non-influential (Hanso, 2017: 125). China plays on the weakest point into the EU fragility while it knows well how to approach with multilateral diplomatic step as Beijing treats the relationship like a game of chess with 27 opponents crowding the other side of the chess board.

6. CONCLUSION

The new relationship between Russia and China is clearly a matter of that will last. If the EU fails to build up an entente inside international relationship to oust US deadly containment strategy against Russia-PR China alliance, than we may predict that Russia and the PR China could potentially form a new defence alliance, the equivalent of a Eurasian NATO that would be a threat to both the EU-US as productive counter balance against the US renewed

containment policy in Europe. The next potential regional superpower which was based on Mackinder's map was China that presented an important constituent part of the world power above the EU, India, and Russia. China's influence had been raised rapidly towards other parts of Heartland with rising economic trend while it had invested more money to interconnect entire Heartland continent via East – West axis. It needs to rebuild the largest economy inside the Asia- Europe vital economic zone to eventually surpass the USA and introduce the petro yuan world currency to emplace the global superpower status. If the EU security concept becomes inappropriate for Russian and Chinese ambitions than both may integrate their plans for a new Silk Road and the Eurasian Union not only grows up economically but gets to activate politically and military, to encounter toward NATO alliance in Europe. If the Eurasian Union is going to be expanded forward to make stronger Russia-China geopolitical axis in Central Asia and Caucasus, then it would be more difficult to restore EU-Russia bilateral ties, by implementing the EU Global strategy.

INTEGRATION OF AZERBAIJAN FINANCIAL MARKET INTO INTERNATIONAL FINANCIAL MARKETS

Kenish Garayev

Azerbaijan State University of Economics (UNEC), Azerbaijan
Kanish.garayev@unec.edu.az

ABSTRACT

Globalization has increased the capital mobility in the world. Increasing opportunities for investors to maximize portfolio returns is one of the greatest benefits of globalization. Financial liberalization has also provided investors with opportunities to diversify their risks. Parallel to this, integration in terms of an effective portfolio management has taken its place among the most discussed topics in the finance literature. Integration efforts in the world financial markets change financial instruments and institutions at increasing speed. Within the framework of this change, foreign investors are investing in many countries' financial instruments in order to diversify their portfolio, resulting in similar trends in price movements. These increase trends in capital mobility provide several advantages, but also some disadvantages. The Azerbaijani financial market, which is in the development phase, has become a share of this investment after 2000s. These rapid developments in international financial markets also affected the Azerbaijan financial market and entered into a process of integration with world markets. Despite its disadvantages to banking and other financial institutions the economy of Azerbaijan, which is in the process of development, provides various benefits from this integration process and significant improvements in the growth rate. This study is a research on how integrated countries similar to Azerbaijan and Azerbaijan's countries with high foreign trade rates are integrated into world markets. As a result of the research, it was observed that the integration of the financial markets of the countries that similar characteristics in terms of development with Azerbaijan was in an increasing trend.

Keywords: *Correlation, Economic growth, Financial integration, Financial markets, Globalization*

1. INTRODUCTION

Financial markets that provide fund exchange by bringing together the fund suppliers and fund seekers provide benefits to the national economies by increasing national income, spreading savings and ownership to the base, establishing a risk-return balance and increasing the scale of firms. Integrated markets offer both investors and fund-seekers opportunities in terms of securities diversification, cost reduction, risk and return. The purpose of investors to invest in international markets is to take advantage of portfolio diversification, reduce the total risk of their portfolios to keep them at a rational level and to achieve maximum return at minimum risk level. The aim of this study is to investigate the benefits of the international financial integration of the Azerbaijani financial markets and to help them minimize the risks and maximize their returns by providing the investors with information about their international portfolio diversification.

2. FINANCIAL SYSTEM

The financial system consists of the markets where the fund surpluses come together with those who have a fund deficit for the investment they will make. In general, the basic elements of the financial system; fund providers, fund seekers, financial institutions, financial instruments and legal-institutional arrangements. Within this system, the owners of the system make money available to those who demand funds by means of various means and intermediaries and in the

confidence environment provided by legal institutional arrangements. (Afshar, 2007; referenced by Charles 1987, p.188).

2.1. Azerbaijan Finance System

Until 1991, when the Soviet Union became a part of its independence from the 1920s, Azerbaijan's economy had always been more advanced than the Armenian and Georgian economies. After regaining its independence, a long period of transition from the control economy to the market economy has been linked, and within the framework of the reforms, the country's financial system has entered a structured process similar to that of the developed countries. (Güven, 2012; p, 103)

2.1.1. Baku Stock Exchange

Establishment of stock exchanges in Azerbaijan began with the creation of state debt instruments in 1996. In the same year, the Ministry of Finance announced the withdrawal of the first treasury bonds with an interest rate of 5 million manat (about one million dollars) and an annual interest rate of 31.8%. In 1999, the State Committee for Securities began to create basic mechanisms for the development of the securities market (Mammadov, 2013; p, 16). It is difficult to attract institutional investors to the stock since the number of individual investors and the number of registered traders in the Baku stock exchange are very small and many capital transactions outside the stock market. Currently, the main currencies, which are traded on the stock exchange, are USD Dollars, Euros and Russian rubles. However, 98% of the market is USD dollar. (Ataşov, 2016; p, 36)

3. FINANCIAL INTEGRATION

Financial integration is a topic of concern for all countries in the contemporary economics and finance literature. After the liberalization of the local markets, the financial integration process accelerated with the development of the Euro-markets since 1960. Financial integration is associated with the economic development of the era after the Second World War. Conceptual discussions are taking place in the literature. There are definitely different definitions. The broadest definition of financial integration was issued by the European Central Bank (ECB); "The application of equal rules for the purchase and sale of financial instruments, equal access to financial services and products, and the same attitude to the participants of the financial markets" (Özbek, 2004; p, 143.). Integration of local financial markets is possible in three ways:

- It is possible for citizens to borrow from foreign markets and to invest in foreign markets at local markets.
- Citizens' ability to invest in foreign markets, and the ability of foreigners to borrow from local markets.
- It is possible for local residents to establish debt and investment relationships in foreign currency, for example, to open accounts with local currencies in foreign banks and receive loans in foreign currency. (Kreiken, 2017; p, 7.)

3.1. Benefits of Financial Integration

Financial integration creates two useful opportunities for developing investments and diversifying risk. Here are some of the benefits of financial integration:

3.1.1. Increasing the Opportunities for Borrowing from International Markets and Risk Diversification

One of the most significant gains in financial integration is the ability to borrow from international markets and take advantage of opportunities to diversify risks through increased foreign exchange rates after the increase in financial liberalization.

Together with private investors, domestic banks can lend both to foreign markets and lend their debt to the markets, which leads to increased effectiveness. (Stavarek, 2014;p, 6)

3.1.2. The Impact of Economic Growth, Investments and Consumption Quantity

Financial liberalization, which has the ability to regulate international resources, boosts local investment and economic growth. The growth of financial integration rates of many developed and emerging economies has resulted in increased borrowing from international markets, increased local investment and savings. The growth of investments, in turn, has had a positive impact on economic growth. In general, the increase in investment and savings across the country leads to the growth of the economy and the growth of living standards (Stavarek, 2014;p, 7).

3.1.3. Increasing the Effectiveness of the Banking System and Financial Stability

Together with financial liberalization, foreign banks' access to local markets, along with increasing the depth of financial markets, also significantly reduces operating costs. The studies made so far show that foreign banks' access to local markets has led to a rise in service quality, increased competition among banks, and a substantial decrease in their profits (Stavarek, 2014;p, 7).

3.2. Financial Integration Risks

Research done in the last quarter of the century shows that, with the benefits of fiscal integration, there is a cost that can not be ignored. As is known, capital mobility is not equally distributed to all countries. In this case, the capital flows that intensively enter into some countries, and some countries have a financially open economy, but they are not. There are some risks of financial integration in view of these statements (Yang, 2012; p, 12).

3.2.1. Non-Equity Sharing of Capital Flows

When it comes to capital flows, it is seen that not all investments are equally accessible to financial institutions. Thus, achieving the desired outcomes through financial integration is strengthened. As a result, low-income countries are less likely to share capital investment. Failure to borrow from foreign markets during economic stagnation minimizes the benefits that countries want to gain from financial integration (Yang, 2012; p, 12).

3.2.2. Non-Equitable Distribution of Increased Capital Flow in the Country

In addition to the importance and benefits of capital gains in the country, the use of these investment inputs for low-end investments later in the year creates problems and minimizes the positive effects of increased investment movements on economic growth. If the capital flows are not integrated into the right places, the country's economic growth figures may adversely affect the country's macroeconomic stability (Yang, 2012; p, 13).

3.2.3. Exposure to Macroeconomic Stability

Capital flows can sometimes cause unwanted adverse effects on the economy. The rapid growth of investment in countries is reflected in the increase in the amount of money available in the markets and the impact of this on high inflation. At the same time, the negative balance in the floating exchange rate economies is rising and this leads to the loss of local currency (Yang, 2012; p, 12).

4. INTEGRATION OF AZERBAIJAN FINANCIAL MARKET INTO INTERNATIONAL FINANCIAL MARKETS

Significant progress has been made in the last 20 years both in terms of both developed and emerging economies. In particular, the integration of European Union countries has significantly increased. Diversification in international stock markets has allowed the portfolio investor to significantly reduce the risk of diversification in local markets. Because, at this time, the investor will gain income the lowest level of risk. In line with the purpose of this study, we tried to obtain the closing prices of the shares of the companies listed on the Baku Stock Exchange to determine the relations of the Azerbaijani financial market with both the EU countries and the world countries. However, due to the late creation of stock markets and the development of the financial market in the country, these figures were not achieved. For this reason, the figures of developing countries such as Azerbaijan were used to study the relationship between the Azerbaijani financial market and world markets.

4.1. Data and Method

During the study, the data used dependent and freely varying are stock indexes with dollar closing traded prices. Monthly closing figures for the years 2010-2017 have been used as the data interval. The information is available at www.investing.com. The data covers 8 countries (USA, England, Germany, France and Japan) as well as developing countries (China, India and Turkey). When countries are concerned, the countries that high trade balance with Azerbaijan are pre-eminent, especially in countries with high trade balance in the oil sector. Despite the high turnover with Italy at the time of overseas trade balance, this country was not included in the analysis as it was not possible to obtain monthly closing prices for the period covered by the survey. S & P500 for USA, NIKKEI 225 for UK, UK FTSE 100 for UK, CAC 40 for France, DAX GERMANY for Germany, SP BSE SENSEX for India, HANG SENG for China and BIST100 for Turkey was used. The closing prices for these 8 indices are 96 months. Correlation coefficient method was used as the method of analysis in the study. With this method, monthly earnings per share were calculated and correlation coefficients were obtained with the help of these revenues. Correlation coefficients are calculated using Ewiev8 program. The correlation coefficient is used to determine the degree of correlation between the two variables. Although these coefficients can determine the extent to which the changes between two variables are appropriate, it is in no way a cause-and-effect relationship. Correlation coefficients range from -1 to +1. The coefficients of the strength of these coefficients are as follows:

- 0.00-0.25 - Very weak contact
- 0.26-0.49 - Poor connection
- 0.50-0.69 - Medium connection
- 0.70-0.89 - High contact
- 0.90-1.00 - Very fast contact

The study included data on the analysis period and eight countries with foreign trade turnover with Azerbaijan. These 8 countries represent developing countries as well as developed countries according to their level of development.

5. CONCLUSION

In general, the monthly closing figures of the 8 countries included in the study are similar apart from Turkey and India. However, by looking at the monthly closing prices of these indices, it is not possible to determine which market is affected by the market. Correlation coefficients were determined to determine the relationship between these indices included in the study. The correlation coefficients between these indices are as shown in the following table.

Table 1: Correlation Matrix

	France	India	Germany	England	China	Japan	USA	Turkey
Turkey	0.00	-0.02	0.04	-0.01	0.02	0.01	-0.03	1.00
USA	0.87	-0.03	0.79	-0.01	-0.02	0.00	1.00	-0.03
France	1.00	0.01	0.74	0.01	0.03	-0.14	0.87	0.00
India	0.01	1.00	0.03	-0.01	0.01	0.01	-0.01	-0.02
Japan	-0.14	0.01	-0.04	-0.02	-0.18	1.00	0.00	0.01
Germany	0.74	0.03	1.00	0.01	0.01	-0.04	0.79	0.04
England	0.01	-0.01	0.01	1.00	-0.01	-0.02	-0.01	-0.01
China	0.03	0.01	0.01	-0.01	1.00	-0.18	-0.02	0.02

The moderate correlation coefficient for investors is more desirable than the high level. Because low-grade correlation coincides with those that have not yet integrated. The correlation coefficient indicates a strong and highly positive relationship, which means that inter-market integration is relatively high. As can be seen from the correlation matrix in the table above, can not be mentioned about a strong relationship apart from US, France and Germany. According to the table, the highest correlation coefficient is in the United States and France, the world's largest stock market. Other highest coefficients were recorded between the US and Germany, Germany and France. The main reason for these high correlation coefficients is that they enter the same unit as the European Union and have high commercial relations with the US, similarity of production and consumption favors, high income levels, and other economic events. However, it is not possible to say which countries' financial markets are affected by the correlation rates. That is, it is impossible to identify the affected country and the affected country by the correlation matrix. In this case, the United States is acting in the same way as the indices of both countries and this does not allow investors to diversify their portfolios. When we look at the table, the lowest correlation rate is calculated 0.01 (France and India, Turkey and Japan, France and England). Other low coefficients 0.02 (Turkey and China) and 0.03 (Germany and India) were calculated. When it comes to attention, lower coefficient rates are more common between India and Turkey and other countries. The main reason for this is that India and Turkey are developing countries, low income levels, differences in industry structure and so on. Looking at the table, some correlation coefficients are seen as negative. For example, Turkey and the United States, Japan and France. The negative coefficients are a sign that relations between countries are inversely oriented. For example, any crisis in Turkey has nothing to do with the US economy. In this case US markets have become more attractive for investors. In general, the relations between developing countries and developed countries are positive, but they are poorly correlated. This is a good solution for investors. In this case, portfolio managers will be able to minimize their risk by diversifying the risk of portfolio stocks by seeing that a country's economic stagnation does not affect other countries. As a result, the increase in correlation coefficients between financial markets reduces the benefits of diversification. The main reason for this increase can be the lack of incentives, mobility, free trade, and a global structure of companies. Taking all this into account, investors are better off developing countries than in developed countries, where correlation coefficients are lower. Lower correlation rates can lead to a reduction in the total risks of the portfolio. This will mean getting more income for the investee. Because markets that have low correlation rates can neither grow nor enter the crisis period.

When international financial integration is assessed for Azerbaijan, the development of the financial markets and its integration with the international markets creates conditions for risk sharing, along with allowing domestic investors to evaluate their portfolios in foreign markets. At the same time, with the help of financial integration, the country becomes an attractive country for foreign investors. Together with this, the national income figures per capita will increase in the country, and the standard of living will increase.

HUMAN CAPITAL DEVELOPMENT & ECONOMIC GROWTH: AN EMPIRICAL STUDY ON JORDAN

Muslum Ibrahimov

*Head of Department "Economics"
Azerbaijan State University of Economics (UNEC)
m.ibrahimzade@gmail.com*

Mustafa Mohammad Alalawneh

*Ph.D student in Khazar University
falconengineer81@yahoo.com*

ABSTRACT

This study examines the effect of human capital on the average productivity of workers in Jordan employing the ordinary least squares (OLS) method to the data ranging from 1980 to 2014. The results showed that there is a positive and statistically significant effect of human capital development (HDI) on the average productivity of Jordanian worker (RAPL). The study concluded with a number of recommendations, the most important of which is that this study is the introduction to many more detailed future studies and aims at the relationship between the human development index and its components education, health and income. The study also recommends that more efforts be made to address health, education and cognitive skills and to improve the level of income distribution in order to increase human productivity.

Keywords: *Human Capital Development, Average Productivity, Economic Growth, Human Development Index, Jordan*

1. INTRODUCTION

Economists have long emphasized the importance of human capital development in achieving economic growth. In his famous book "The Wealth of Nations", Adam Smith states that all the acquired and beneficial capacities of other members of society are a cornerstone of the concept of fixed capital, The ability to acquire learning abilities is accompanied by financial costs, yet these talents are an important part of the individual's wealth, which in turn is a major part of the wealth of the society to which he belongs. Alfred Marshall A. Marshall emphasized the importance of investing in human capital as a national investment, and considered that the highest types of capital are the capital that invests in man, as the backbone of human development in its different dimensions (Todaro& Smith, 2015). By means of man, nations advance, and the economy itself is of limited value if it is not exploited for the sake of progress, by the human forces that transfer wealth from mere quantities to various technological energies to achieve the desired progress. Investment in human capital is at the forefront of the issues addressed by societies in different systems and levels of growth. It has proved that the human element is no longer only a component of production and determinants of productivity. It is the main factor in all components of human development. The importance of human development as human investment is the best form of investment because it is the firm and sound foundation for building a healthy and socially and economically viable society. Jordan realized early on that investing in human development is a long-term strategic investment that can drive the overall development. The main pillar of the national achievement equation is the qualified and trained human being. Jordan is suffering from a clear shortage of natural resources, but it has a human resource capable of achieving the desired development to compensate for the scarcity of natural resources. Thus, both education and health in Jordan received great attention from the government to promote economic and social development in the Kingdom, which has improved the reputation of education and health services during the past two decades, and

increased demand for Jordanian human resources abroad, especially in the Gulf States. Human development includes improving human conditions through health, education and income, and human development considers economic development a necessary and not sufficient condition. Jordan is considered a unique situation in the Middle East in terms of economic and political crises, as well as the characteristics of Jordanian society, which pose a significant challenge to achieve the desired balance between resources and human beings and thus in the light of the scarcity of natural resources in Jordan and not to exploit them optimally, Jordan is a human resource capable of producing the desired development to compensate for this to restore balance. This study attempts to answer a question. What is the relationship between human capital development and Average worker productivity? This study aims to investigate the impact of human capital development on Average worker productivity in Jordan during the period 1980-2014, and test the hypothesis of the relationship between the human development index on the one hand and the economic growth in Jordan on the other hand. The study draws on its importance as one of the rare studies that examined the impact of human capital development on economic growth in Jordan, using a new methodology to achieve the objectives of this study, and proposing recommendations to decision makers for their use in planning and decision making. The importance of this study stems from Jordan's interest in promoting itself as a country with a comparative advantage in the availability of qualified human capital, which leads to increasing demand for Jordanian labor abroad and enhancing the attractiveness of foreign investment in Jordan.

2. PREVIOUS STUDIES

The interest in human capital development as an end and a major source of economic growth has become an urgent need for all countries, especially those lacking economic resources. Despite the large number of international studies in this field, there are few studies at the regional and local level that dealt specifically with the relationship between human capital development and economic growth. Most studies have examined the impact of investment in human capital on economic growth. At the international level, Lucas (1990) emphasizes the importance of human capital accumulation in achieving economic growth, and Romer (1990) suggests that human capital can positively and directly affect productivity by enhancing economies' ability to innovate new technologies. In the Barro (1994) study of 98 countries, the results of the study showed a positive correlation between the increase in the number of students enrolled in schools and the increase in per capita GDP. In the study of Chuang (2000), which examines the causal relationship between human capital accumulation and exports and economic growth in Taiwan, results show that the accumulation of human capital promotes economic growth and stimulates exports, while exports promote long-term growth by accelerating capital accumulation. Thus, the Taiwan case study supports the theory of internal growth based on human capital and the premise of export-led growth. Safdari et al. (2010) examined the impact of human capital on the economies of 104 countries during the period 1980-2005. Human capital positively and indirectly affects economic growth through the rapid transfer and resettlement of technology from abroad, while human capital positively and directly affects economic growth through local innovation. The Hanushek (2013) study, which covered a number of developing and developed countries during the period 1981-2008, showed that developing countries have made significant progress in bridging the gap between them and developed countries in terms of educational attainment and enrollment (Educational Quantum), but It was less successful in bridging the gap between it and developed countries on the quality of school education and the development of cognitive skills (Educational Type). The study also found that if developing countries can not improve the quality of education, they will find it difficult to improve long-term economic performance. In the Jozicic (2016) study of Croatia, the study aims to determine human capital in Croatia and indicates the human capital factor in

Croatia. In this study the human capital quality is determined by the quality of the education system and investment in education. The results showed that the investment in human capital in Croatia is insufficient investment and the Croatia public expenditure on education in 2011 amounted to 4.16% of GDP, which that Croatia is placed below the average of OECD countries which amounted in average of 6.1% or to EU countries 5.8% of GDP. Mariam (2017) examine the role of human capital in improving the competitiveness of the firms in Algeria, and the relationship between the human capital and firm competitiveness. The study case was on three insurance companies and to achieve the goal of study a questionnaire was distributed and interviews were done in the chosen companies, the result was statically analyzed by SPSS program, the findings show that the role o human capital is apparent in improving the competitiveness of insurance company. At the local level, a few studies have been conducted on the relationship between economic growth and human development components, such as measuring the impact of education on economic growth, analyzing the impact of human capital on exports and economic growth, and examining the nature of the relationship between population growth and economic growth. One of these studies was the Al-Tal study (1991), which aimed to measure the impact of education on economic growth in Jordan (1971-1988) using Schultz and Denson, and found that the effect of education was positive in the primary and secondary stages and negative impact in the upper stage using the Schultz model. The results showed that the contribution of the basic and higher stage was positive and the secondary stage was negative due to the widespread unemployment among secondary and university graduates due to the inability of the economy to absorb the outputs of education. By examining previous studies, it did not specifically address the impact of human capital development on economic growth, but rather the impact of certain elements of human development, such as education, health, human capital, and population growth on economic growth. While some studies have shown the positive and obvious impact of the human factor on economic growth, some studies have shown the need for more human development efforts to reach the desired economic growth through the role of human capital may play a larger role and shorten the time by positively influencing growth Economic development by focusing on the quality of education, technology transfer, localization, and innovation focus. In addition, local studies did not address the human development indicators of the United Nations in studying their relation to local economic growth. This study has distinguished from other studies that it dealt specifically with the impact of human capital development on Average worker productivity in Jordan, and used the Human Development Index as a representative variable for human capital development, And the real productivity of the Jordanian worker as a representative variable for economic growth in Jordan.

3. HUMAN DEVELOPMENT IN JORDAN

Human development is an important issue in Jordan, on which further economic growth depends. Recent decades have seen tangible progress in the areas of health and education and improved average per capita gross income. Countries are classified according to the Human Development Index to three levels:

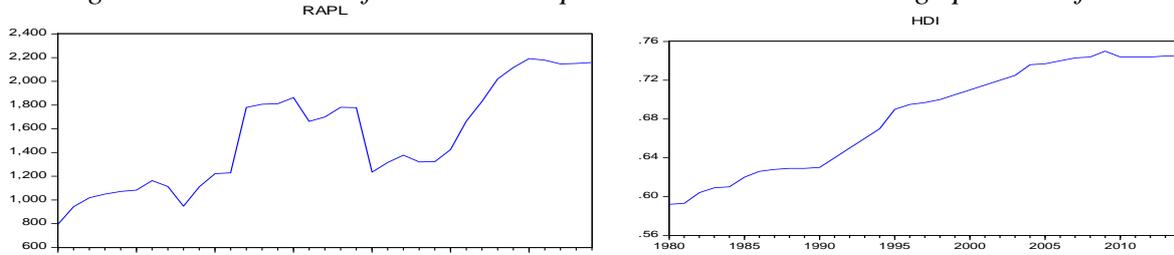

1. High human development, with the human development index (0.8-1.0).
2. Medium human development, with a human development index (0.5 - 0.799).
3. low human development, with a human development index of less than (0.5).

The human development index ¹(HDI) measures the level of economic and social development of countries based on criteria relating to education, health and the level of per capita income (Todaro and Smith, 2015). Its value is determined on the basis of the arithmetic mean of three indicators that reflect the quality of life experienced by citizens in a country.

¹HDI = (1/3) [HI + EI + II]

These indicators are the health index (HI), the education index (EI) and the income index (II). The United Nations Human Development Reports (HDI) showed a steady improvement in the HDI in Jordan, where the HDI was 0.59 in 1980, and the index rose slightly in 1990 to 0.62, (0.74) in 2014. Despite this steady improvement in the value of the index, Jordan's ranking in the human development ladder has declined in general. It was ranked 70th in 1990 and ranked 100th in 2013, and in 2014 Jordan's ranking in the Human Development Report provides 23 positions to rank 77th globally. The result of the decline in Jordan's ranking during the period 1990-2013 can be explained in spite of the fact that the HDI has improved as an absolute value as a comparative indicator, as other countries may have taken faster steps in improving the human development levels of their peoples than domestic ones. Annex (2) shows that the general trend of the Human Development Index and the Education, Health and Income Index in Jordan during the study period. With regard to the human development index, many criticisms have also been made. Some believe that the relationship between the components of the index itself is objected to their inclusion in a single composite index. Some may cancel the effect of the other, and the correlation between the indicators is high. With the exception of the income index, the other indicators are long-term and their impact in the short term (human development report, 1995).

Figure 1: the timeline of human development index and real average product of labor

Source: The researcher's calculations based on the data in Annexes 1 and 2.

Figure (1) shows that the general trend of the HDI index is rising steadily during the study period. The RAPL index is fluctuating during the study period. This is because the rate of increase in real Jordanian GDP for some years of study Less than the rate of increase in the number of employees, in addition to the impact of structural adjustment programs (SAP).

4. DATA SOURCES AND STUDY MODEL

4.1. Data sources and diagnostic tests

The study is based mainly on the official Jordanian statistical data published by the Department of Statistics, the annual publications of the Central Bank of Jordan, the annual reports issued by the Jordanian Ministry of Labor, the Jordanian Ministry of Education, the Jordanian Ministry of Health, the Ministry of Planning, as well as World Bank publications and the United Nations Development Program (UNDP). In this study, the descriptive and standard methods were used. Diagnostic tests were carried out to use the appropriate standard model to analyze data during the study period (1980-2014). These diagnostic tests include the stationary unit root tests (the augmented Dicky Fuller test and the Philips Peron test), the Multicollianarity test, the Autocorrelation test, the Hetroscedasticity test, the stability tests (Cusom Test and Cusom Square Test), and the Ordinary Least Square method (OLS) was used as a standard analysis tool.

4.2. Study model

For the purposes of this study, the average income criterion for measuring economic growth (as mentioned earlier in the theoretical framework of the study) will be used by dividing the real

GDP on the number of labors in Jordan (RAPL) as a proxy variable of economic growth, and The Human Development Index (HDI) will be used as a proxy variable of human capital development in Jordan. Based on what was put forward in the theoretical framework of the study, and using the writings of many researchers in this field, the study used the Modified Solo model with MRW methodology (Mankiw, Weil, Romer) to measure the mutual impact between human development and its components and economic growth in Jordan. Modified Solo model with MRW methodology was adopted because it relies on the hypothesis that human capital accumulates with the same technique of physical capital accumulation, allowing it to be expressed in physical units rather than in units of time. By analogy, the study relies on the hypothesis that human development accumulates with the same capital accumulation technique Material. The Solo model indicates that the volume of production (Y) is determined by the factors of production (L) and capital (K) according to the equation:

$$Y = F (K \cdot L) \dots \dots \dots (1)$$

By dividing the two sides on (L), the equation becomes as follows:

$$Y/L = F (K/L) \dots \dots \dots (2)$$

Whereas:

Y/L: The average productivity of the Jordanian labor (APL).

K/L: Average Jordanian labor Share of Capital.

In order to analyze the impact of human capital development on economic growth in Jordan, the Human Development Index (HDI) will be added to Equation (2), based on the hypothesis that human development will accumulate in the same technique as the accumulation of physical capital.

In accordance with Modified Solo model with MRW methodology, the equation is as follows:

$$APL = Y/L = F (K/L \cdot HDI) \dots \dots \dots (3)$$

Since the study is based on the real values of the model variables attributed to the price index (CPI), the previous equation becomes as follows:

$$RAPL = F (RK/L \cdot HDI) \dots \dots \dots (4)$$

To estimate the model used in equation (4), the following mathematical formula will be used:

$$RAPL = \alpha + \beta (RK/L) + \gamma HDI + U \dots \dots \dots (5)$$

Where:

RAPL: real average product of labor (proxy variable of economic growth)

RK/L: average labor share of real capital.

HDI: human development index (proxy variable of human development).

α , β , γ : model parameters.

U: random error.

In order to understand these variables, they need to be further clarified. One of the important indicators that reflects the economic growth rate is the RAPL.

For the purposes of this study, the real average productivity of the Jordanian labor was used as a sign of economic growth in Jordan, The average productivity of the Jordanian labor (RAPL) is calculated by dividing the real gross domestic product (RGDP) by the number of labors (L) multiplied by 100, and can be represented by the following equation:

$${}^2\text{RAPL} = \frac{\text{RGDP}}{\# \text{ labors}} * 100 \dots \dots \dots (6).$$

Annex (1) shows the real time productivity of the Jordanian labor.

Many studies have used this indicator as a representative variable for economic growth, including Talafheh (1989) and Al-Mansi (2013). This index falls under the criterion of average income, which is one of the most widely used and most reliable standards when measuring the level of economic progress in most countries of the world. However, there are many problems and difficulties faced by developing countries to obtain the correct figures that represent real income per capita, and whether we divide the total national income on the whole population or divide it into the working population only. The calculation of income for the whole population benefits from consumption, others are useful in terms of production (Ajamia and Nazif, 2000). With regard to the accumulation of capital and the role of investments in the economy, the Harrod-Domar model considers that new investments are compensated for the loss of financial assets in the community and are therefore a key factor in economic growth. To enable these investments to emerge, the community must save a sufficient proportion of its income for these investments. The model indicates that the main factors on which national income growth depends are the marginal tendency of savings and capital productivity represented by the average worker share of real capital.³ICOR was used to estimate this variable as shown in Annex 3. And also the relationship between the human development index (which measures human development) and economic growth can be illustrated as follows: Human development leads to innovation and creativity in various fields, thus increasing productivity, improving employment opportunities and achieving higher rates of economic growth and health of community members. If those innovations and creativities are exploited in the form of practical applications, thereby improving the level of economic well-being at the community level as a whole.

5. RESULTS OF STANDARD ANALYSIS

In order to test the hypotheses underlying the study, the diagnostic tests were performed to determine the appropriate standard models, and then to analyze these models using the OLS method. According to Gauss-Markoff's theory, OLS gives the best linear unbiased estimators Provided that standard models are free of statistical problems (Gujarati, 2003).For the purposes of this study, the statistical package (E views 9) was used. The results of the diagnostic tests showed that the standard model used to investigate the impact of human capital development on the average productivity of Jordanian labor is stable and stationary at the first difference, as shown in Annex 4,And does not suffer from the problem of multiple-line (Multicolliarity) as shown in Annex (5), does not suffer from the problem of autocorrelation, and the model is free from the problem of the lack of stability of the discrepancy of errors (Hetroskedasticity) as shown in Annex (6) ,The parameters of the model are highly stable over the period of study, as shown in Annex 7, and therefore the OLS method has been used as a standard analysis tool.

²This means productivity at the level of the gross domestic economy.

³Capital (K) was calculated in the Jordanian economy using the ICOR method by dividing the total net real gross capital formation during the study period by the difference in real GDP between the last year of the study and its first year, and then multiplying this percentage in GDP for the first year, The estimated capital in the economy is produced during the first year, and by adding the net capital formation for the first year to its estimated capital, the estimated capital is generated in the second year. The process continues by adding the net capital formation of any year to its estimated capital in the subsequent year, and so on.

The OLS conditions are now available to provide the most efficient linear estimates Unbiased for parameters. Since the model variables are stable and stationary at the first difference, equation (5) becomes as follows:

$$D(RAPL) = \alpha + \beta D(RK/L) + \gamma D(HDI) + U \dots \dots \dots (5-A)$$

For the purposes of this study, Dummy Variables were used as representative variables for structural adjustment programs (SAP), these are relatively modern policies whose origins were linked to the bursting of the external debt crisis that swept through developing countries in 1982. They can be defined as a set of economic measures recommended by the International Monetary Fund and the World Bank aimed at stabilizing the economy by addressing financial distortions (2003). These policies were applied to the Jordanian economy in 1989 and 1990 as a result of the financial crisis of 1988, which led to the decline of the Jordanian Dinar exchange rate, 2000 and 2001 due to the rapid privatization shift, and the years 2008 and 2009 Due to the effects of the global financial crisis and its repercussions on Jordan and the region, and in 2013 by the Syrian asylum crisis. And the impact of structural adjustment programs (SAP) on the variable D (RAPL) and independent variable D (RK / L) was dropped. Therefore, the final form of mathematical formula, which will be subject to statistical estimation as follows:

$$D(RAPL) = \alpha + \beta D(RK/L) + \gamma D(HDI) + Dum * D(RAPL) + DUM * D(RK/L) + U \dots \dots \dots (5-B)$$

Using the OLS method, the results obtained were as follows:

Table 1: The results of the standard analysis of the impact of human capital development on the average productivity of the Jordanian labor

Dependent Variable: D(RAPL)				
Method: Least Squares				
Date: 09/29/18 Time: 00:29				
Sample (adjusted): 1981 2014				
Included observations: 34 after adjustments				
Prob.	t-Statistic	Std. Error	Coefficient	Variable
0.0328	-2.241722	18.45408	-41.36891	C
0.0000	8.273971	0.039497	0.326798	D(RKL)
0.0867	1.773379	2522.249	4472.903	D(HDI)
0.0034	3.195683	0.376244	1.202356	DUM*D(RAPL)
0.0015	-3.514698	0.106084	-0.372854	DUM*D(RKL)
40.13822	Mean dependent var	0.837316	R-squared	
161.7589	S.D. dependent var	0.814876	Adjusted R-squared	
11.45841	Akaike info criterion	69.59839	S.E. of regression	
11.68288	Schwarz criterion	140474.1	Sum squared resid	
11.53496	Hannan-Quinn criter.	-189.7930	Log likelihood	
1.896487	Durbin-Watson stat	37.31480	F-statistic	
		0.000000	Prob(F-statistic)	

Estimation Equation:

$$D(RAPL) = C(1) + C(2) * D(RKL) + C(3) * D(HDI) + C(4) * DUM * D(RAPL) + C(5) * DUM * D(RKL)$$

Substituted Coefficients:

$$D(RAPL) = -41.3689089819 + 0.326797665562 * D(RKL) + 4472.90323563 * D(HDI) + 1.20235552554 * DUM * D(RAPL) - 0.37285377891 * DUM * D(RKL)$$

Table (1) shows that the estimated parameter value of the variable of the Jordanian worker's average share of capital (RK/L) was positive. The increase of (RK/L) in one unit will increase the real average productivity of the Jordanian worker (RAPL) by approximately 0.33 units, With the stability of the other factors, and the effect of the average Jordanian share of capital (RK/L) is significant at the level of (1%) as shown by t-statistic, This means that there is a positive and statistically significant relationship between the average Jordanian worker's share of the capital and the real average productivity of the Jordanian worker. The results also indicate the positive impact of the HDI on economic growth. When the human development index (HDI) increases one unit, the average real productivity of the Jordanian worker (RAPL) increases (4472.9) unit, Since the Human Development Index (HDI) is between (0-1), the increase in the human development index (0.1) increases the average real productivity of the Jordanian worker (447.29) units (JD). And the impact of the HDI is statistically significant, as shown by the t-statistic. This means that there is a positive and statistically significant relationship between the HDI and economic growth represented by the real average productivity of the Jordanian worker (RAPL), This confirms the validity of the hypothesis from which the study was launched, which states that there is a positive impact of the human capital development on the productivity of Jordanian worker and thus on economic growth as a whole. The value of the (R^2) indicates the amount of independent variables interpreted by changes in the dependent variable (RAPL) and that the explanatory capacity of the model is (83.7%).As the adjusted (R^2) value indicates, 81.4% of the change in RAPL can be explained by a change in the independent variables of the model (Equation).The result of the F-statistic test showed that the model as a whole has statistical significance at the level of 5%. The calculated F-statistic value was 37.3, which is relatively high. Just as the model is free of autocorrelation, the ⁴(DW) value is 1.896487, and this value approaches 2.

6. DISCUSSION OF FINDINGS AND RECOMMENDATIONS

In this study we discussed the relationship between human capital development and the average productivity of the worker in Jordan during the period 1980 to 2014. The results of the standard analysis showed that there is a positive effect of the human development index on the average productivity of the worker in Jordan. This means that the model used is consistent with the theories that the study was launched, and this result is logical because production processes in the Jordanian economy depend on qualified and trained workers rather than on advanced technology and capital, where the production method in the Jordanian economy is labor intensive (Labor Intensive Technology).The results of this study are consistent with the results of many previous studies on the impact of human capital accumulation on economic growth, whether such studies are universal such as Barro (1994), Hanushek (2013) and others, or regional studies such as the study of Khatib (2005), Sabki(2014), or local as the study of Al-tal (1991) and the study of Zoubi and Al- tal (2003).The results of the study indicate that Jordan can be classified in terms of human development during the study period at a moderate level of human development, despite the steady improvement in the value of the indicator. However, Jordan's ranking in the overall human development ladder has declined. Based on the findings of this study, it recommends that future studies be undertaken at the sectoral or intersectoral level, as it addressed human development and its impact on economic growth without investigating the impact of the sector to which the worker belongs (industry, agriculture, services). The study also addressed the reality of one country in the Middle East, therefore Regional or inter-country studies are recommended, And that this study should be the reason for more detailed future studies, and that the studies should focus on the nature of the relationship between human development and its components (education, health and income) and economic growth in Jordan.

⁴To ensure that the model is free of autocorrelation, Breusch-Godfrey serial correlation LM test was used as shown in annex 7.

The study also recommends that further efforts be made to address the qualitative aspects of health, education and cognitive skills, to promote innovations and to improve justice levels in income distribution, in order to increase human productivity and improve the value of the indicator.

ABSTRACT

The article analyzes the current ecological and economic situation of the natural resource potential of the Republic of Azerbaijan. One of the key issues within the framework of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" is to achieve ecological and economic balance. For this purpose, the important part of the Republic's environmental policy is to protect the existing ecosystems to meet the needs of present and future generations. One of the key factors for sustainable development is the protection of the environment and the solution of environmental problems. Thus, some of the provisions proposed in the 21st century are related to the protection of the environment and the rational use of natural resources. In order to ensure sustainable development in our country, it is important to utilize complex minerals and primary raw materials. Continuous increase in the number of population, rapid development of science and technology also increases demand for raw materials and products. The complex utilization of natural resources has already been formed in relation to oil and gas. Its economic assessment and stimulation are fully implemented. Certain institutional measures have been taken to ensure the systematic management of the environment and natural resources in accordance with the principles of transition to sustainable development. The most obvious example of this is the creation of the Ministry of Ecology and Natural Resources in Azerbaijan. The article considers the mineral resources resources, the ecological and economic aspects of their use, and the environmental impact dimensions. Sustainable development has been highlighted in the future use of fuels and ore sources. It was noted that limited land, water and forest resources of our republic should be utilized and recultivation and reclamation measures should be taken to eliminate environmental damage. Measures are taken to ensure environmental sustainability in accordance with the main objectives of the "Azerbaijan-2020: A Look Into Future" development concept. Sustainable development is a development that ensures the needs of the present day without endangering the possibilities of future generations. The ecological and economic aspects of this development include the oceans and seas, climate change, environment, waste management, ecosystems and biodiversity. Effective and comprehensive use of our country's natural resource potential, including biodiversity conservation, neutralization of the negative impact of the fuel and energy complex on the environment, restoration of useless areas and the effective protection of existing resources, will continue in the coming years as well. Ecological and economic aspects of the use of natural resource potential in sustainable development of the Republic of Azerbaijan.

Keywords: *resource, potential, environment, sustainable development, conditions*

1. INTRODUCTION

The favorable natural-geographical location of the Azerbaijan Republic created conditions for having rich natural condition and resources.

The countries' various natural resource potential, the development and the situation of production and social infrastructure, useful transport, geographical position, the efficient organization of territory are very crucial. In respective development, the improvement, expansion, and reconstruction of economic and territorial structures of the economy are of great strategic importance. According to researches, in addition to the natural environment and other factors that contribute to the economic and social development of the country, inequality in setting a resource potential has created a sharp difference in the level of economic development. Particularly, accumulation of industrial areas in Baku has led to their rapid development comparing with other regions as well as the aggravation of the socio- economic situation in the regions and the flow of people from regions to the capital. As a result this has contributed to the aggravation of the social, economic, and ecological situations in many places. Also due to the deployment and the development of productive forces, improving the effectiveness of territorial organization of the farm, important regional environmental problems arise from the character and peculiarities of these processes. The emerged situation puts forward the socioeconomic development of the regions, the optimization of the differences between them as an important task on the government level. One of the main objectives of the "State Program on the Socio- Economic Development of the regions of the Azerbaijan Republic in 2014-2018" and "Azerbaijan 2020: A look Into the Future development concept" is to achieve the ecological and economic balance. The main objective of the Republic's environmental policy is to ensure sustainable development through the protection of the existing ecosystems and the rational use of natural resources in order to meet the needs of the present and future generation.

2. LEGAL REGULATION OF THE USE OF NATURAL RESOURCE POTENTIAL AND ENVIRONMENTAL PROTECTION IN SUSTAINABLE DEVELOPMENT

As shown in all international documents, efficient and integrated use of local natural resource potential, environmental protection and solving environmental problems are important factors for sustainable development. From this point of view, consonant development requires environmental protection and continual use of natural resources. Thus, some of the regulations outlined in the current tasks of 21st century are related to the protection of environment and the rational use of natural resources. [10,11,12]. In recent years, certain work has been carried out in order to solve environmental protection and ecological problems in our country. In this regard, a legal basis for the protection of the environment and the productive utilization of natural resources has been created in order to ensure continual development in Azerbaijan. During the period after Rio conference, about 20 national laws on health of population, environmental protection, environmental safety, rational use of natural resources have been adopted. Example of this are "Law on Plant Protection"(1996), " Law on the Protection of the Health of Population"(1997)," Law on Fishing"(1998)", " Law on Earth"(1998), " Law on Environmental Protection"(1999)," Law on Animal World"(1999), " Law on Ecological Safety"(1999)," Law on Atmospheric Air Protection"(2001)," Law on the Compulsory Environmental Insurance", (2002)," Ecological Education and Enlightenment "(2002)," Ecologically Clean Agriculture"(2008) and other laws. The events included in the state programs like "Ecological Socio- Economic Development in the Republic of Azerbaijan "and " Restoration and Improvement of Forests in the Republic of Azerbaijan ", " Hydrometeorology Development Program", " Efficient Use and Development of Natural Stone Deposits un Absheron Peninsula and Prevention of Desertification" confirmed by the President of Azerbaijan were successfully implemented. A number of projects related to the "Comprehensive Action on improving the environmental situation in Azerbaijan Republic for 2006-2010" have been successfully implemented. Generally, mineral resources being complex natural products play a very important role in the technical, economic, ecological and social development of the society.

For this reason, the importance of the use of mineral resources for ensuring consonant development in certain countries in the modern world is steadily increasing. This issue is also reflected in the sustainable development concepts adopted in the CIS and Eastern European countries [13,14,15,16,17]. The mineral resources of the Earth are an integral part of the overall resources and are one of the key factors determining the socio-political independence of our country. The increase of the economic potential of the Republic of Azerbaijan depends on the efficient use of resources of various mineral deposits, which have been explored in its territory, and the development of mining and processing industries. The territory of our republic is rich in mineral resources, including raw materials such as oil and gas, ferrous and non-ferrous metals, construction materials, stone salt, barite, etc. as well as minerals, thermal, industrial water, and these raw materials are of great industrial and economic importance. Exploration of minerals does not only provide sustainable development, but also are a major cause of environmental protection problems. Although the exploitation of minerals with open-pit methods is inexpensive, this process reduces soil fertility, causes change in relief, erosion, poisoning of water and plant, and being unusable. The wells and the ditches during the geologists' searches and explorations damage the top layer of soil. Therefore, while drafting geological projects, the measures for land cultivation and environmental protection are taken into consideration. The complex use of mineral resources and primary raw materials in the sustainable development in the Republic of Azerbaijan comes from the need to meet the requirements of farms for various products and meet the needs of population for different expenditures. Continuous increase in the number of population, rapid development of science and technology also enlarges the demand for various raw materials and products. This, in its turn, requires a complete and comprehensive approach to the processing of primary raw materials, which is more important than economic, social and environmental point. Complex utilization of natural resources is one of the main principles of consonant development in our country, which has already been formed in relation to oil and natural gas and its economic evaluation, stimulation is completely carried out. Great sources of these resources are on the shelf of Caspian Sea. The calculations show that if 20-30 mln. tons of oil are produced, it will allow oil production for 100 years. Oil has been produced with industrial method in Absheron peninsula since 1871. Now very rich oil and gas deposits have been discovered on the shelves of the Caspian Sea, especially in Baku and Absheron archipelago, in Aran and Ganja-Gazakh regions and search projects are in process. During the last period, 40 percent of potential oil reserves and 20 percent of gas reserves have been utilized. As mentioned above, alongside with oil and gas, a large amount of construction materials, mineral, thermal and iodine-bromine waters, ore, non-ore, chemistry and other types of raw materials are available in the Azerbaijan Republic. The greater and Lesser Caucasus, Nakhchivan are particularly rich in ore foliage. Filizchay polymetal in Sheki-Zagatala district, iron ore reserves in Dashkasan district are located in large deposits. Being about 280 million tons, Dashkasan's iron ore reserves are considered to be the largest deposit in the South Caucasus. Some part of iron ore were found in Gadabay, Ordubad and Shamkir districts. The northern slope of the Lesser Caucasus is rich in cobalt, sulfur arsenic, copper ore, granite, marble, fusilli limestone, barite, and other resources. Large copper ore deposits are also found in Tovuz, Gazagh, Dashkasan, Ordubad deposits like Filizchay, Kasdag, and Katex in Sheki-Zagatala as well as in Gadabay. Aluminum, polymetallic, copper, gold, lead, zinc, molybdenum, mercury, cobalt, and sealite reserves are of industrial importance in our republic. Zunlik's alunite is a complex raw material, from which aluminum oxide, sulfuric acid, sulfur dioxide, potassium fertilizer and potassium salt are extracted. Polymeric ore reserves are widely spread throughout the country. Although there is a large amount of ore reserves in Mehmana, Nakhchivan, Gumushlu, Paragachay, Gapichig, and Balakan, but still not exploited by industrial methods [2,3]. In recent years, 2500 tons of silver, 400 tons of gold, 1.5 million tons of polymetallic deposits are found in the territory of

the republic. According to experts, gold reserves are more than 1,000 tonnes of gold-sulfide in Kelbajar, Agdera copper quartz gold, Gold-copper-golden in Gadabay, quartz-gold in Zangilan, Gazakh and Tovuz. Mercury reserves have been identified in more than 50 fields. 6 mercury deposits were discovered in Kalbajar-Lachin economic region, including the Şorbulaq, Agyatag and Lohchai deposits. In general, lead reserves are estimated at \$ 1.7 million. tons and its 1.54% contains metal. (8). Ganja-Gazakh economic region is rich in many natural resources, including bentonite clay, which is widely used in various industries, especially in the oil industry. Dash Salahli bentonite clay deposit of Gazakh region has raw material reserves applied to different fields. This raw material is widely used in ferrous metallurgy, iron ore rollers, oil extraction, building materials industry, construction of irrigation facilities, and winery. Over 400 different types of non-ore and building materials have been discovered in the country. The total inventory is 403.5 mln. tons of cement, worth 477 million cubic meters. km, 55 million km. cube km, with 3.7 million km. cubic km of stocks of decorative stone with reserves 16 mln. cubic km of ceramic raw material, reserves of 204.4 mln. cube km construction stone, 160.7 mln. cube km clay, 1.03 bn. cube km sand and gravel, 48.4 mln. cube km sand, 13 cubic km contains caution pearl and pumice deposits. Upper Aghcakand high quality bedding together with others gives 500,000 tons of plaster a year, which is widely used in industry and agriculture [7,8]. Apparently, as a result of the geological exploration, various types of non-ore-extraction and building-construction materials have been discovered and produced in several regions of the Republic, with their raw material reserves being represented by 39 deposits in the State balance. The Greater Caucasus, the Lesser Caucasus, the Nakhchivan natural regions, the Lankaran-Masally region are rich in mineral and thermal waters. In accordance with the Decree of the President of the Republic of Azerbaijan dated February 5, 1996 "On Exploration and Development of a number of gold deposits of the Republic of Azerbaijan" for the purpose of the establishment of the gold mining industry in the republic, on August 20, 1997, "Azergizil" Investment Group Sevrvices LLS has signed an agreement on Exploration, Development and Production Sharing in Gadabay, Gosha, Ordubad Group (Piyazbashi, Agyurd, Shakarda, Keleki), Soyudlu, Gizilbulag and Vejnali prospect and signed by the Armenians in the occupied area since 2005 and additional exploration works were started on other fields, except for Soyudlu (Zod), Gizilbulag and Vejnali deposits, and was completed in 2008. At present, the state program for non-metallic metallurgy, as well as for the development of ferrous metallurgy has been adopted. Domestic and import-substituting chemical industry has been one of the most developed areas of the republic, providing the CIS space with certain products. The products of propane, potassium, butane-butylene and benzene, and products of the mining industry are developing chemical industry. Nakhchivan's salt deposits, as well as barite, sulfur arsenic, kopal, dolomite and mineral dyes are promising resources for the chemical industry. Raw materials such as the salt lake in the lower streams of the Kura river, Mughan plain, Bigshore in Absheron, Masazir lakes, Chili shoras, Mirabilit are important. Epsomite and molanteritis in the Nakhchychay field in Nakhchivan, such as umbra, sori, siena, breccia in Shamakhi, Gadabay and Goygol regions are useful. As a product of the basic chemical industry, there are sufficient raw material reserves for the production of iodine and bromine. Seolite is widely used in petrochemical industry, oil refining, chemical industry, agriculture and metallurgy. The large deposits of Seolite are found in Gazakh, Tovuz, Nakhchivan, Talysh, in the Lesser Caucasus. Reserves of iodine-brominated water in the country are 250,000 cubic miles per day [8]. At present Neftchala and Khilli deposits are operating on the basis of Neftchala and Absheron mine waters Surakhani iodine-bromine factories. Changes in the field and territorial structure of chemical industry in recent years, giving priority to small and medium-sized enterprises, especially private enterprises, have been aimed at meeting the growing demand for the economy and the population, protecting the environment, and rational utilization of raw material resources, which in economic and ecological terms right.

Recent purposeful economic reforms, privatization, privatization and state care for entrepreneurs have also impacted the construction sector, as other industries, increased production of new materials, increased quality and played an important role in environmental protection. In general, being a complex natural product, mineral raw material resources play a very important role in the socio-economic and social development of society. For this reason, the importance of mineral resources is constantly increasing to ensure sustainable development in modern times. Mineral resources are one of the main factors determining the economic and socio-political independence of our country, being an integral part of the overall natural resources. Increasing the economic potential of the Republic of Azerbaijan depends on the efficient use of resources of various mineral deposits, which have been explored in its territory, and the development of mining and processing industries. In addition to the mineral resources registered in the state-owned and state-owned reserves, prospecting and geological exploration works were carried out on many ore occurrences and their initial reserves were assessed.

3. ENVIRONMENTAL AND NATURAL RESOURCES MANAGEMENT

Certain institutional measures have been taken to ensure the systematic management of the environment and natural resources in accordance with the principles of transition to sustainable development. The most important of these events is the establishment of the Ministry of Ecology and Natural Resources in May 2001 which covers new structures. Azerbaijan also operates at regional level in solving environmental problems. The Caspian Environmental Program (XEP) was established in 1995 with the consent of the World Bank and other international financial institutions with the consent of five Caspian littoral states (Azerbaijan, Russia, Iran, Turkmenistan and Kazakhstan). The main objective of this program is to manage the ecology of the Caspian Sea for a long time and to ensure sustainable development in this area. Azerbaijan has joined about 30 environmental conventions to expand international cooperation in the field of environmental protection and actively participate in addressing global environmental problems, and many of them have been ratified. Our Republic's accession to international conventions is an example of Azerbaijan's contribution to environmental protection and global environmental problems. As it is noted, the Republic of Azerbaijan has wide opportunities as a state with rich natural resources and advanced industrial spheres. However, because of the unresolved ecological problems that have been accumulated over many years, the country's environment has been polluted. Presently, there are a number of environmental problems that require immediate solution to the republic, such as lack of environmentally friendly drinking water, contamination of natural water basins, environmental problems of the Caspian Sea, degradation of soil vegetation, pollution of the environment, waste management and so on. can be attributed. It is necessary to analyze the ways to address these environmental problems on the basis of sustainable development principles. It is known that there are no potential sources of water in order to meet the needs of agriculture in agriculture and drinking water in the country. Water shortage in several regions, particularly Absheron, is explained by the inadequate use of water resources. Due to lack of water network systems, many pipelines have been exploited as a result of many years of operation, and about 45-50% of drinking water is lost due to failure to meet current technical requirements. Extreme pollution of Kura and Araz rivers, the largest rivers of Azerbaijan through the domestic and industrial wastes discharged from neighboring states - including Georgia and Armenia, including the settlements and industrial facilities of our republic, is also a major problem. The quality of water in the pouring of the river into the Caspian Sea is only for technical purposes. The condition of the treatment facilities is also unsatisfactory. Only 35 of 75 cities of the Republic have water treatment facilities. They are also equipped with mechanical cleaning tools. In Baku, the total volume of polluted water is about 1.2 mln. cubic meter which is only 50-60% cleaned [7,8]. As shown, the rise in the level of water in the Caspian Sea has completely affected the coastal strip

of the Republic of Azerbaijan. In the disaster zone includes 800 sq. Km of territory, 7 cities, 35 settlements, more than 120 livestock facilities, a number of national farms, 15.3 thousand hectares of pastures, 1.2 thousand hectares of vineyards and 120 thousand ha. land were damaged. Total damage to the Republic of Azerbaijan as a result of sea level rise is estimated at \$ 12 billion [7, 8]. The following measures are required for the implementation of national and regional programs for the development and management of water resources, based on the sustainable development principles of the protection and rational utilization of water resources:

- Implementation and development of state programs and laws for the efficient use of water resources and water ecosystems;
- Improvement of quality of drinking water and stimulation of adaptation to relevant standards;
- Enhancing regional and international co-operation for the effective use of water resources by neighboring states for the protection of Transboundary Rivers from pollution;
- Enhancement of water recycling at industrial and other facilities in order to eliminate water shortages and implementing measures to use non-traditional waters (waste, collector-drainage, wastewater etc.) and irrigation (drip, rainwater irrigation) in agriculture [9].

Since the independence of our country was restored in 1991, due to the breakdown of the existing economic relations, many industrial enterprises in our republic were suspended, some of them operating at a rate of 20-30 percent of the production capacity. In this regard, the amount of harmful substances emitted from stationary sources into the atmosphere has significantly decreased compared to 1990. The following strategic measures are required to address these problems and to ensure sustainable development in the country: Major repairs or replacement of gas-dust storage facilities in industrial enterprises, acceleration of green transport transit and prevention of exploitation of old vehicles not meeting environmental requirements improving the quality of atmospheric air by improving greenhouses around industrial enterprises, residential areas, roadside and neighborhoods, etc.

4. CONSERVATION OF RURAL AND FORESTRY AGRICULTURE, AS WELL AS BIODIVERSITY

One of the major environmental problems in our Republic is the 4.1 million barrels of useful agriculture. ha (47.7% of the territory of the republic) is gradual degradation of lands. So, 3.6 million tons. ha is currently being eroded. 1.3 million ha of them were weak, 1.15 million ha and 1.14 million ha were eroded. Soil salinization process is also of great concern. According to the research 1.5 million. ha land have been salinized [8]. Currently, international financial institutions (World Bank, European Union TESIS program) and foreign countries have been working on cleaning the oil contaminated land, purchasing the required equipment. In order to effectively use the land resources in accordance with the principles of sustainable ecologically sustainable development, the following strategic measures are required in our country:

- Preparation of relevant action plans and national action plan to erode and saline soils available for agriculture, increase fertility;
- Continuation of recultivation works on oil polluted lands in Absheron and Aran IR;
- Accelerate reclamation work by inventory and disposal of existing collector-drainage and irrigation networks;

It is known that the Republic of Azerbaijan belongs to less forested areas. Only 12% of the country's territory is covered with forests. As a result of the economic problems of the transition period, pressure on the forests, military conflicts, fuel and construction, both the area has declined and the quality of the forests is reduced. The protection and rational utilization of this potential is crucial, taking into account the effects of water and soil management functions on

the climate. At the same time, the soil-climatic conditions of the country are quite favorable for the establishment of new forest strips. Establishment of such forest strips is important for supplying raw materials to the chemical, food and woodworking industries, and can give rise to new jobs, which is crucial to the sustainable socio-economic development. The current environmental problems can be partially solved by restoring and expanding forest resources, building new forest lanes, as well as increasing the economically important crops. Therefore, it is expedient to take the following strategic measures for the protection of forests:

- Taking measures on inventory works in the forests of Azerbaijan, prevention and restoration of illegal logging and other forest felling;
- Arrangement of efficient use of forage, fruit and other herbs existing in forests and designing and laying out of new forestry gardens;
- Determining the pressure on the forests taking into account the importance of recreation, and the establishment and use of tourism-oriented recreational potential;
- Solution of employment problems of rural population living in forests covered by forest resources through creation of jobs not related to forest resources;
- Regularly implementation of biological and chemical measures to protect forests from various diseases and pests [7,9].

Biodiversity Conservation after signing the Convention on Biodiversity Conservation in Rio de Janeiro in 1992 by the Republic of Azerbaijan has undertaken a number of measures to meet the requirements of this Convention. Since 1995, Azerbaijan has been a constant participant of the Pan-European Biodiversity Safeguard Strategy. The country has developed action plans for different sections of this strategy, including the development of specially protected areas, protection of rare and endangered species of flora and fauna, restoration of wetlands and development of mountain ecosystems. The Republic of Azerbaijan ratified the UN Convention "On Biodiversity Conservation" in 2000. The State Commission for Genetic Resources of Biological Diversity was established in 2001 under the order of the President of the Republic to fulfill the commitments arising from the Convention. Prepared national programs and projects have been approved by the Government of Azerbaijan in 2001, with the support of the Global Environment Facility and the United Nations Development Program, as reflected in the national report and action plan on Biodiversity Conservation. The Republic has joined more than 20 international conventions to strengthen its activities in the field of environmental protection on the eve of its accession to the Council of Europe in 2001. These include conservation of transboundary rivers, water basins and international lakes, preservation of wildlife and natural environment of Europe, water-wetlands of international significance, primarily for water birds' habitat, and cultural and natural heritage preservation conventions. Two suburban areas - Aggol and Gyzyllagak lakes are listed under the Ramsar Convention. Biodiversity conservation in Azerbaijan has both national and regional as well as global significance. In order to ensure sustainable development in the Republic, the following strategic measures should be taken to protect biodiversity:

- To join all environmental projects, international conventions, other inter-regional and regional agreements on biodiversity conservation within Azerbaijan;
- Monitoring, restoring and enhancing the variety of plant and animal life threatened with specially protected areas, updating the Red and Green Libraries;
- Establishment of new national parks, reserves and sanctuaries to protect biodiversity within the territory of Azerbaijan.

5. ASSURANCE OF SUSTAINABLE DEVELOPMENT AND ECOLOGICAL POLICY IN AZERBAIJAN REPUBLIC

One of the main goals of the "AZERBAIJAN 2020: A LOOK INTO FUTURE" DEVELOPMENT CONCEPT, confirmed by the Decree of the President of the Republic of Azerbaijan dated December 29, 2012, are to achieve ecologically sustainable socio-economic development. Waste management, neutralization, recycling and utilization, as well as the application of low-waste or non-waste technologies are being undertaken in order to protect raw materials, rational use of natural resources and protect the environment, and this process will continue. In order to effectively manage land resources, the work to be done to prevent desertification processes, recultivation of useless lands as a result of activities of large industrial and mining facilities, improvement of efficient use of agricultural lands will be expanded; measures will be taken to strengthen the fight against land anthropogenic pollution. In addition to this, practical steps will be taken to improve the existing environmental protection legislation in line with international best practices, to improve the effective monitoring and control mechanisms, and to create new ones. At the same time, the necessary infrastructure for the expansion and support of scientific research activities in the field of ecology will be created. Special attention will be paid to informing the public about the expansion of international cooperation in the field of environmental protection and the promotion of the environment protection culture. In 2015, world leaders have confirmed the 2030 Agenda for Sustainable Development, the universal path leading to the solution of all available human challenges. A total of 17 universal sustainable development goals and 196 targets have been defined to achieve the agenda by 2030. In the establishment of the National Coordinating Council on Sustainable Development in October 2016 to coordinate the implementation of sustainable development goals in Azerbaijan, our country has shown its commitment to achieving the 2030 Agenda. IDEA has been successfully cooperating with the UN in a number of projects aimed at promoting Sustainable Development Goals in Azerbaijan. Many joint campaigns, including the United Nations Development Program, the UN Food and Agriculture Organization (FAO) and FAO, are planned to be completed by the end of 2018. Last year, the Voluntary National Report on Preliminary Steps to Implement the Transformation of Our World: Sustainable Development Agenda up to 2030 was prepared and submitted to the High Level Political Forum in Azerbaijan. "Sustainable development is a development that meets the needs of today without endangering future generations," and the ecological and economic aspects of this development cover the oceans and seas, climate change, environment, waste management, ecosystems and biodiversity goals. In order to achieve this, it is of particular importance to balance the relationship between man and nature. As noted, sustainable development involves three key elements - the economy, society and the environment - in this regard, after the independence of the Republic of Azerbaijan and choosing the path to market economy, environmental policy in the field of environmental protection has become new and shaped in our country. This is also explained by the perception of environmental issues as a universal problem. In this period, the first environmental policy document in our Republic is "Environmental Concept of the Republic of Azerbaijan" (2003), based on the principles of "Sustainable Development". The main goal of the environmental policy pursued in the Republic of Azerbaijan is to ensure sustainable development through the protection of existing ecological systems, economic potential and rational use of natural resources in order to meet the needs of present and future generations. In order to accomplish this, the ways to use natural resources have been developed and the development of the economy has begun on the basis of sustainability principles.

6. CONCLUSION AND SUGGESTIONS FOR FUTURE RESEARCH

In order to ensure that the economic development of the country is environmentally sustainable, it is necessary to eliminate serious environmental problems that arise during economic activity

and to minimize negative environmental impacts. Taking into account the current ecological situation and socio-economic situation, the following directions of the ecological policy of our republic can be defined:

- Implementing progressive methods of Sustainable Development Principles with a view to ensuring environmental safety at the expense of the Republic's natural resource potential, with a view to ensuring that environmental impacts are minimized and protected;
- Comprehensive utilization of natural resources for sustainable development, utilizing alternative and inexhaustible energy sources and achieving energy efficiency;
- Assessment of cooperation and needs at international, regional and national levels on global environmental problems, identification of solutions.

Sustainable development issues in our Republic are covered by the "State Program on the Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018" and the Strategic Road Map of the Republic of Azerbaijan on the National Economy Perspective approved by the Decree No.1138 of the President of the Republic of Azerbaijan dated December 6, as well as ensuring the ecological balance as one of the main goals set forth and forthcoming. Effective and comprehensive use of our country's natural resource potential, including biodiversity conservation, neutralization of the negative impact of the fuel and energy complex on the environment, elimination and protection of marine and its aquifer pollution, restoration of useless territories and effective protection of available resources will continue in the coming years.

THE ROLE OF INVESTMENTS IN RESOLUTION OF SOCIO-ECONOMIC PROBLEMS

Niyazi Hasanov

University of Economy, Azerbaijan
niyazisan@gmail.com

ABSTRACT

The article is devoted to the investigation of the current level of investment attractiveness of the regions. Analysis have been conducted to study the investment attractiveness, ensuring the active investment activity and some positive decisions have been made. Conditions of the efficient socio-economic development in the region level has been clarified and analysis of the basis of possible ways of direct investments to the regions, characteristic features of the active investment activity for investment attractiveness and the modern approaches for efficient socio-economic development of regions have been conducted. Efficient ways of focusing the investment opportunities emerged in the country on the socio-economic development of the regions have been investigated and scientific-theoretical problems of the encouragement of the investments to the regions in modern condition have been analyzed. Influence of the non-stable financing, unidentified strategy on implementation of the socio-economic projects funded by the government of Azerbaijan republic has been described, execution of the actions against global political and economic influences, the international currency, traditional competitive environment in business have been analyzed. Socio-economic analysis of these problems plays economic justification for execution of the external and internal investments, the capacity of the budget and grants for resolution of these problems. Besides that development of the tendency of increasement of the amount of the fund required to increase the investment resources needed for socio-economic development of regions and the processes on this direction have been analyzed. The importance of the correctness of the data gained to use given complex and systematic methods and necessity of researching the events focused on implementation of the regional investment projects in Azerbaijan Republic according to the current investment policy has been justified. Some proposals have been given considering the local features, learning the experiences of the other countries in regional perspective, the same time the necessity of elimination of the current problems and the aim of the analyses has been identified. These proposals will help to increase the efficiency of this process for implementation of the promising priority projects. Regional business development, the amendment or improvement of the legislation for application of investments in country being more compromising has been investigated in the analysis.

Keywords: *investment, investment attractiveness, region, socio-economic development*

1. INTRODUCTION

State-run management of certain natural resources historically in the socio-economic space of Azerbaijan reasonably increases the economic efficiency and activity of the socio-economic policy. From this perspective, certain differences between regions, emergence and grows of crisis situations in economy requires more agile actions from market participants. Recently the reforms conducted in the country allowed getting positive results in development of the economy and social field. In the modern condition investments are considered to be one of the vital factors for the development of socio-economic system of every country. The scale, structure and efficiency of the investments identify mainly the status, perspectives and competitiveness of the national economy. Changes in the quantity of the investments has positive effect on the level of employment of population and social production, getting the structural changes in the national economical network, development of the economy and

industrial fields. The same time dynamics of the investments is the main parameter of the recycling process and it gives opportunity for allocation of resources for the current consumption and between the main relations for future growth.

2. APPLICATION OF THE INVESTMENTS FOR ENSURING THE SOCIO-ECONOMIC DEVELOPMENT

One of the main problems before the modern society is to intensify the improvement of the socio-economic condition and this requires creation of favorable conditions. To achieve these goals investments can be involved in the real section of economy. The amount of the investments in the main funds and their growth rate is the indicator of the investment attractiveness of the region. Increase in the attractiveness helps the flow of capital and in common, the restoration of the economy. From this perspective, guided by some certain features, allocating the investments to regions, reducing the investments' risk level and investment potential increases the investment attractiveness of the region. Mainly the successful activity of the regional administration bodies has got the vital importance in resolution of this matter. Experience shows that the efficient socio-economic activity of the regions, reasonable increase in the flow of investments to economy depend on the attractiveness of the investments in these regions. The scale of investments identifies the type of the recycling of the economy and these types can be a simple, large or restricted. In this case the main indicator is the net investment indicator. The total investment is the amount of finance invested for new building structures and for purchasing new production means for a period of time. If the total investment is more than amortization amount and as a result of that it reflects the positive value of the net investment, it means that in this case productivity is ensured (1. Pages 2-3). When the total investment and amortization is equal, it means that the substantial cost of the net investment is generated, and as different number of investment funds intervene in the economic life, recycling of the social product is generated and enlarges gradually. In the case when the total amortization cost is more than the total investment value, the net investment indicator should be accepted in the meaning of negative value. Decrease in their amount can lead to reduction of production potential and eventually in the economic recession (2. pages 60-61). It should be considered that it is impossible to apply any methodology to estimate the development of the region and assess the development level and for doing that, distinguishing factors of regions and social aspects of the development of business must be considered. Many macroeconomic indicators can be listed to characterize the effectiveness of the regional economy. From that list, the internal regional product, the external trade turnover, the level of investment, current level of life condition, unemployment, consumption prices, per capita amount of the medium monthly income of population, industrial production, production of agriculture and per capita housing supply in the region must be taken into account.

3. ASSESSMENT OF THE REGIONAL ECONOMY AND ATTRACTING THE INVESTMENTS

A unique approach can be applied for assessment of the regional economy. All these factors influence each other mutually, directly or indirectly, but statistics in this matter doesn't allow to assess the economic condition in the region widely. The indicator of the investment attractiveness must be emphasized for description of the economic efficiency of the region. This is the grade of the investment attractiveness and this is one of the conditions for investment activity and eventually it means the efficient socio-economic development of the regional economy. There are the main moments in assessment of the region's investment attractiveness and they can be various. Of course, each region has got investment attractiveness and it includes the current legislative basis, legal aspects, political situation, the level of defense of the rights

of investors, tax rate, etc. The main principles of the establishment of the regional investment policy are listed below:

1. Application of fast and related industrial investment projects,
2. Expansion of investment base for mortgage lending,
3. meeting the current requirements of the same conditions and the insurance system for all participants,
4. Establishment of the equal competition environment, insurance of the apparent activity of the investors and investment projects.

As a result of elimination of the negatively affecting aspects the profit level has been increased in regions and progressive development of social economic development is being observed. The level of socio-economic development is the main factor indicating the development level identified after the comprehensive assessment of the position of the region. Different social problems must be solved for increasing the level of social life and economic development in regions. To make the investments more attractive it is necessary to increase the strong development of economy, also having greater financial potential of the state as a whole is considered to be a positive factor (3. Page 13). Of course, another important task before the government is the control of investment market and full insurance of the apparent information policy. The start and development of the business for investor, provision of the best favorable conditions for making investments and increasing the competitiveness of the region are the main tasks of the regional economic policy (4. page 21).

4. ELIMINATION OF THE FACTORS AFFECTING IN THE DEVELOPMENT OF THE INVESTMENTS IN REGIONS

For development of the investment process in the regions of Azerbaijan Republic the below listed negative tendencies must be eliminated:

- Insurance of the future sustainability of the requirement for the competitive products in the commodity markets,
- Elimination of the low efficiency of the investments in local production,
- Expansion of the goods and paid services.

This is true that, there must be internal opportunities for these tendencies to bring to the dramatic changes and establishments of them must be executed gradually. The main restricting factors of development of the investment activity are listed below:

- Reasonable dependency of the national economy, public finance and payment balance on the conjuncture developing in the world commodity market,
- Not paid attention on internal and external needs of the economy,
- Limited development opportunities of economy of Azerbaijan due to low financial resources and reduction of the internal needs of the firms and companies focused on the domestic consumers,
- Lack of the progressive growth of the investment mechanisms, weak relations among the fields due to lack of capital,
- Low loan rating in the international capital markets which prevents efficient borrowing of the financial resources,
- Low real income and population savings which prevent the growth of the consumers' requirement.

Taking into account all of these, the main goals of the investment policy of the state can be summarized execution of the tasks as listed below:

1. Improvement of the investment environment and raising the attractiveness of the investment of the national economy up to maximum,
2. Restoration of the investment potential and wider development of the internal investment potentials of the country,
3. Reinforcement of the banking sector as an investment center and increasement of the investment activity up to the modern requirements of the loan and financial potentials,
4. Further development of the investment opportunities of fund market and institutional bodies,
5. Acceleration of the process of attraction of the investment resources and external capital from the world markets,
6. Raising the efficiency of investing activity of the state and improvement of the financing mechanisms according to the modern innovative requirements.

Of course, implementation of these actions and their efficient activity as a mechanism mean releasing of some part of the budget capital. The depressive and efficient restructuration must be implemented based on especially important projects implemented in industry. With this regard, resolution of problems of the social field merges in itself the mechanisms implemented by support of the state and in parallel, it is required to increase the amount of investments year by year in resolution of the social provision (cultural, educational, scientific and medical) and growth issues of population.

5. CONCLUSION

Considering the above-mentioned discussion, it can be concluded that the efficient regional investment policy must be based on below mentioned principles:

1. It is necessary to have the detailed legislative division of some responsibilities between the regional administrative bodies and municipal bodies. They use the economic condition in the regions of Azerbaijan and the advantages they have in some directions. For having more efficient control they must be given broader rights and accountabilities. On this basis, the long-term development program must be prepared on attraction of the foreign capital for ensuring the efficient distribution of the relevant economic sectors and linking the regional executive powers with the regional development programs. The main task of the local bodies needs to be taking advantage of the foreign capitals and projects giving opportunity for resolution of the regional problems, application of the discounted tax, establishing the profitable investment condition.
2. It is reasonable to centralize the functional control of investment processes by merging them in both central and regional level to achieve the efficient control of them.
3. The regional investment programs should include mainly the private, governmental and municipal, as well as the special projects intended to attract the foreign investments. The efficient resolution is possible by getting agreement around the projects executed by the participants of the regional investment program - production, socio-economic, organizational, economic, scientific-research, development and other activity sectors.

ABSTRACT

This paper presents quantitative analysis on inputs and outputs of primary education in 79 districts (LAU 1 level) in the Slovak Republic. The analysis considers a broad array of factors important for educational outcomes: the socio-economic status of the students, capacities of regional systems of education, volumes of financial support from national public and European resources, and the number of teachers per student, etc. The European resources are analysed by type of intervention ('hard' policy measures implemented under the Regional Operational Programme and 'soft' policy measures implemented under the Operational Programme Education). The analysis also considers data on the socio-economic background of students, and data on financial and non-financial inputs to primary education. Two dependent, and 15 independent variables are examined via factor and regression analysis. The explanatory power of the regression analysis was significantly higher for the drop-out rates than for the Test 9 scores. Poverty was by far the most important factor behind dropout high rates. The result indicates that once families pass the poverty threshold, student performance is more responsive to state funding. Further research may bring more details on the relationship between investment in social inclusion and formal education. The key conclusion from the analysis is that neither national public nor European funds alone are able to address problems around the issue of increasing drop-out rates. Regional distribution of the dropout rates is strongly correlated with the distribution of Roma communities, material deprivation, and unemployment. The state has to address problems of poverty and marginalisation first and then turn to policies of primary education. The policy recommendation is to implement complex local strategies, which address multiple problems in one policy package.

Keywords: *early school leavers, socio-economic background, student performance*

1. INTRODUCTION

1.1. Conceptualisation

There is a substantial return on human capital obtained via education (Badescu et al. 2011). A smooth transition from school to work is extremely important for students' future lives. Early school leavers ('dropouts') find it very difficult to find stable jobs. Jobseekers with incomplete primary education account for the highest unemployment rates. Completion of primary education is subject to many conditions, such as availability of educational infrastructure, dedicated teaching staff and public support and good quality curricula. Successful transition from school to work, however, is by no means guaranteed even in developed OECD countries. Students from families with low socio-economic status must cope with many difficulties when completing their studies. Poverty, ethnic and racial discrimination, and/or lack of motivation may induce students to leave education prematurely.

The academic research brings plenty of examples that the socioeconomic background of students plays an important role in learning performance and outcomes. A meta-analysis of 74 studies by Sirin (2005), pointed to a medium to strong correlation between socioeconomic status and student achievement. A meta-analysis of 66 studies by Çiftçi (2017) indicated that socioeconomic status has a high effect on student achievement. Lindo (2014) found a relationship between students' family background, (i.e. human, social and financial capital), and the comprehension of struggling readers in grades 2–6. Perreira et al. (2006: 511) found that low levels of family human capital, and community social capital, place the children at risk of dropping out. The socio-economic background impacts performance and literacy levels. Netten et al. (2014) show how the socioeconomic factors are related to the reading literacy achievement of fourth-grade children (about 10 years of age) in the Netherlands during the past decade. Students coming from disadvantaged backgrounds and/or marginalised communities may have found completion of compulsory education particularly challenging. Pasca (2014), for example, examined background and context of integration of the Roma population in and through education. There is little doubt that socio-economic background matters for student performance. We are still missing insight in specific transmission mechanisms between the socio-economic status of students and their performance. Thomson (2018) concludes that over the past 50 years 'we are fairly certain that socioeconomic background does have an effect on educational achievement, but we are no closer to understanding how this effect is transmitted'. The role of public funding in student performance is less clear. According to Card and Kruger (1996), the vast amount of research on the relationship between school resources and student outcomes show rather ambiguous results. Hanushek (2006, p. 865) notes little consistent relationship between resources allocated to schools and student achievement.

1.2. Trends in student performance in Slovakia

The Europe 2020 Strategy set five headline targets to achieve by the end of 2020. For education, the Slovak Republic set national targets in smart and inclusive growth: to reduce school dropout rates to below 6%. The target proved difficult to achieve. The school dropout rates (as a percentage of the population aged 18-24) increased from 6.0% to 9.3% in 2008-2017 (Eurostat 2018). Families with low socio-economic background generate significant share of early school leavers in Slovakia. Risky groups of students (coming from low-income/low-education families) constitute a major factor behind deteriorating performance of the Slovak Republic in primary education compared to the OECD averages.

Figure following on the next page

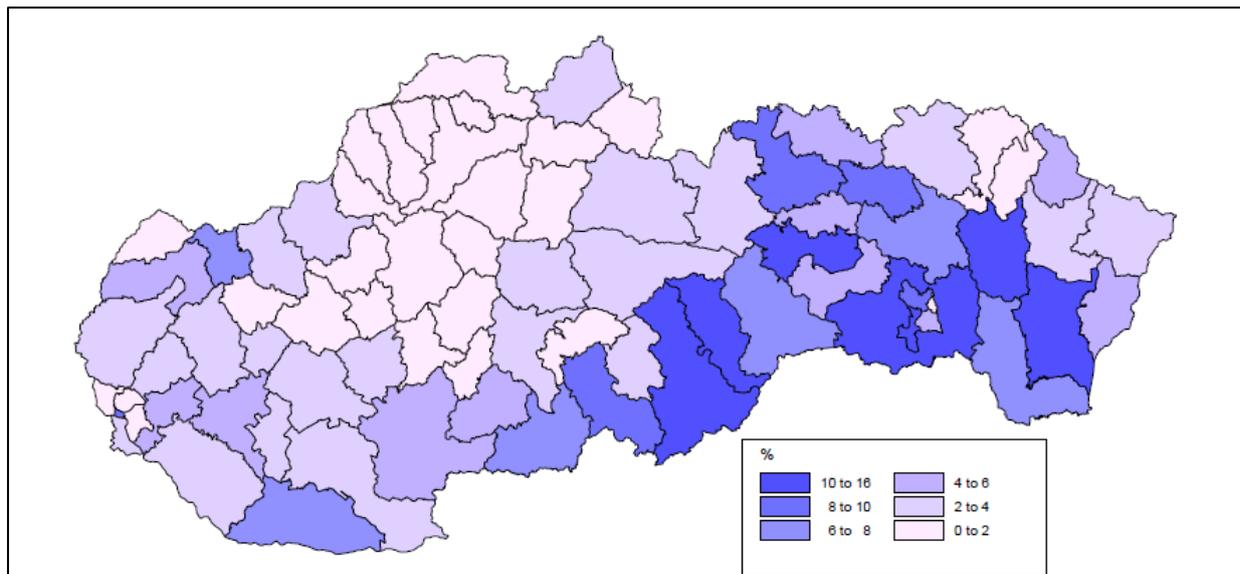

Figure 1: Early school leavers as % of population aged 18-24 years. Drop-out rates in primary schools for 15-years-old (%) (The Slovak Centre of Scientific and Technical Information, and authors' own computations).

The OECD PISA report (OECD 2014: 13) found that socio-economic disadvantage is closely connected with many of the student and school characteristics that are associated with performance. The OECD PISA analysis established the strongest relation between socio-economic status and educational outcomes for Slovakia, Hungary, Bulgaria, Uruguay and Chile. The same report also ranked Slovakia with countries where the school system segregates students according to their socio-economic status. There are no student-level data on socio-economic status of the Slovak students. The personal data, however, can be approximated via contextual information. Regional distribution of some important socio-economic variables (unemployment rates, population living in material deprivation, share of Roma population and share of population with the lower secondary attainment) is very similar to regional distribution of the dropout rates for primary schools. This paper presents quantitative analysis of student performance in primary education in 79 Slovak districts (LAU level 1, formerly NUTS level 4). The analysis examines a high number of variables important for student performance. The variables relate to the socio-economic background of regions, intensity of financial support from national public and European resources, and the numbers of teachers per student, etc. The European resources are analysed by type of intervention ('hard' policy measures implemented under the Regional Operational Programme and 'soft' policy measures implemented under the Operational Programme Education). We analyse performance of both early leavers and students completing primary education. Primary education constitutes nine years of schooling in Slovakia. An additional two years of schooling in secondary education is compulsory in Slovakia. Regional data on dropout from secondary schools were not available. We therefore compute the drop-out rates for nine years of primary education only. The strength of the relation between socio-economic background and inputs to education on the one hand, and educational outcomes on the other hand, is examined via regression analysis in the next chapters.

2. HYPOTHESES

The literature review and the OECD reports lead to the following hypotheses:

- H1: Public support is positively correlated with student performance
- H2: Socio-economic background is more important for student performance than public support

3. DATA SOURCES AND RESEARCH METHODS

3.1. Data sources

The central government agencies manage data on education finance and school performance. Data on school dropout rates were provided by the Slovak Centre of Scientific and Technical Information (SCSTI 2018). The National Institute for Certified Educational Measurements (NUCEM 2018) provided data on evaluation of 9th graders' performance ('Test 9'). Both institutions are agencies of the Ministry of Education, Science, Research and Sports of the Slovak Republic (MESRS). The SCSTI and NUCEM also provided data on numbers of students and teachers, and data on national financial support to primary schools. The Government Office manages the databases of the National Strategic Reference Framework. The databases provided data on the European support to primary schools. The data concerned 1080 projects (financed from the ROP and OPE) implemented until 2014. The Statistical Office of the Slovak Republic provides the DataCube database. The database contains context data on population structure, wages, educational attainment, urbanisation rates and divorce rates. The Central Office of Labour, Social Affairs and Family of the Slovak Republic (COLSAF 2018) provided data on unemployment rates and population in material deprivation.

3.2. Variables

Two dependent variables were chosen to analyse student performance:

1. Percentages of dropouts in primary schools.
2. Evaluation of 9th graders' performance ('Test 9') in reading in their mother language, and mathematics. The performance is measured via the Average Marks of School (AMS) and the Average Success Rate of School (ASR)¹. The OECD PISA (2014) study pointed to links between the students' mother language, language used in school and educational outcomes. Slovak, Hungarian and Ruthenian languages are used in Slovak schools. We considered the mother language of students when analysing AMS and ASR scores. In mixed-language schools (Slovak-Hungarian and Slovak-Ruthenian) the language of the majority of students was considered the language of the exam.

A number of independent variables impacted educational outcomes in Slovak primary schools. Some variables relate to the socio-economic situation of regions where students live and attend schools. Most important variables include average regional levels of educational attainment, employment and income levels, shares of urban population and shares of marginalised communities in the total population of the region. We also observe regional divorce to marriage ratios. Students coming from incomplete families may account for sub-optimal performance in primary education. Primary schools differ also by level of education inputs, such as financial assistance and numbers of teachers per student. The independent variables were allocated in two groups. Ten variables for the socio-economic status included

- Annual average unemployment rate (%).
- Annual average gross wage (euros).
- Share of Roma population in total population, as reported by the 2013 Atlas of the Roma Communities².
- Share of urban population in total population (%).
- Divorce to marriage ratio (number of divorces divided by numbers of marriages) (%).

¹ Slovak student performance is ranked on scale 1 = best to 5 = worst. Marks over 3 indicate poor performance. The ASR score indicates how many students passed the exam. Average national ASR was 54.7% for mathematics and 62.0% for reading literacy in 2014. Total number of schools involved in Test 9 was 1448, of which 1309 used Slovak, 124 Hungarian and 3 Ruthenian languages. Data on AMS and ASR are reported on levels of schools. This study uses weighted average data on all schools in particular districts (LAU 1 level).

² The 2011 Census data heavily underestimate numbers of Roma members. The 2013 Atlas of Roma Communities presents more realistic data on total numbers and regional distribution of the Roma community in Slovakia. Source: UNDP (2013).

- Share of population in material deprivation in the total population (%).
- Share of population with a primary education (ISCED 0-2) in age 35+ in total population aged 35+ (%).
- Share of population with the lower secondary education (ISCED 3c) aged 35+ in total population aged 35+ (%).
- Share of population with the upper secondary and postsecondary education (ISCED 3 and 4) aged 35+ in total population aged 35+ (%).
- Share of population with tertiary education (ISCED 5 and 6) aged 35+ in total population aged 35+ (%).

Three variables for education inputs included

- Numbers of students per full-time teacher in primary schools³.
- National public financial support per student in primary schools (euros).
- The European financial support per student in primary schools (euros).

The support was disaggregated for projects implemented under the Regional Operational Programme (ROP) and the Operational Programme Education (OPE). The OPE 1.1 and 4.1 Policy Measure supported development of soft skills by teachers and students. The OPE 3.1 Policy Measure targeted Roma students. The ROP projects supported infrastructure reconstruction and modernisation, and improvements in energy efficiency in Slovak schools. All dependent and independent variables were computed for the district level (LAU 1) in the periods 2011, 2012 and 2013.

3.3. Factor analysis

The social and economic research frequently copes with problem of multi-collinearity. Multi-collinearity is a statistical phenomenon, where two or more predictor variables in a multiple regression model are highly correlated, meaning that one can be linearly predicted from the others. We firstly computed simple correlations between dependent and independent variables. The correlation matrix indicated high correlations between shares of Roma population, unemployment rates, share of population in material deprivation, and share of population aged 35+ with primary education. High incidence of multi-collinearity may undermine results of the regression analysis. We found eight independent variables with correlation coefficients higher than 0.6 (and significant on the 0.05 level). The factor analysis alleviates problems with the multi-collinearity. Factor analysis helps by reducing high number of independent variables to a lower number of factors. The factor analysis reduced the above mentioned eight independent variables to three factors (Table 1):

- Factor 1 loads on shares of population in material deprivation, share of Roma population, unemployment rates and shares of population aged 35+ with primary education. The factor was labelled 'poverty'. It explained the highest share (41.79%) of the total variance in eight independent variables. The factor indicates high shares of population living in poverty in the district.
- Factor 2 accounts for high positive loading on shares of population aged 35+ with lower secondary education and high negative loading on population aged 35+ with tertiary education and in receipt of the average wage. The factor indicated high shares of working population with lower wages and lower secondary education in the district.

³ Slovak schools employ teachers on full-time and part-time contracts. Statistics on education report numbers of teachers on part-time contracts. Details on average volumes of the part-time contract however are not provided. Data on the full-time equivalents are not published. This analysis therefore took into account teachers on full-time contracts only.

The factor was labelled ‘lower-middle class’. It explained 34.67% of the total variance in eight independent variables.

- Factor 3 loaded only on one independent variable – share of population aged 35+ with upper secondary education. The factor indicates high shares of middle-income / middle – education population and was labelled ‘middle class’. It explained 12.94% of the total variance in eight independent variables.

All three factors explained 89.41% of the total variance in variables in factor analysis. The high explanation rate indicates significant mutual dependence of the variables under analysis. The Bartlett's test of sphericity and the Kaiser-Meyer-Olkin Measure of Sampling Adequacy, indicated good fit and reliability of the model (Table 1).

Table 2: The Factor Analysis

Factor	Factor 1 (poverty)	Factor 2 (lower-middle class)	Factor 3 (middle class)
Share of population in material deprivation, %	0.958	0.218	-0.064
Share of Roma population, %	0.960	0.014	-0.021
Unemployment rates, %	0.878	0.357	-0.081
Population 35+ with primary education, %	0.700	0.608	-0.118
Population 35+ with lower secondary education, %	-0.025	0.943	-0.123
Population 35+ with tertiary education, %	-0.282	-0.874	0.013
Average monthly wage, euros	-0.393	-0.758	-0.140
Population 35+ with upper secondary education, %	-0.096	-0.027	0.988

Notes: Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization. Rotation converged in 4 iterations. Kaiser-Meyer-Olkin Measure of Sampling Adequacy = 0.772. Bartlett's Test of Sphericity: Approx. Chi-Square = 1966.37; df = 45; Sig. = 0.000.

3.4. Regression analysis

Linear regression examines whether and by how much some independent variables (unemployment rates, financial inputs to education, etc.) impact a dependent variable (drop-out rates, success rate for the 9th graders in reading and math literacy). Parameters of the regression model were set to compute all significance levels higher than 0.05. The ‘backward’ type regression was used. The backward regression starts with all candidate variables, tests the deletion of each variable using a chosen model comparison criterion, deletes the variable (if any) that improves the model the most by being deleted, and repeats this process until no further improvement is possible. The linear regression employed (i) eight independent variables reduced to three factors (see previous chapter), and (ii) seven original variables (students per teacher, investments from national public and European resources per one student, divorce to marriage ratio and urban population rates). Table 2 report results of the linear regressions for primary schools in 79 Slovak districts. The table reports (a) values of the adjusted R squared and (b) values and significance levels for the standardised regression coefficients (*B*). The standardized regression coefficient enables comparison of importance by diverse independent variables (euros per student, teachers per student, divorce to marriage ratio in percent, share of Roma population in percent, etc.). Transformation of original regression coefficient to standard regression coefficients helps to tell which independent variable has higher impact on change in a dependent variable. Value of the *B* coefficient for variable ‘Poverty’ is 0.699 while the value of the *B* coefficient for variable ‘state funding per student; is 0.099 (Table 2). It indicates that poverty impacts the dependent variable (drop-out rates) much more than the state funding per student. Sign (+) or (–) indicates type of correlation.

The dependent variable is positively correlated with poverty ('the more poverty the more drop-outs') and negatively with 'lower-middle class' ('the higher share of lower-middle class the fewer drop-outs'). The significance level (*Sig.*) indicates whether an independent variable is a meaningful predictor of a dependent variable or not. The lower value of the *Sig.* the higher likelihood that an independent variable is a meaningful predictor of the dependent variable. In statistics *Sig.* value 0.05 is a common threshold. We applied the backward likelihood ratio type of regression. Only variables significant on the 0.05 were retained. Decrease in dropout rates ('early school leavers') below 6% is a key national target in field of education in Slovakia. The regression analysis generated best results to explain dropout rates in primary schools (Table 2). Six independent variables explained 61.1% of total variance between 79 Slovak districts in terms of dropout rates. The 'Poverty' variable accounted for the highest explanation power. The 'Poverty' variable is a factor score. The 'unemployment rates', 'material deprivation', 'primary education attainment' and 'share of Roma population' generated bulk of factor score for the 'Poverty' variable'. The highest dropout rates in primary schools (Figure 1) were found in underdeveloped districts in southern and eastern Slovakia (Revúca = 15.5%, Rimavská Sobota = 14.9%, Košice II = 14.6%, Michalovce = 13.7%, and Vranov nad Topľou = 11.1%). The 'lower-middle class' variable had negative correlation while the 'divorce to marriage ratio' positive correlation with the dropout rates. It means that higher regions with higher shares of the lower-middle class had lower shares of drop-outs. Regions with high divorce rates had higher drop-out rates. The numbers of students per teachers and state funding per student accounted for positive correlation with the dropout rates ('the more teachers and money the higher drop-out rates'). This rather counterintuitive result is explained by funding rules. Primary schools in poor regions use to have smaller classes, and higher numbers of teachers and higher relative funding than schools in developed urban areas. As for the European support, the regression analysis found that primary schools implementing projects under the OPE Policy Measures 1.1 and 4.1 achieved lower drop-out rates. We assumed that these projects had positive impacts on drop-out rates. These positive effects, however, were not able to compensate for impacts of socio-economic status of the students.

Table 3: Linear regression for primary schools in 79 Slovak districts (LAU 1) in 2011-2013

Dependent variable:	drop-outs (%)		Test 9 - AMS		Test 9 - AMS		Test 9 - ASR		Test 9 - ASR	
			Reading		Math		Reading		Math	
	<i>B</i>	<i>Sig</i>	<i>B</i>	<i>Sig</i>	<i>B</i>	<i>Sig</i>	<i>B</i>	<i>Sig</i>	<i>B</i>	<i>Sig</i>
Factor 1 (poverty)	0.699	0.000	0.210	0.003	0.378	0.000	-0.296	0.000	-0.288	0.000
Factor 2 (lower-middle class)	-0.119	0.030	0.288	0.000	0.304	0.000				
Factor 3 (middle class)										
Urban population, %							0.374	0.000	0.216	0.000
Divorce to marriage ratio, %	0.098	0.028			0.294	0.000	-0.201	0.001	-0.273	0.000
Students per teacher	0.164	0.001								
State funding per student (€)	0.099	0.019			-0.330	0.000	0.363	0.000		
ROP, € per student			-0.165	0.030						
OPE 1.1 / 4.1, € per student	-0.130	0.003								
OPE 3.1, € per student			0.218	0.002	0.178	0.011	-0.153	0.028	-0.196	0.003
Adjusted R²	0.611		0.186		0.232		0.230		0.308	

Notes: Only variables with significance levels 0.05 and lower are reported. The dependent variable 'drop-outs' is reported for mandatory education on primary schools only and is not compatible with the Eurostat indicator of drop-out rates for students in age group 18-24 years. State and European funding is in euros per student. AMS = average mark of a school; ASR = average success rate of a school.

The regression analysis explained lower shares of variance in educational outcomes in terms of average mark of schools (AMS) and average success rate of schools (ASR) in the Test 9 exercise. The regression explained 23.0% in total variance in ASR in reading and 30.8% in mathematics. 'Poverty' remained the most important explanatory variable for ASR in reading and maths (it also turned out to be important for explaining AMS). Districts with higher levels of poverty accounted for lower ARS in reading and mathematics. The ASRs in reading and mathematics were positively correlated with share of urban population and negatively with divorce to marriage ratio. Students from urban areas and/or complete families therefore performed better in maths and reading than students from rural areas and/or incomplete families in the Test 9 exercise. Projects supported from the OPE Policy Measure 3.1 targeted marginalised Roma communities and were implemented in districts with high incidence of poverty. It explains positive correlation of the OPE 3.1 projects with AMS and negative correlation with ASR. Most OPE 3.1 investments concentrated in districts of southern and eastern Slovakia (Revúca, Rimavská Sobota, Rožňava, Brezno, Gelnica, Brezno, Sabinov and Vranov nad Topľou). Signs of regression coefficients in fact indicate that the OPE 3.1 projects were well-targeted on an at risk group of students with poor educational performance. The OPE 3.1 projects accounted for quite low allocations and were not able to improve educational attainment of students in a short time. Total state support to primary schools was €1,797m and total European support (ROP and OPE projects) was €156m in period 2011-2013. European resources accounted for some 8.7% of the national public support. It however generated some positive results in educational outcomes of the Slovak students. The regression analysis indicated that the OPE 1.1 and 4.1 projects helped to decrease drop-out rates in Slovakia.

4. DISCUSSION, CONCLUSIONS AND DIRECTIONS FOR FURTHER RESEARCH

Problems with the student performance are closely correlated to problems of social inclusion in Slovakia. The explanatory power of the regression analysis was significantly higher for the drop-out rates than for the Test 9 scores. Poverty was by far the most important factor behind high rates of drop-outs. State funding accounted for much lower *B* coefficients. Poverty remained a very important factor in the Test 9 (AMS and ASR scores), but state funding per student seemed equally important. The result indicates that once families pass the poverty threshold, student performance is more receptive to the state funding. Further research may bring more details on the relationship between investment in social inclusion and formal education. The key conclusion from the analysis is that neither national public nor European funds alone are able to address problems with increasing drop-out rates. Regional distribution of the drop-out rates is strongly correlated with distribution of Roma communities, material deprivation, and unemployment. The state has to address problems with poverty and marginalisation first and then turn to policies of primary education. The policy recommendation is to implement complex local strategies, which address multiple problems in one policy package.

ABSTRACT

The paper introduces important aspects of doctoral research concerning innovation management in the context of business management challenges posed by digital transformation. The research was conducted as part of the Research Centre of Business Administration in The Bucharest University of Economic Studies, Romania. The study aims to identify and showcase key components of innovation management - with a primary focus on topics spurred by the recent wave of digital evolution. Against this background, the issue of smart city solutions makes for an interesting case – firstly, because it affects a large number of people and businesses around the globe and secondly, the complexity of the topic forces companies to pursue different innovation management approaches to successfully manage its associated challenges as well as opportunities. The paper consists of an overview on the existing literature and a concise outline of our research. Both research from professional associations as well as recognized publishers were considered. Furthermore, market data were gathered and processed. More than 50 publications were analyzed to better understand trends in digital transformation and its impact on innovation management. Our research revealed that in the light of the fundamental challenges posed by digitization, companies are required to take a structured approach towards their innovation management options. In the context of smart city solutions, the adoption of the “4I Solutions Model” enables businesses to choose the strategic option suitable to their individual case. In a nutshell, this framework includes four different approaches ranging from initiating groundwork innovation internally to establishing partnerships with selected external parties.

Keywords: *Innovation Management, Digital Transformation, Business Models, Smart Cities*

1. INTRODUCTION

Urbanization is a central topic across scientific disciplines against the background of more than 50% of the worldwide population living in urban areas. Until 2050, this number will double putting the existing, stressed city eco systems under additional pressure. The negative results are already visible around the globe with poorly-developed transportation systems, decaying infrastructure, insufficient affordable housing, inadequate energy supplies, poor social services, rising crime, overburdened healthcare systems or exhausted waste management capacities. The mounting challenges in combination with a high level of complexity due to the interconnectivity and interrelation of issues puts municipalities to a real test. On a positive note, companies with innovative solutions are able to benefit from by double bottom line by increasing profits and improving the living conditions of million people worldwide. Understanding the social, economic and technical implications of smart city solutions is the key for companies to unlock opportunities in this field. At the same time, the role of disruptive innovation is critical for companies to improve their competitive positions. Staying ahead of other market participants is closely associated with selecting the right innovation management strategies which are strongly influenced by the latest wave of digital transformation.

In this context, the presented research consists of an overview on the existing literature. Both research from professional associations as well as recognized publishers were considered. In order to provide for a holistic and balanced picture, more than 30 publications were analyzed to better understand trends in digital transformation and its impact on innovation management. The aim of this paper is to contribute towards the discussion on smart city solutions from a company perspective with a particular focus on innovation management approaches available (Dirks et al., 2009; 2017; Betis et al., 2018; Ross 2017).

2. CHARACTERISTICS OF DIGITAL TRANSFORMATION

The issue of digitization is often associated with optimizing business processes. In this context, automation and standardization are key components in the hunt for improved efficiency in any given business. Essentially, it centers on the question of implementing leaner and cost-efficient processes and procedures. By taking these measures, businesses strive towards improving their market position, while firms lacking the skills or motivation to innovate their ways of doing business tend to find themselves at the back of the pack. As a matter of fact, digitization efforts are often perceived as cumbersome and require significant resources, but the rewards in the form of better customer centric operations and easier scalability should be taken into account. One of the perceived advantages of digitization is access to business and market data, which can be processed and utilized for improving strategic decision making. In the light of a VUCA business environment, a sophisticated data management system can become an important factor for future success. Therefore, firms tend to focus on holistic software options as a means for underpinning their digitization efforts. All in all, firms have been confronted with those challenges for more than 20 years. Surprisingly though, only a limited number of businesses has been capable of successfully implementing standardized and automated processes. According to research conducted by MIT, roughly 1 in 4 established firms has fully digitized their internal procedures and processes. This is particularly alarming given that digitization efforts are regarded as a first step towards achieving the merits of turning digital transformation into new business opportunities (Markovitch & Willmott, 2014; Nandram & Bindlish, 2017; Ross, 2017). Against the background of digital transformation, businesses face substantial challenges with technological development such as cloud computing, internet of things and artificial intelligence resetting the rules of the game in business. Given the multitude of topics raining down on companies, they sometimes have difficulties in seeing through this complexity. Additionally, adjusting ways of doing business under these circumstances can be challenging for individual market players who have been settling on a rent-seeking modus for an extended period of time. Digital transformation turns markets and their players upside down with the rules of supply and demand being redefined. As a consequence the power dynamics between firms and customers is shifted, leaving businesses with open issues in the field of creating new value propositions for their clients, attracting digital savvy talent, building and maintaining a culture of sharing and caring among others. In a nutshell, digital transformation goes far beyond building a new app. It comes down to implementing a new way of doing business (Schallmo et al., 2016; Ross, 2017; Newman, 2018; Richards, 2018). In order to facilitate the digital transformation journey, Futurum Research (2018) publishes an annual digital transformation index to outline the most essential impact factors for internally driving developments and changes to embrace the dawning digital era. In this context, figure 1 underlines the importance of technological partnerships, in combination with a supportive company culture including management assistance as well a group of skilled employees. This essentially summarizes the backbone of digital savvy company embracing change and innovation.

Figure following on the next page

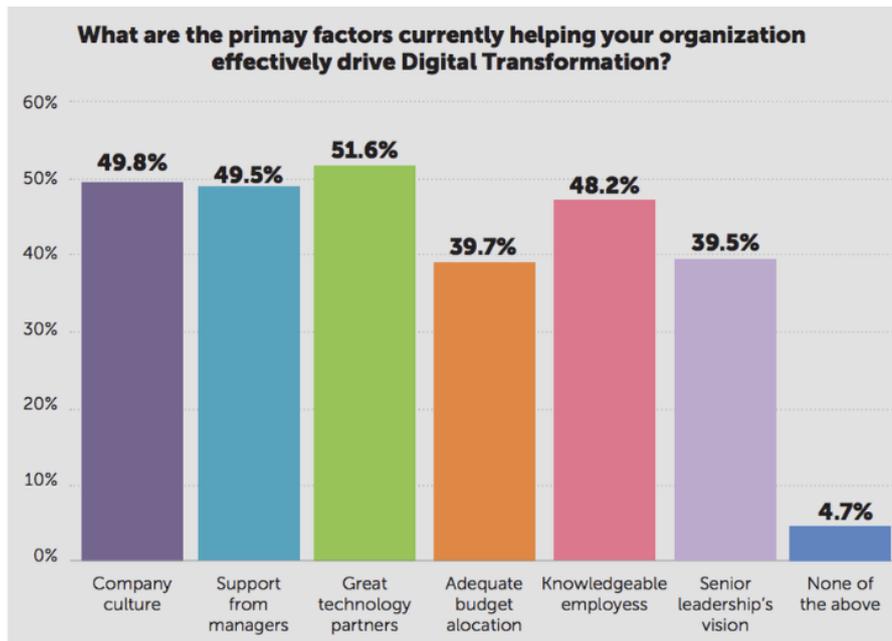

Figure 1: Internal drivers of Digital Transformation (Newman, D., 2018. 2018 Digital Transformation Trends: Where Are We Now?, Forbes: 20 August 2018, Retrieved 3 January 2019 from: <https://www.forbes.com/sites/danielnewman/2018/08/20/2018-digital-transformation-trends-where-are-we-now/#5ce36efbc647>)

3. IMPACT OF DIGITAL TRANSFORMATION ON BUSINESS OPERATIONS AND MANAGEMENT

Digital transformation changes the fundamentals of doing business by disrupting business models across the globe. While this is not evenly distributed across the planet, Hirt and Willmott (2014) have identified a set of distinct driving forces. Those seven elements impact on traditional business operations and allow firms to reconsider their strategic options going forward:

1. New competitors enter the stage:

Companies have been taking rent-seeking position often protected through insurmountable entry barriers. Given the rapid development of internet services, digital market participants have been enabled to break into formerly impenetrable territory. At the back of refined management approaches, technical skills and talented employees, those firms put pressure on the current champions. AirBnb has successfully disrupted the hospitality industry without owning a single accommodation, while direct bank ING Germany has made the case of attracting millions of clients without a single branch. The next step of this digital trend is that successful firms use their brand value to venture into other fields of business as showcased by Apple launching its payment service in a growing number of countries (Handelsblatt, 2018).

2. Prices and margins come under pressure:

Customers are no longer caught in a weaker position against companies thanks to a drive towards greater transparency triggered by the internet. Firstly, the number of products and services has increased substantially, giving customers additional choice. Secondly, an abundance of testing and review websites allow buyers to see through flashy marketing and advertisements straight through the actual value of available goods. This helps bringing prices for end-customers down, while at the same time firms face pressure on prices and margins. Given regional differences in digital sophistication, this however might not be case in all countries.

3. Customer behavior triggers a winner takes it all dynamic:

The development associated with digitization fuels a customer log-in dynamic that allows web-based champions to profit from superior management skills in combination with state of the art organizational set-ups. This generates additional business and works as a vital tool in the fight for talent. Customers perceive these firms as desirable and choose them as go-to places, creating a virtuous circle of success breeding new success. (Grab et al., 2018a)

4. The invention of plug-and-play business models:

Against the background of individual champions being able to take it all, there is a question to what extent smaller competitors are capable of securing their share of the digital pie. The answer is fairly simple since smaller niche players are able to use the existing platform structure of market heavyweights to reach out to clients. In this way, both sides benefit from this business relationship. While bigger businesses expand the product or service range to be offered to their clients, smaller players serve customers in a familiar and secure platform environment. (Schallmo et al., 2016)

5. Fierce fight for the right talent:

In the light of dramatic changes expected in the labor market of the future, mainly because of phenomena such as the use of robotics and artificial intelligence, companies need to revisit their HR and recruiting strategies to come up with winning staffing plans. Given that Frey & Osborne (2013) underline that 1 in 2 professions could be replaced by machines affecting both blue and white collar jobs, companies will have to decide on jobs to be made redundant. On the other hand, specialized profiles might be even more difficult to come by given the expected fight for talent. (Manyika et al., 2017; Nedelkosa & Quintini, 2018)

6. Convergence of global supply and demand:

Online retailers have conquered the globe. While this might differ from region to region of the world, the growth of e-commerce is significant. Against the background of this rise in online retailing, customers expect a harmonized experience across borders. This includes the entire value chain from product selection over delivery to payment options and customer support services.

7. Constantly evolving business models:

Digital transformation has no finishing line that companies can reach with the aim of securing their position in the market. It is rather a gradual process which sees different waves of digital evolution. Therefore, successful companies build adaptable and resistant organizations capable of evolving swiftly based on a customer-centric approach. Business models are continuously changed, adapted and developed to stay on top of their competition. The hospitality and tourism industry provides for an interesting case in this context with market players such as TripAdvisor and booking.com being at the forefront of broadening their client and revenue base through new products and services. (Schallmo et al., 2016)

4. INNOVATION MANAGEMENT IN THE DIGITAL ERA

With relentlessly involving business models becoming an imperative of the digital era, the demand for innovation management can be regarded as a factor of strategic importance. (Maier et al., 2013; Maier et al., 2014; Kiehne & Olaru, 2017). In this context, firms need to find a middle way between incremental development and disruptive change or as March (1991) pointed out – between exploration and exploitation. Both strategic options require employees with different skills, different tools and overall a different team or company culture. Further, they offer a deviant risk and return profile with exploratory ventures often being eyed as overly

bold and risky. Figure 2 showcases that misbalance between the number of exploitation projects perceived in companies and the actual rewards generated by exploratory projects. The latter allows firms to turn their disruptive ideas into real profits. (Kahn, 2012)

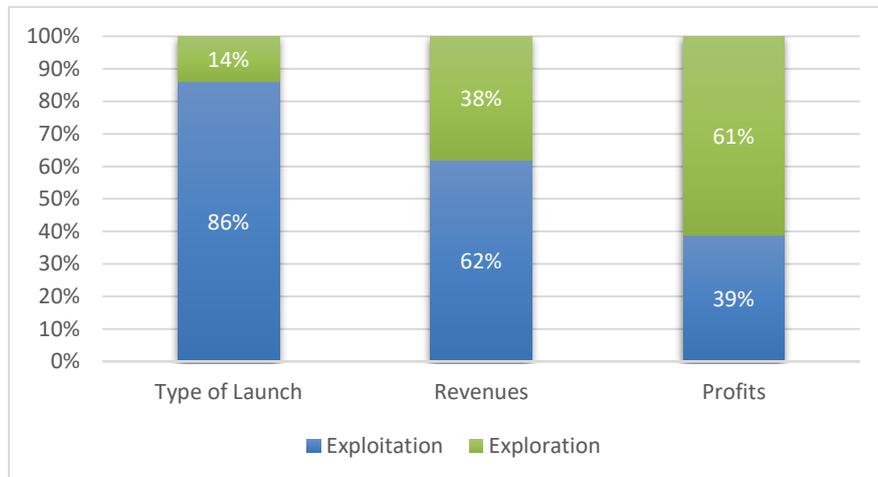

Figure 2: Spread and benefit of innovation types (Kahn, K., 2012. *The PDMA Handbook of New Product Development*, Chichester: Wiley)

5. A POSSIBLE SOLUTION TO OVERCOME INNOVATION OBSTACLES IN THE CONTEXT OF SMART CITIES DIGITAL TRANSFORMATION

5.1. What is smart cities?

Cities around the globe have a strong attraction to a growing number of people. At this point roughly 50 percent of the World's population lives in urban settings. With this trend not expected to lose momentum in the years to come, the number of people living in cities is projected to double by the year 2050. Such substantial congregations of people come at a price which is showcased by some of negative phenomena associated with urbanization: Under or poorly-developed transportation systems, decaying infrastructure, insufficient affordable housing, inadequate energy supplies, poor social services, rising crime, overburdened healthcare systems or exhausted waste management capacities (Johnson, 2008; Marceau, 2008; Dirks et al., 2009; Betis et al., 2018). In the light of these overwhelming challenges, there is a broad consensus that incremental innovation and improvements of urban living will not be sufficient to reach crucial overarching targets such as quality of life or sustainability. With this in mind, more drastic and holistic changes are required spanning across numerous sciences and disciplines. Essentially, smart city is a disruptive innovation approach that focuses on a forward-looking city, as defined by Giffinger et al. (2008). Harrison et al. (2010) complements this forward-looking nature of smart cities by a strong IT dimension using an intelligent flow of collected and processed data with the aim of a smart and interconnected urban area. In general terms, this urban area connects the existing physical infrastructure in the form of buildings, roads and energy lines, the IT infrastructure both tangible and intangible, the social infrastructure, and lastly the diverse business infrastructure to reap the benefits of the joint smart thinking in a given city. A view shared by various other scholars, including Washburn et al. (2010) as well as Kanter and Lintow (2009). The use of numerous new technologies is at the core of smart city solutions. Given the multitude of technological advancements, it includes such diverse disciplines as computer science, architecture, electrical engineering, business management, social science or medicine. The effective deployment and integration of these disciplines shall lead to creating more safe, secure, sustainable and inclusive urban areas, which could then be labelled smart (Betis et al., 2018).

5.2. What are the main challenges from a company perspective?

A smart city is a field of business that allows companies to benefit from a rising demand across various disciplines. At the same, the degree of interconnectivity and complexity is what makes superior management skills essential in the context of this topic. In their integrated study, Chourabi et al. (2012) defined eight individual factors of influence to be considered for designing and implementing smart city solutions:

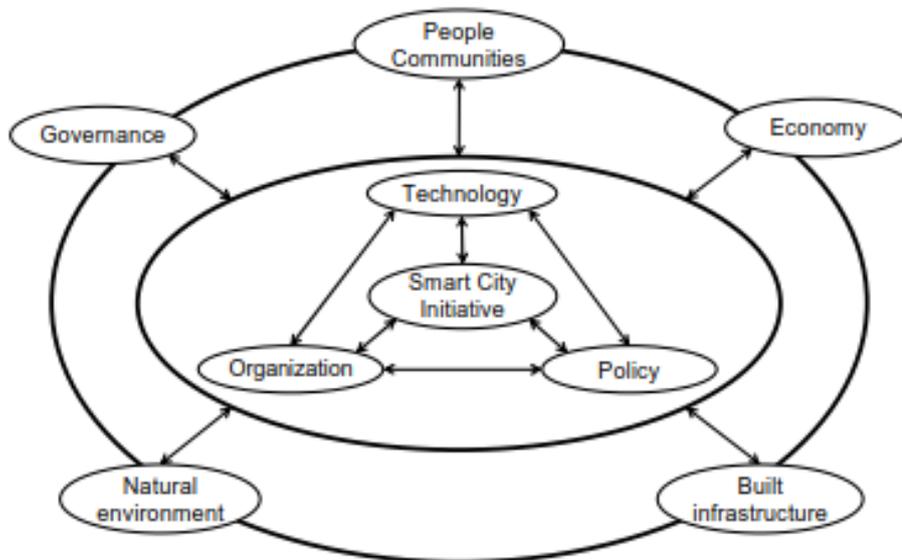

Figure 3: Smart City Initiatives Framework (Chourabi, H. et al. (2012). *Understanding Smart Cities: An Integrative Framework*. 45th Hawaii International Conference on System Sciences. 2289-2297. 10.1109/HICSS.2012.615.)

As part of this framework, a holistic approach towards smart cities is taken, providing a profound understanding of the individual elements to be considered. Essentially, it highlights that various challenges are indeed more of an organizational or social dimension rather than being strictly of a technical nature, which could be addressed by either digital innovation or ramping up investments in people, gadgets or infrastructure. This translates into the requirements for managing stakeholders, understanding interfaces, potentially competing interests and values as well as the full scale of social and political complexity. In this light, smart city solutions may require companies aiming to secure their share of the business pie to opt for the right strategic options when it comes to market their disruptive products within a challenging context (Grab et al., 2018b).

5.3. A possible framework for innovation management in the context of smart cities digital transformation

In the background of the innovation challenge faced by companies interested in benefiting from rising demand for smart city solutions, the issue of drafting, selecting and pursuing the right strategic option is essential. In this context, current research in combination with expert opinions and market observations point towards four widely used approaches allowing firms to innovate in the field of smart cities in accordance with their individual capabilities and need. In this context, the adoption of the »4I Solutions Model« enables businesses to choose the strategic option suitable to their individual case. In a nutshell, this framework includes four different approaches ranging from initiating groundwork innovation internally to establishing partnerships with selected external parties.

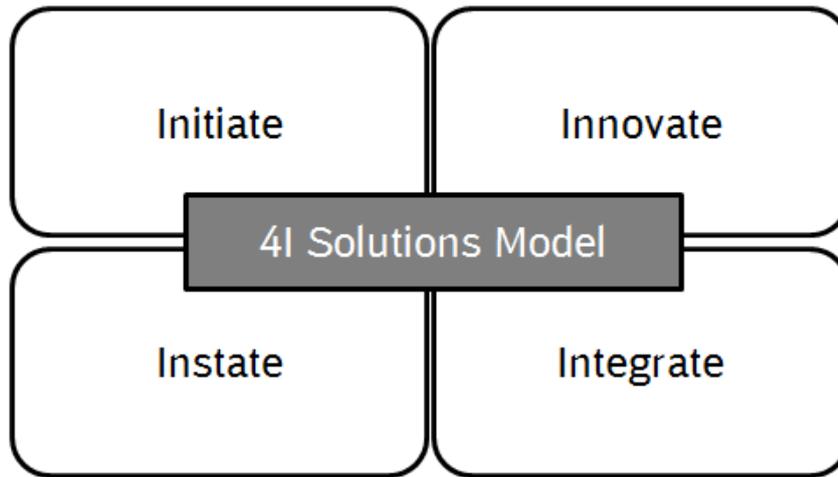

Figure 4: "4I Solutions Model" for Innovation Management in the context of Smart Cities Digital Transformation (own illustration)

1. Initiate:

Firms have the option to start new innovation efforts in the field of smart city internally. This may require significant ramp-up costs given the scope of the solution targeted by the firm - the larger the foreseen investment, the higher the probability that only large corporations are capable of initiating such investments. In this context, those types of companies have the opportunity to cover a wider range of smart city topics with additional capacities and skills in integrating products. Not surprisingly, companies with strong capabilities across various industries such as General Electric rank very highly in smart city indexes such as the Compass Intelligence A-List Index. In contrast to globally active corporations, start-up companies also play an important role in triggering innovation with regards to individual solutions within the wider smart city framework. Given their customer-centric approaches, combined with lean structures and adaptive business models, those firms are in the position to swiftly initiate new smart city: flying car pioneer Lilium or waste management firm NordSense are just two examples of the vast and diverse start-up scene contributing to innovation for future urbanization.

2. Innovate:

Another option concerning innovation management in the field of smart city solutions is the pooling, integration and extension of internal capacities with the aim of creating market-ready products and services. In this regard, firms focus on building on top of existing resources and capabilities. Experience and knowledge can be leveraged, in order to lower costs associated with starting from scratch. At the same time, the structured process of integrating and developing existing batches may form new disruptive ideas.

3. Instate:

Given the complexity of the smart city universe, firms can choose to utilize their existing network to complement products and services with new value propositions developed in other parts of the group or partner network. Thus, reducing costs associated with innovation management while covering a much broader scope of the smart city landscape. Transport providers such as German railway company Deutsche Bahn are therefore able – through a network of subsidiaries - to combine different innovation approaches in autonomous driving, intelligent transport and traffic management with last mile solutions to give customers a more integrated and holistic product and service experience (Meyer, 2017).

4. Integrate:

While tapping on internal resources and skills is often perceived as the favorite while most cost-effective option regarding innovation management, firms may find themselves in a situation where integrating external resources and skills are considered to be a superior alternative. Depending on the strategic plans of a firm, acquiring ideas and resources may fast track the road towards becoming a significant player in the field of smart city solutions. Verizon's take-over of IoT specialist Sensity is just one example of a major corporation acquiring technical expertise in growth field to catapult themselves towards the front of technological advancements associated with smart city solutions. (Maddox, 2016; Grab et al., 2018c)

6. CONCLUSION

As outlined throughout the paper, companies are faced with substantial challenges in the context of digital transformation. In order to stay ahead of the competition, they are forced to innovate continuously with a strong focus on disruptive solutions creating real customer value. In this context, an increase in revenues may offset the tendency towards tighter profit margin. For companies addressing challenges in the field of smart city solutions, the awareness of the level of complexity and the multitude of facets is important. Thus, it will determine the strategic options and shape the innovation management suitable to any given organization. Going forward, additional research will be required to put the desk study results of this paper to a practical test. In addition to that, smart city solutions are expected to evolve in the years to come providing ample opportunities for further scientific groundwork both on a macro as well on a company level.

THE ROLE OF THE BUSINESS IN THE PROVISION OF SUSTAINABLE SOCIO-ECONOMIC DEVELOPMENT

Aliyev Mahammad

Azerbaijan State University of Economics, Azerbaijan
m.aliyev@unec.edu.az

ABSTRACT

In the article, the role of business in ensuring sustainable social and economic development and the idea of the concept of corporate social responsibility in large companies are analyzed not only by standard commercial and financial indicators. The broader request of the public and its potential sustainability, as well as compliance with business development, has been studied. The possibility of solving the problems of sustainable development of society in the context of contradictions between the tasks of economic, ecological and social development has been studied. The importance of developing a more progressive theory of development and existing opportunities for using the concept of corporate social responsibility to address the social and economic problems of the regions was underscored. In the article the current status of the concept of corporate social responsibility and ways of its adaptation to the conditions of the Republic of Azerbaijan are considered. In the existing political and economic pressure condition the importance of ensuring the state security and mainly the security in the economic field increases day by day in Azerbaijan Republic. Given the fact that economic security is the large-scale concept based on some principles (developed socio-economic system, ensuring the sustainability of the national economy etc.) we can observe that several internal and external factors highly affecting on the economic security of a state. From this perspective the role of business for ensuring the economic security and sustainable socio-economic development is that it facilitates the influence of the firm and companies on development of socio-economic development and the stability of the national economy. Business activity of the firm and companies on sustainable socio-economic development is important on the development of the state's economic system and maintaining of the employment of people, meeting the needs of people by goods (services, jobs), taking part in creating a competitive environment and forming the existing budgets are important subjects and they have been discussed in this paper. In this paper approaches analysis of the author for business concept on ensuring of socio-economic development are introduced, the important role of the business for socio-economic development is described, socio-economic development dynamics of the business is researched, and problems of business experienced on this way are investigated.

Keywords: *concept of social responsibility, priorities of sustainable development, the scope of business opportunities*

1. INTRODUCTION

In the context of contradictions between modern economic, environmental and social development goals, the provision of sustainable development for the society is very important. In order to provide strong social development (economic, environmental and social), it is necessary to build a strong relationships between all aspects of business and to identify priorities for achieving goals set. The concept of CSR, which is already formed in the world, is still not being used efficiently in the business world of Azerbaijan. Though the concept of corporate sustainable development have been widely accepted in the world, social responsibility criteria is not correctly applied in Azerbaijan, and both government and population do not approach business in a right way. In the domestic practice, the implementation of the CSR concept requires the transformation, taking into account the characteristics of transformation, the mentality of the population, public perceptions, and the peculiarities of the organization of the

economy in different regions. It includes ways of environmental regulation based on economic activity, and particular ecological conditions of some regions that have a controversial impact on socio-economic development. On the one hand, it is necessary to preserve unique natural conditions, through restricting the development of industry near certain territorial units. On the other hand, a new sustainable economic development course, focused on tourism development and direct use of natural resources, can have a positive impact on the environment and the living standards of the population.

2. THE REGIONAL SOCIAL AND ECONOMIC PROBLEMS

It is important to determine the more progressive development theories and available capabilities for usage of the corporate social responsibility concept to address the social and economic problems of the regions. Determination of sustainable development priorities requires the consideration of the need for modern economic practice, that is, the importance of corporate social responsibility. In order to achieve targets based on economic mechanisms that choose the objectives of sustainable socio-economic development, it is necessary to prioritize and select the right direction. Elimination of the existing contradictions and solving problems on the basis of mutual responsibility at any level is the requirement of the modern era. In the modern period, there are certain companies that are dealing with the development of theoretical background of the sustainable development, and these companies must act in that direction. The current status of the Corporate Social Responsibility Concept and the ways of co-ordinate the activities of companies operating in the Republic of Azerbaijan with this concept should be analyzed and studied. In recent years, the attention of scientists has been focused on the solution of both national and regional levels of sustainable development and corporate social responsibility. However, we stay on the opinion that, the aspects of the corporate social responsibility theory should be reflected in practical life. As it is quite difficult to define priorities, the responsibility and the role of business increases in ensuring the sustainable development of the society. As a result, the concept of Corporate Social Responsibility (CSR) increases not only the standard commercial and financial performance, but also the broader public interest and sustainable development requirements, the business development, and the actual problem of the day [1.p.159-160]. In particular, it is important to study the possibilities of regional business in solving these problems in modern scientific literature. There are numerous publications of academicians and professionals across the world dedicated to the theory of sustainable socio-economic development and corporate social responsibility. Undoubtedly, there is no systematic approach to the scientific debate, which is based on the sustainable development of the economy. The concept of transition from a particular region, based on relevant normative-legal acts. All these problems should be solved using modern methods of empirical and theoretical research, economic and statistical analysis.

3. THE PRINCIPLES OF THE CORPORATE SOCIAL RESPONSIBILITY

Addressing socio-economic development of the Republic of Azerbaijan based on social responsibility should be disclosed in the context of scientific approaches. Observations and analysis show that the business should be characterized by the current state of social responsibility, so that the definition of social, business, financial and social responsibilities should be defined in a single approach. In line with the objectives of sustainable socio-economic development, it is important to prepare a package of proposals for the development of social responsibility of businesses, which is the actual problem of the day. In modern conditions, clarification of the corporate social responsibility principles should be based on existing approaches to the analysis of business, business ethics, stakeholders, corporate sustainability, corporate approach and sustainable development concepts. From this point of view, the existing contradiction between economic, social and environmental development goals should be

identified based on the analysis of the socio-economic development of a particular region. [3.p.45.72]. According to the obtained analysis, the process of regulation of economic development in the Republic of Azerbaijan on the basis of modern requirements makes necessary the local authorities to set requirements in this aspect in accordance with certain conditions and possibilities in order to activate companies' social responsibilities. As apart of modern social behavior priorities, it is important to direct the possible common interests of the state and business within social responsibility and to establish mutually sustainable and efficient mechanisms for the solution of social problems. The perspective directions of the social programs of the Azerbaijani companies, which have been considered in the context of sustainable development, can contribute to the effective implementation of their business strategies. From the aforementioned, it can be concluded that there is a contrast between the economic, ecological and social development, due to the contradictions between the production of goods or services, the environmental protection and the desire to maximize the quality of the social environment. One of the main objectives of sustainable development is to find innovative solutions to the problems that arise. Such a decision can be regarded as the application of socially responsible business behavior models. The concept of corporate social responsibility, business ethics, stakeholder understanding, corporate sustainability, corporate citizenship concepts can be incorporated here in the context of social responsibility behavior models and related concepts analysis. The analysis of these concepts enables each concept to complement each other in the process of evolution. The categories, integration, development trajectory need to be coordinated and properly managed as a single concept. The concept emerged as a result of corporate social responsibility integration must allow to measure us not only as economic instrument, but also as social and environmental aspects of life. [4.p.31].

4. THE WORLD EXPERIENCE OF THE CORPORATE SOCIAL RESPONSIBILITY PROBLEM

It is more effective to take into account the peculiarities of transformation changes at the regional level in the world practice of the corporate social responsibility, taking into account the peculiarities of the organization of the economy in specific regions. The socially responsible behavior of big companies (the social and economic problems of the country, the effective use of the budget) in the conditions of the Republic of Azerbaijan lead to the indisputable benefits to the society, the reduction of market failures and the creation of more controversial business environment. Modern business is not only an economic entity, but also an active participant in provision of social change that takes part in shaping of cooperation mechanisms with charities, non-profit organizations and government agencies. It means transition from traditional charity to strategic social responsibility behavior [5.p.87]. The stakeholders involved in the development of social responsible behaviours of companies operating in Azerbaijan should consider businesses in three blocks while studying external and internal relationships. That is, from the perspective of formation of the database of resources, availability of budget for social expenditures and allocation of funds for environmental protection and so on. Combining the business processes based on the various social programs implemented through appropriate economic mechanisms, can act as the main practical tool for regional development as a whole. There must be special requirements to create favorable conditions for people who are expecting a further improvement in the socio-economic situation. The measures and methods to be implemented in this direction should be identified. Necessity of business activity to solve social problems arising at the modern stage of successful sustainable development of the country is undeniable. In this regard, the role and functions of the state should be expanded fundamentally.

5. CONCLUSION

All above discussed analysis bring to the conclusion that, studying the theoretical and practical aspects of the level of assessment by engaging employees in social and environmental projects by providing sustainable development in a certain region is not in the right direction to develop. These requirements are urgently needed to study key corporate social responsibility issues in sustainable regional development. These requirements can be listed as mentioned below:

1. Theoretical approaches to the development concept should be systematized to understand the concept of sustainable socio-economic development and corporate social responsibility;
2. Identify ethical issues, corporate sustainability, and issues that are of interest to citizens at corporate level, justified by corporate social responsibility and relevant incomprehensible concepts;
3. To analyze socio-economic development of the region to identify problems;
4. To accelerate socio-economic development of the Republic of Azerbaijan, social sustainability and behaviors of the companies must be analyzed through increasing social responsibility in companies;
5. In order to ensure sustainable development of the Republic of Azerbaijan, it is necessary to formulate basic recommendations for the development of social responsibility of the business.

ABSTRACT

Modern business environment is very dynamic, unpredictable, turbulent, characterized by: a shorter life cycle of products or services, with expressive competition on a global scale, transition of society from an industrial to a society in which knowledge is treated like a critical resource in the economy, volatility of the market and economic conditions. Constantly impose new challenges that the management of a modern organization faces to achieve effective and efficient operations, which makes the manager's job more complex and dynamic, in constant struggle to rich the business position and to improve it. Only those businesses companies that are willing to promote innovation, change and continuously working on improving the quality of its products and services know what success is. Otherwise, their existence can seriously be in questione. Those companies that are not willing to innovate, will hardly be able to keep up with the global competition. Nowadays, in new circumstances the consumers in time, where their information are more accessible than ever, have a wide choice and the possibility to decide what is most acceptable to them. Crude market conditions do not forgive errors. Essential is to learning and to innovate in the modern business environment and it can not be only a privilege of management, but it must become obligation and needs of all employees. Organizations expected of employees that innovate becomes a state of their consciousness and aware of its usefulness in the way that every day do something for their environment and for their economic subject. By investing in employee skills, the company will indirectly invest in improving their products and services.

1. INTRODUCTION

In order for human society to develop, it is necessary to constantly improve, modify both material and intangible environment, such as changing people's awareness of it, overcoming factors that influence growth, progression. Innovation management is a wide process that encompasses the full spectrum of activities and measures that need to be applied to allow the idea to be translated into business value. This process can be applied to all kinds of ideas, whether it's products, processes, or services. Managing innovations is a wide process that involves the whole spectrum of activities and measures that need to be applied to enable the idea to be translated into business value. This process can be applied to all kinds of ideas, whether it's a product, a process, or a service. The main goal of Innovation Management is to provide a set of tools and tools that can provide inventors and creators with ideas to respond to challenges throughout the whole process and transform their ideas into innovations in the marketplace. The subject of this approach on the topic of "Innovation management" refers to the research and presentation of concrete facts about innovations in terms of concept, trends and phases of innovating innovation. The subject of work is innovation as a key factor in acquiring and maintaining a competitive advantage on the market.

One competitive advantage is to learn and to change. By changing their knowledge, employees change their attitude toward work and indirectly improve their products and services. In the literature, there are different approaches for determining this phenomenon, ranging from the mere observation of innovation as a technological phenomenon and at the end of innovation as a process, a set of activities leading from the idea to its commercialization. What can be concluded is that innovation is a key factor in achieving and maintaining the competitive advantage of a modern organization as a condition of its successful business. Considering that innovation and innovation in today's time are linked to the success of the company, therefore, great attention is being paid to this area within each company. The main goal of dealing with the topic of Innovation Management is to show how all the measures, tools and skills are used by a business entity, so that it can provide relevant solutions to all the challenges throughout the whole innovative process, in order to turn their ideas into innovations in the market, which will be able to survive and / or make progress. Managing innovation is the main direction and necessity of modern business. A key role in this is the strategic management of a modern organization, because the challenges of the environment need to be adequately addressed in order to achieve the set goals in the market. The structure of the work is visible from the content, so it can be said that the content structure of the work consists of an introductory part, in which we touch the subject, the goal and the structure of the access work, then we are conceptually familiar with the topic. In the second part where the importance of innovation and innovation in today's environment where the definition and concepts of innovation and innovation, the classification of innovation, the role of innovation strategy, innovation management, the definition of the scope of innovation, networking with innovations, then what are the stages in innovation management. In the third part of the ad hoc working paper, the latest information on trends in the field of innovations is described, it describes innovations in the Republic of Serbia, as well as innovations in the environment and countries in the region of Europe. The fifth part of the ad hoc work contains conclusions about the topic addressed, and the last sixth part contains the professional literature and sources used for processing the topic of access work.

2. THE IMPORTANCE OF INNOVATION AND INNOVATION INTO THE DATA ENVIRONMENT

The business environment is very variable and as such has a big impact on the company itself and thus their survival. The constant struggle of the company's owners with its management personnel to find adequate solutions for better adaptation to the turbulent environment. One of the most important rules for adapting the enterprise to a turbulent business environment is investing in innovation, which gives an advantage to the market in relation to other competitors. Very important innovations for the business of the company, and to see this in the next part, we will address: the definition of innovation and concepts of innovation, classification and division of innovations, role of innovation strategy, innovation management, definition of scope of innovation - strategic coverage, innovation pace management, networking with innovations, innovation management phases.

2.1. Definition of innovation and concept of innovation

In view of the fact that the importance of innovation is increasing, that is, the fight of those who are studying their studies and the greater the connection, today in professional literature can meet a large number of different definitions of the notion of innovation. We can say that there is no precise definition of innovation and innovation. Innovation can be defined as a set of activities undertaken by the enterprise, which are the source of new products or production processes. Enterprise development is mainly related to the existence of innovations. Innovation is the commercialization of a new idea, or its translation into a specific product, process or service.

Innovation is something that relates to the notion of an entrepreneur who seeks to foresee changes, reacts to them and accepts a high level of risk, and uses it as an opportunity in his business. But in spite of that, large companies are precisely those who have the ability and the necessary financial means to carry out innovations. It is a process that, as with any other process, is necessary to manage the right way. There is an expression of the role of managers at all levels and their ability to balance and optimize all of the innovative activities in the company. "Everything is flowing, everything is changing, only changes are constant", is a metaphor that completely reflects the modern business conditions. In previous times, business strategies have been defined and implemented most often in a reactive way in relation to processes in the environment, but also within the organizations themselves. Today, most organizations act proactively, that is, they notice possible events before their formation and react to them. Adaptation to numerous and varied changes, growth of competitiveness and continuous improvement of performance are the basic condition for the survival and success of modern companies. Initiation of the innovation theory first of all, we are associating for the name of J. Schumpeter, who in the first half of the last century marked innovation as the basic factor for achieving technological and economic development. He most often thought of replacing old technology with new technology, which he described as a creative destruction. According to the aforementioned author, innovation signifies the pimple of new technological knowledge, as well as market knowledge, with the goal of putting porters at the disposal of the products and services they want. Also, most authors believe that innovation is primarily related to technology and that they are mostly realized in this field, ie, today we can talk about technological innovations. New technology, as a result of innovation, results in the emergence of new business branches and firms. Technological changes play a very important role in the competitive dynamics. The changes they bring may have several outcomes (Stošić, 2007):

- Bring new products and processes with you;
- Change the value of the chain and the value of the company's constellation;
- Change the nature of rivalry between firms.

According to the OECD, innovation is the adoption of something new or significantly improved product, service or processed new marketing methods or new organizational methods in business, job creation ... Innovation must be a constant corporate activity because those who do not innovate are unsuccessful and disappear forever, by Preser and the Branch. We look at innovation as applying new knowledge to have new products or services that consumers will want for themselves. Throughout this process, innovation is just the initial step where a good idea is to be applied so that investment becomes an innovation. Innovation is never viewed as a separate event, but it is a whole series of activities that together make the process, and for the execution of the procedure only good management is needed. We can conclude that there are different definitions, but all of them lead to the same that they are activities that are different from those that were previously used. Four things are important for successful innovation (Jagaš, 2009, p.9):

1. New - something that previously did not exist or was created by a combination of available resources in a new original way,
2. Better - introducing something new just because it's new and existing, it does not make any sense and most often carries more damage than the benefits,
3. Needed - there must be a need to solve a problem or develop a new product or service,
4. Economically justified - in order to fulfill its purpose, the company must achieve direct or indirect benefits from innovation.

2.2. Classification and division of innovations

There are different classifications of innovations depending on the criteria applied. Below you will see three classifications of innovation (Krstić, Gavrić, Skorup, 2018, p.134)). According to the character or nature of innovation they are divided into (Krstić, Skorup, 2011):

- Social (social) - include the introduction of newspapers within the framework of the socio-political system and include: market (marketing) innovations; innovation in the field of governance (which improves productivity, product quality and usability, and the quality of work); political innovations (measures taken by the state, legislative measures) and institutional innovations (new state institutions establishing with the goal of providing or performing social services or functions).
- Social-technological innovations represent a set of innovations generated and gathered around a single centric product (eg, a personal computer, a series of social innovations challenging it).
- Technological innovations - basically have new technological advancements. These include product and service innovation and process innovation.

According to the relative importance in the innovation process of innovation are divided into:

- Incremental - means adjustments, improvements and improvements to existing products and services, they are predominantly represented in the modification of products and processes, and relate to the rapid embedding of customers' demands in the concept of products and processes.
- Radical innovations - imply the introduction of brand new products and services and / or processes in the lead entity. In small business entities, they arise as a result of the owners 'or managers' debts, and in the case of large ones, they result from investing in the complete innovation space of the product, and they are larger in scope, while in small ones it is more effective, as there is a significant reduction in costs, which enables competitiveness in the market.

According to the field of application innovations are divided into:

1. Innovations in the field of strategy - introduction innovations in the organizational strategy;
2. Innovations in the field of technology - introduction innovations in the process of manufacturing;
3. Innovation in Product & services - introduction of new product or service or improving an existing one
4. Innovations in the structure of business - the introduction of innovations in the organizational subject which may be related to a hierarchy of authority, objectives, the structural characteristics and administrative procedures.
5. Innovation in Organizational Culture (employees) - is the change in the attitudes, beliefs, and perception of the behaviors of employees. The goal of this innovation is organizational effectiveness.

Changes in one part can produce changes in the second part of the subject. The new product can cause changes in technology, which in turn may require new qualified people, a strategy or a new organizational structure.

2.3. The role of innovation strategy

Knowing the organizational strategy is very important for innovation, because it achieves various advantages such as increased interest of the client, then easier overcoming competition, starting new forms of business, etc.

In order to develop innovative potential, the company needs to apply the appropriate strategy. The company must choose between two strategies (Bevanda, Živaljević, Bulut, 2015):

1. Leadership in Innovation - where the goal of the company is to be the first in the market and based on technological leadership, requires strong affection for creativity and risk taking ,
2. An innovation advocate - companies aim to put off the market, based on the empowerment of technology leaders, demand strong commitment to competition analysis, knowledge of reverse engineering, cost reduction.

3. MANAGING INNOVATION

Innovation is a process that takes place in stages. It begins with an idea that is new, and when an idea develops, it becomes a proposal. Innovation arises when the proposal becomes a reality and only then can one speak of innovation right. Since the idea has been formed and its realization has been completed, it is a complex process, so it is logical to expect that without a conscious management of this process, large deviations can occur which can lead to the failure of the idea. It is therefore important to know the pace and stages of innovation development. Regarding the pace of innovation, it should be emphasized that the characteristic of modern times is an increase in the number of innovations and a shortening of the time of their application in practice. "It is so, for example, until 1914 for the transfer of knowledge from discovery to production took 50 years, between 1920 and 1940 for this transfer took 16 years, after 1945 the time was shortened to 9 years, and since 1972 it is only 7 years with the tendency of further reduction (Buble, Klepić, 2009, p.92).

3.1. Defining the scope of innovation - a strategic envelope

In order to prevent economic operators from spreading innovative efforts towards uncertain innovative projects or projects that go beyond the domain and interests of the parent, it is necessary to define a strategic envelope, scope of innovation. Focusing on technology, or acquiring skills and expertise in a particular technical field, is one of the ways to determine which projects to work for. Businesses must precisely determine what kind of innovation they are looking for and what to expect. It is not necessary to create systems approach when assessing potential results and to learn from their innovative initiatives.

3.2. Managing the pace of innovation

In addition to the need to define the scope of innovation, it is also necessary to define the pace of innovation. In incremental innovative projects, business entities are quite rigorously managing the deadlines and goals, and the time required for this type of projects ranges from 6 months to 2 years. While more radical innovations are needed for more than 10 years, they begin with a long-term research period with an unknown outcome, and that rigorous deadlines and goals are unrealistic, often. Managing the pace and rhythm in the innovation process can be an important condition, a factor for achieving survival and long-term success.

3.3. Networking with innovations

We already mentioned that information, skills and knowledge are important for innovation. In practice, it is simply impossible for a business entity to have all the information within the organization and all the knowledge necessary to carry out an innovative process from the idea to its commercialization. It is therefore important to turn to networking for innovation. Networking for Innovation is establishing cooperation with partners that can help us in the realization of innovations, that is, all those who can provide us with all that knowledge and skills that we do not have, which are necessary for the success of an innovative process.

Partners in an innovative project can be:

- other employees within the unit organization,
- employed in the same economic entity, but in different organizational units,
- other economic entities.

Partners can also be from other environments such as university research centers and active regional, national and international innovation stakeholders. In the process of selecting a partner, business entities must develop specific mechanisms; in deciding on the choice of partners, the key criteria are: »the rhythm and scope of innovative initiatives, the type of expertise needed by the business entity and from which partner it can obtain, the contribution of partners in innovation, how the revenue will be shared and who will claim the intellectual property right«.

4. PHASE OF INNOVATION MANAGEMENT

A strategic approach is very important to every company that seeks to innovate in its business. A strategic approach involves certain phases, that is:

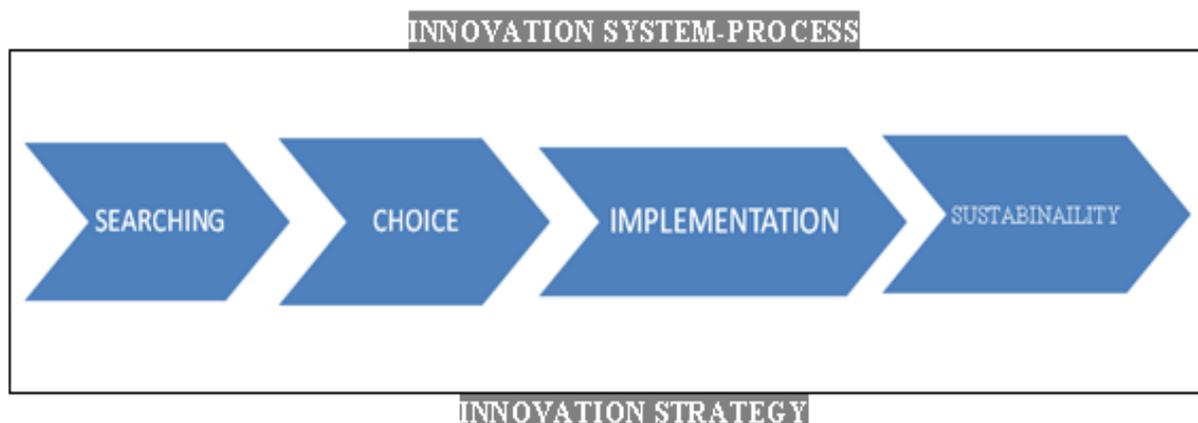

Figure 1: A strategic approach to creating an innovative company (Buntak, Droždek i Čovran, 2015)

- The first phase - search - its main feature is to look for an opportunity to innovate something.
- The second phase - the choice - where it is determined what exactly will be done.
- The third phase - implementation - determines how something will be done and
- Fourth phase - sustainability - the stage in which an answer is sought as a constant benefit will be achieved.

These four phases constitute a strategic approach to the creation of an innovative enterprise, where both the innovation system and the innovation strategy play an important role. There are also certain stages in managing innovation. Innovations can be managed through the following phases (Buntak, Droždek, Čovran, 2015, p.105):

- Scan and search the environment to collect and process signals about potential innovations,
- Strategically choose from a large number of potential innovations those that could achieve the greatest success,
- To provide resources, buy new technology and know how to use them,
- Implementing innovation, upgrading ideas up to the final realization,
- Considering all previous stages and analyzing success and failure in order to learn how to better manage the process and knowledge we have gained.

The stages of innovation management can also be divided in the following way (Krstić, 2012, p. 185):

- The first phase - Assessment of the current situation; The first phase is preceded by a NULL phase - called preparatory (team selection, timetable, defining results and identification of major problems) - the first phase - which is tasked with precisely and realistically determining what the current state of the company is. This stage determines the position of the company in relation to innovation management in relation to other companies, the determination of problems and recommendations to overcome this problem.
- The second phase - Defining the future situation; Some of the activities at this stage are: development of implementation and action plan, creating an image of an innovation system, drafting of rules, suggestion of improvement, etc.
- The third phase – Implementation; Phase that ends innovation management. The activities at this stage are:
 - introducing all employees with an innovation system,
 - creating an innovation leader from selected company managers,
 - support and application of technology in the innovation system,
 - inclusion in the system and the client and the supplier.

The key benefits of the implemented innovation system are:

- increased loyalty of employees, associates, partners,
- growth of motivation of employees and their performances,
- systematic finding of responses to the intentions and demands of customers,
- better utilization of own resources.
- improving the quality of products and services.

All the stages of innovation management are interconnected and dependent on each other, and the activity to be applied depends on the activity of the company, the characteristics of the company, and its possibilities on the market.

5. INFORMATION ON TRENDS IN THE FIELD OF INNOVATION

In today's world, different trends, types of trends are evidenced by many research, and one of the trends is innovation. Only the area of innovation is very susceptible to the impact of different trends that vary from country to country. Different trends are present in the countries in the region, in countries from Europe and our country.

5.1. Innovation in the Republic of Serbia

In an era of accelerated technological development, innovation activities are crucial for a stable knowledge-driven economy. Serbia understood this on time and, in 2011, launched the "Innovation Fund" to promote innovation in the fields of science and technology. The key component of the Fund is the "Innovation Support Project in Serbia", which aims to strengthen the capacity of innovation activities; the project was launched in 2011, financed by the European Union from pre-accession funds. The project encourages innovative entrepreneurship and improves innovation activity in Serbia, which is crucial for long-term economic growth. In addition to providing the necessary funds, several "training companies" were organized which brought the grant beneficiaries closer to the consultants from the Investment Fund and to foreign experts in order to discuss together the best ways for the development and commercialization of innovative products and services. Serbia has a lot of potential for innovation in all areas of life and should be oriented in that direction to improve business, announced the panel on the end of the Innovation Support Program in Serbia, which was implemented by the Innovation Fund with the support of the EU and the World Bank.

The four-year Innovation Support Program in Serbia, aimed at fostering innovative entrepreneurship in order to improve the competitiveness of the entrepreneurial sector and long-term prospects for Serbia's growth, as well as to raise awareness of technological development and innovation in the economy. One of the biggest problems encountered by the economy in Serbia, Companies wanting to innovate are primarily financial constraints, human resource constraints in terms of availability to quality researchers. Modern business conditions are characterized by strong competition, so it is increasingly difficult to get revenue, while costs are getting bigger. Bank loans are expensive for micro small and medium enterprises in Serbia because they generally have small capital and profit, which they can not provide assistance from the bank.

5.2. Indicators of innovative activities 2014-2016 in the Republic of Serbia

The data shown in the release number 197 of 20.07.2017. The Republic Institute for Statistics, represent the result of the research on innovative activities in business entities in the period 2014-2016. years. The survey was conducted on a sample of 3,587 business subjects. In the research, innovative business entities are defined as business entities that in the observed period introduced the innovation of products or processes, innovation in the organization or marketing. The results of the survey showed that the participation of business entities with at least one of the mentioned types of innovations is 41.2%. The key factor for the innovative activities of a particular business entity is the size of that entity. Two of the three big business entities are innovative, slightly more than half of medium-sized businesses, while small business entities are slightly more than 38%. Innovative activities are more prominent among business entities engaged in production, where almost half of the subjects were introduced, while less than 40% of business entities introduced innovation in service activities (<http://www.stat.gov.rs/sr-Latn/oblasti/nauka-tehnologija-i-inovacije/inovacije30.11.2018>).

Table 1: Business subjects towards innovation, activity and size (Republic Institute of Statistics, Republic of Serbia, 2017)

	In total	Inovators	Businesses that did not innovate	Participation innovators (%)
In total	16957	6994	9963	41,2
Small business subjects	14174	5417	8757	38,2
Medium business subjects	2257	1228	1030	54,4
Big business subejcts	526	349	177	66,3
Production business subjects	4723	2232	2492	47,3
Service business subjects	12233	4762	7472	38,9

Regarding regional representation, product / service innovation has the largest share and are equally represented in regions, so more than a quarter of business entities introduced a new product or service. Regional representation of innovations in organization and marketing ranges from 20.9% to 25%, while process innovations represent from 17.4% to 25%.

- Business subjects by type of innovation and business sectors; The participation of business entities of innovators in organization and marketing amounts to 30.2% and is less than the innovator of products and processes, where every third business entity is an innovator. These two innovation groups mostly occur simultaneously in business entities. Representation of business entities, who simultaneously introduced innovation of products and processes and innovations in organization and marketing, accounted for 22.4%. The largest representation of business entities of innovators is in the processing industry and in professional, scientific, technical and innovation activities.

- Share in total revenue from product / service innovation; In the income structure of the business entities of the innovators, the share of income from sales of unchanged or negligible slightly changed products is dominant, accounting for 32%. The share of the sales of products / services that are new to the business entity and the participation in the sale of products / services that are new to the market totals around 15%. Financial assistance from state instances (financial support in the form of tax credits, grants, subsidized loans or loan guarantees) received 12.5% of business entities - innovators.
- The market of selling products or services; The most numerous are business entities selling products / services on the local-regional market, followed by those who sell on the national market. The share of innovators in relation to non-innovators on the EU market, EFTA is twice as high, while in the markets of other countries it is slightly higher.
- Expenses for innovative activities; Expenses for innovative activities include investments in the development of new products, investments in the introduction of a new product on the market, funds aimed at significantly improving existing products, services or processes, as well as funds for innovation projects that have not yet been completed. Expenses for innovative activities include current expenditures (salaries, equipment, materials, services, etc.), as well as investment expenditures. The share of costs for the procurement of machinery, equipment and software is over 71% and represents the largest share of total expenditures for innovative activities of business entities.
- Significance of factors that were an obstacle to innovation activities; For most business entities, which are not innovators, 77% of them had no reason for innovative activities, while 23% needed them, but did not innovate because of too many obstacles. As the biggest obstacles to innovative activities, business entities assessed the lack of their own financial resources for innovation and too high innovation costs <http://www.stat.gov.rs/sr-Latn/oblasti/nauka-tehnologija-iinovacije/inovacije>)

Table2: Significance of factors that were an obstacle to innovation activities (Republic Institute of Statistics, Republic of Serbia, Press Release, 2017).

Factors	Importance			
	High	Middle	Small	Inappreciable
Lack of financial resources for innovation	14,6	4,4	2,9	78,1
Lack of credit lines and private capital for innovation	8,0	7,6	4,0	80,3
Prohibitive costs of innovatio	12,6	5,4	3,4	78,5
Lack of qualified personnel in a business entity	5,3	7,4	5,3	81,9
Lack of partners for cooperation	5,5	7,2	5,5	81,9
Difficulty for obtaining government grants and subsidies for innovation	9,5	4,6	5,3	80,5
Uncertain demand in the market for your innovative ideas	6,7	6,8	5,0	81,6
Too much competition in your market	7,0	6,8	5,0	81,3
Legislation / regulations are burdensome	7,1	6,7	5,5	80,8
Legislation / regulations that create uncertainty	7,6	6,6	4,7	81,1
Legislation / Regulations not consistent across the EU	5,0	5,1	6,0	83,9

6. INNOVATION IN COUNTRIES IN THE REGION AND IN EUROPE

In countries in an environment such as Croatia, Slovenia can be said to be an emphasis on the innovation of small and medium enterprises. In Slovenia, small and medium-sized enterprises introduce innovations in order to maintain the level of competitiveness or to raise the existing level even further. In Slovenia, innovation is mostly represented in products, while innovation in services has a much smaller share. When it comes to innovations, special progress in the Republic of Croatia occurred after 2003 when it began with certain research in this area. Earlier, it was considered that innovation was an essential part of the company's business, but it was much less. In today's business environment, company owners, together with employees, are becoming more aware that innovation is a turning point that is essential to survive on the market, but innovations are seen as a milestone for growth and enterprise development. In the Republic of Croatia, "a new or significantly improved product or service was introduced by 13.9% of enterprises, while 15.9% of the enterprises introduced the process innovation. Innovative companies that have parallel product innovation and process innovation are more characteristic of manufacturing companies than for service companies. Large enterprises often have 14 parallel product innovation and process innovation (40.6%) than medium, large (17.0%) or small enterprises (7.6%) (Institute of Statistics, Republic of Croatia, 2014, p.1.). Innovation activities include all scientific, technological, organizational, financial and commercial steps that aim to lead to the introduction of innovation. Procurement of plant, equipment, software and buildings is the most common form of innovation activities for most product and process innovators (80.8%), which are equally implemented by production and service companies. Manufacturing companies are more inclined to their own research and development activities and design activities, while service companies are more inclined to acquire different forms of knowledge on the market such as know-how, copyrighted works, patented and non-patented inventions of another type knowledge. Management has to constantly listen to market pulses, first of all thinking of innovation demands (Figar, 2007). One of the biggest obstacles to the market realization of innovation is the lack of money, although innovators are skilled and it will be able to overcome if they know where they can find the means for their promotion. Cyprus has the highest level of innovation, while Spain has a level of innovation. New products are quickly introduced by Cyprus, England and Italy. While Spain, Lithuania and Greece are among the countries that introduce new products the slowest.

7. CONCLUSION

On the basis of everything exposed, it can be pointed that innovation appears as a necessity of today. Large oranges to survive in a turbulent bubble must constantly innovate their products, processes and services, in the knowledge of their employees. Innovation can be interpreted as a process in which product improvement is necessary to achieve an increase in the production of the same product. In this process, the creation of completely new production methods, as well as purchasing and distribution, there are changes in the management, but also in the working conditions of the employees. In order for the entire process to be successfully carried out, it is necessary to base all of its efforts on mutual cooperation. Today, companies apply different types of innovations. Regardless of the type of innovation applied, it must be the key to growth and development of the company, but at the same time it will be the power that will drive the economy of any country in the world. Since competition is growing, both in the domestic and foreign markets of the company have recognized the importance of applying different types of innovations. Innovations have an important knowledge of the organizational strategy, because in this way different advantages are achieved, such as the increase in client interaction, easier competition, starting new forms of business, and more. In order to create innovation potential in companies, it is necessary to apply the appropriate strategy. The realization of innovations must be carried out in a very organized manner, and with the constant

supervision of the management in charge of innovation. He must control the process, evaluate, correct the mistakes he finds himself on the road. All organizations today should strive for an innovative organization, which is flexible, creative, provides the opportunity to participate in decision-making and the opportunity for individuals to prove themselves in organizations. Every organization in modern conditions must be an organization that learns this continuously, and which has special mechanisms and tools for applying its knowledge in business. In today's business environment, company owners, together with employees, are becoming more and more aware that innovation is a turning point that is essential for the market to survive, but innovations are seen as a turning point for the growth and development of the company. Firms that do not innovate, quickly decay or disappear from the market. Even small companies must do their best to avoid being deleted by big giants. The strategies it will apply will depend on the size of the organization, their activities, the goals of business, mission, vision. There is a wide range of strategies, but the essence is to adapt to current developments in the environment, as only companies that succeed in it can expect a positive result in the long run.

ABSTRACT

One of the millennium development goal i.e. Improve maternal health is chosen to examine the impact of microfinance in the presence of political stability as a moderating variable. Microfinance is measured with respect to three monetary dimensions and two non monetary dimensions. To investigate impact of growth in microfinance, microfinance index is developed by using principle component analysis and then panel regression models i.e. fixed effect and random effect models are applied. Data of 41 countries from 2000 to 2012 is analyzed to investigate impact of microfinance on maternal health. The research concluded that with growth in microfinance maternal health improves. The study will be helpful for policy makers to design strategies to achieve millennium development goals.

Keywords: *Microfinance, Maternal Health, Millennium Development Goals*

1. INTRODUCTION

Microfinance is lending small loans to poor. In microfinance usually the amount of loan lent is less and the transaction cost of small loan is not that much different from the transaction cost of large loan. High interest rates are justified due to high transaction costs incurred by MFIs. Also both loans require almost same monitoring time and paper work to process the loans. So cost of lending smaller amount is higher as compared to lending larger amount. Mallick (2012) found another weakness of lending small amounts as it will force the borrowers to borrow from money lenders as well, to fulfill their working capital requirements which will give an opportunity to Money lenders to charge high interest rates from these clients. Microfinance Banks also face greater default risk (Dowla, 2012) on loans as compared to commercial banks which also adds up to the total cost incurred by MFIs. Schreiner (2001) argues that large size of loan affect lenders. On one hand it represents the maximum possible loss due to default. Also larger loans have larger variable costs because of extra care taken by lenders due to greater risk exposure. Furthermore in case of large size of loan, microfinance clients may use the loan in non-constructing activities. Mostly microfinance institutions charged high interest rates from the borrowers as compared to commercial banks. To maintain their position they argued that poor need loan, not cheap loan so the offering of loan is considered as sufficient for the poor. On the way to further support their stance they argued that the risk of default on loans, in micro financial institutions is more as compared to commercial banks because commercial banks use monetary collateral whereas as most of microfinance institutions rely on social collaterals. As a result the poor are charged with high interest rates whereas rich are charged with low interest rates, which have weakened the fundamental objective of microfinance institutions. Charging poor with higher interest rates have created a situation of social injustice and inequality in a society (Sama, 2013). This may be more relevant for developing and emerging economies where most of the population is poor and socially bonded. For them the social collateral may also be of very much importance and this fact may lead to less default risk. So it is unjust to charge high interest rates from the poor having less default risk. In the presence of this trend it may not be possible to achieve millennium development goals as set by United Nations.

In addition to that the unstable political situation of the country may also be a hindrance to achieve these goals. Although we found wide literature in the field of microfinance for different regions of the world including Bangladesh (Kabeer, Mahmud, & Castro, 2012), India (Imai, Arun, & Annim, 2010), Nepal (Bhatta, 2001), Latin America (Goldmark, 2001), Bolivia (Maldonado & Lez-Vega, 2008), Bosnia and Herzegovina (Hartarska & Nadolnyak, 2008) but it is difficult to find a study in which microfinance is studied with respect to developing and emerging economies as a whole. As context always matter, accordingly the political state in one country may be different from that of the other country. As the study will cover numerous microfinance institutions from several countries in different regions of the world including Africa, East Asia & Pacific, Eastern Europe and Central Asia, Latin America & Caribbean, Middle East & North Africa and South Asia which also include countries like China, India, Bangladesh, Pakistan, Brazil, Mexico etc representing a greater proportion of the world population so in veracity the study covers whole of the world.

2. LITERATURE REVIEW

Millennium Development Goals set by United Nations have stimulated the development community to work hard for the improvement of the needy people. Different NGO's and donor agencies are positioning themselves to attain the MDGs by reducing poverty, empower women, to get rid of different infectious diseases, to improve maternal health, to reduce infant's mortality rates and to educate children. All of these objectives cannot be gained without any financial help. Consequently microfinance is used for this purpose. The impact of microfinance is not just limited to business loans but poor household also used microfinance for their health, education, as well as to encounter some household emergencies (Zeller & Sharma, 2000 ; Marincionia, Appiotti, Pusceddu, & Byrne, 2013). Access to microfinance also improves food supply (Kendo, 2013), which translates into better health but literature (Hennink & McFarland, 2013 ; Kar, 2013a ; MacGarty, 2013) is divided on the issue that microfinance has achieved millennium development goals, especially commercially oriented microfinance institutions. Usually poor people and especially women are prone to infectious, long lasting and communicable diseases in developing countries (Geissler and Leatherman, 2015). This risk increases when a woman undergoes maternity because of unclean and corroded equipment used in operating a delivery. The unskilled midwives further increase the risk to infant and maternal health. Although microfinance is not designed to improve maternal health but economic as well as social poverty go side by side and should be handled at the same time (Mohindra and Haddad, 2005). A bidirectional relationship between poverty and ill health is found in the literature (Marmot, Friel, Bell, Houweling, & Taylor, 2008). It is argued that ill health causes additional impoverishment which affects the potential of people to improve their economic status. Some researchers (Leatherman & Dunford, 2010) also term poor health as a dimension of poverty so growth in microfinance can be interconnected to socioeconomic growth. Besides that, microfinance borrowers are not the only beneficiary because when any of his/her family members become ill he/she can use the money to bring them to the hospital. Similarly his productivity is not only influenced by his own illness but also the illness of one of his family members. So it is expected that growth in microfinance will lead to improvement in maternal health. Political instability (e.g. politically motivated violence, probability that the government will be overthrown or destabilized by unconstitutional means and awful law and order situation) have received less treatment in the literature in perspective of financial stability and microfinance. Although (Svensson, 1998) showed that high degree of political instability will deter economic growth and investment to a large extent. But (Le, 2004) argued that political instability characterized with violent protests may hamper financial stability but if the protests are non-violent then it will not slow down economic growth.

The case of political stability may be more relevant in case of developing countries as several developing countries have experienced internal conflicts in the near past.

3. DATA & METHODOLOGY

At the end of year 2014, Microfinance Information Exchange covered approximately 2,000 microfinance institutions around the world. Microfinance Information Exchange is an institution with head office in Washington DC and regional offices in India, Peru, and Azerbaijan. According to Microfinance Information Exchange at the end of year 2011, gross loan portfolio of these microfinance institutions were equivalent to eighty seven billion US dollars with Ninety five million active borrowers. Total deposits were equivalent to 66 Billion US dollars and total depositors were 78 million. Data related to microfinance is downloaded from Market Mix database. Data concerning political stability is obtained from World Bank's worldwide Governance Indicators (WGI) project. Data to quantify change in maternal health is obtained from World Bank. The effect of growth in microfinance is measured with respect to five dimensions. Change in Number of active borrowers, Change in Gross Loan Portfolio, Change in Total Assets, Change in Personnel and Change in Equity are used as proxy for growth in microfinance. Effect of each variable as well as their aggregate index is used in the analysis. Principal component analysis (PCA) is used to amass individual microfinance growth measures into single microfinance growth index. Political stability index is obtained from World Bank's worldwide Governance Indicators (WGI) project. Adolescent fertility rate (births per 1,000 women ages 15-19) is taken as proxy for deterioration in maternal health. Then microfinance index is computed which is used as an aggregate measure of microfinance, using above said dimensions of microfinance by means of principles component analysis. Afterwards a change with respect to previous year for each dimension is calculated i.e. change in number of active borrowers of MFIs, change in gross loan portfolio of MFIs, change in total assets of MFIs, change in personnel of MFIs and change in equity of MFIs. Similarly a change in microfinance is calculated by subtracting previous year figure from current year figure. By using this methodology one figure for each variable for every country per year is obtained. Six interaction terms $cnabXcps$, $cglpXcps$, $ctaXcps$, $cpnlXcps$, $ceqtXcps$ and $micXcps$ are created by multiplying change in political stability with each of five dimensions of microfinance and microfinance index. Six separate regressions are run to inspect the moderating role of change in political stability in the relationship between each dimension of microfinance, microfinance index and millennium development goals. After applying regression it is found to be a challenging task to interpret interaction term manually. So we follow Aiken and West's methodology and graph the interaction terms. Microfinance index and its five dimensions are separately trichotomizes with change in political stability to get high, medium and low categories for each variable i.e. for each independent variable and moderating variable. These categories cross each other to provide nine cell means. Mod Graph as suggested by (Victoria School of Wellington School of psychology) is used for the analysis. One standard deviation above the mean is considered as "high" category, mean is taken to be the "medium" category and "low" is computed as one standard deviation below the mean. Mod graphs for some of the regressions are given in the analysis. Data of 41 countries from 2000 to 2012 is analyzed. A change is calculated with respect to previous year for all the variables. Lag is taken because of the reason that effect of growth in microfinance on maternal health is more visible in the forthcoming year rather than in the current year. Improvement in maternal health is negatively related to its proxy i.e. adolescent fertility rate (births per 1,000 women ages 15-19). Practice of centering of independent and moderating variables and generation of high, medium and low categories is used for examining the moderation effect of change in political stability in the relationship between microfinance, its dimensions and millennium development goals.

Fixed effect and Random effect models are applied in the analysis to investigate the relationship. Before applying regression data is checked for stationary.

4. RESULTS & ANALYSIS

When graphs of change in maternal ill health are investigated, it is observed that in nearly all of the countries, first there is a constant change and then an abrupt decrease is witnessed. It means that maternal health is improved in the recent past in most of the developing countries. To deeply investigate the state of affairs combined graph is also given in Figure 1, from figure it is seen that practically all the countries behaves in the same way i.e. first a constant change in maternal ill health is viewed and then decline in maternal ill health is beheld. But the degree of decline is not found to be same for all countries. Line graph of some countries is found to be much steeper as compared to the others. It implied that in some countries maternal health is much more improved as compared to others. To examine the effect of microfinance and its dimensions on maternal health and to investigate the moderating role of political stability in the relationship between microfinance and maternal health, random and fixed panel regressions are applied. As our proxy for maternal health is inversely proportional to improvement in maternal health so increase in value of the proxy is considered as deterioration in maternal health whereas decrease in value of proxy is considered as improvement in health. Results of six separate panel regressions are reported in Table 1 and Table 2. From regression results it is noticed that growth in microfinance and its dimension measured in monetary terms are playing their role in improvement of maternal health. Non-monetary dimensions of microfinance are not found to have significant impact on improvement of maternal health. It is recognized that growth in political stability is positively affecting improvement in maternal health. In other words a politically stable country will give more attention to tackle with the problem of maternal ill health. Coefficients for growth in political stability in six separate random effect models are found to be -7.261, -8.274, -8.120, -8.326, -8.251 and -7.834 when regressed on maternal ill health along with microfinance index, change in number of active borrowers, change in gross loan portfolio, change in total assets, change in personnel and change in equity with z-value of -2.380, -2.740, -2.600, -2.730, -2.740 and -2.540 respectively. Similarly coefficients for growth in political stability in six separate fixed effect models are found to be -7.826, -9.167, -9.363, -9.354, -9.127 and -8.872 when regressed on maternal ill health along with microfinance index, change in number of active borrowers, change in gross loan portfolio, change in total assets, change in personnel and change in equity with t-value of -2.310, -2.750, -2.750, -2.780, -2.740 and -2.550 respectively. All of random effect models are found to be significant at 1% level of significance whereas not all of fixed effect models are found to be significant at 1% level. A negative relationship between growth in microfinance and maternal ill health is spotted. It means that growth in microfinance will improve maternal health in developing countries. It is observed that one unit increase in growth of microfinance will decrease maternal ill health by 1.988 units which is statistically significant at 5% level with a p-value of 0.017. Furthermore growth in gross loan portfolios of MFIs and change in equity of MFIs are found to be statistically significant at 5% confidence interval whereas change in total assets of MFIs is found to be statistically significant at 10% level of significance. All are negatively related to maternal ill health. It is found that growth in political stability will moderate the relationship between change in total assets of MFIs and maternal ill health. From figure slopes of the three lines are found to be almost same. All of the lines have near to zero slopes. It is due to the fact that coefficient of change in total assets although significant is near to zero. It is also noted that line captioned "low" is on the top of the graph and line captioned "high" is on bottom of the graph. This further strengthens the argument that in high political stability there will be high improvement in maternal health whereas in low political stability there will be lower improvement in maternal health.

Figure 1: Combined graph for maternal ill-health in different countries with respect to years

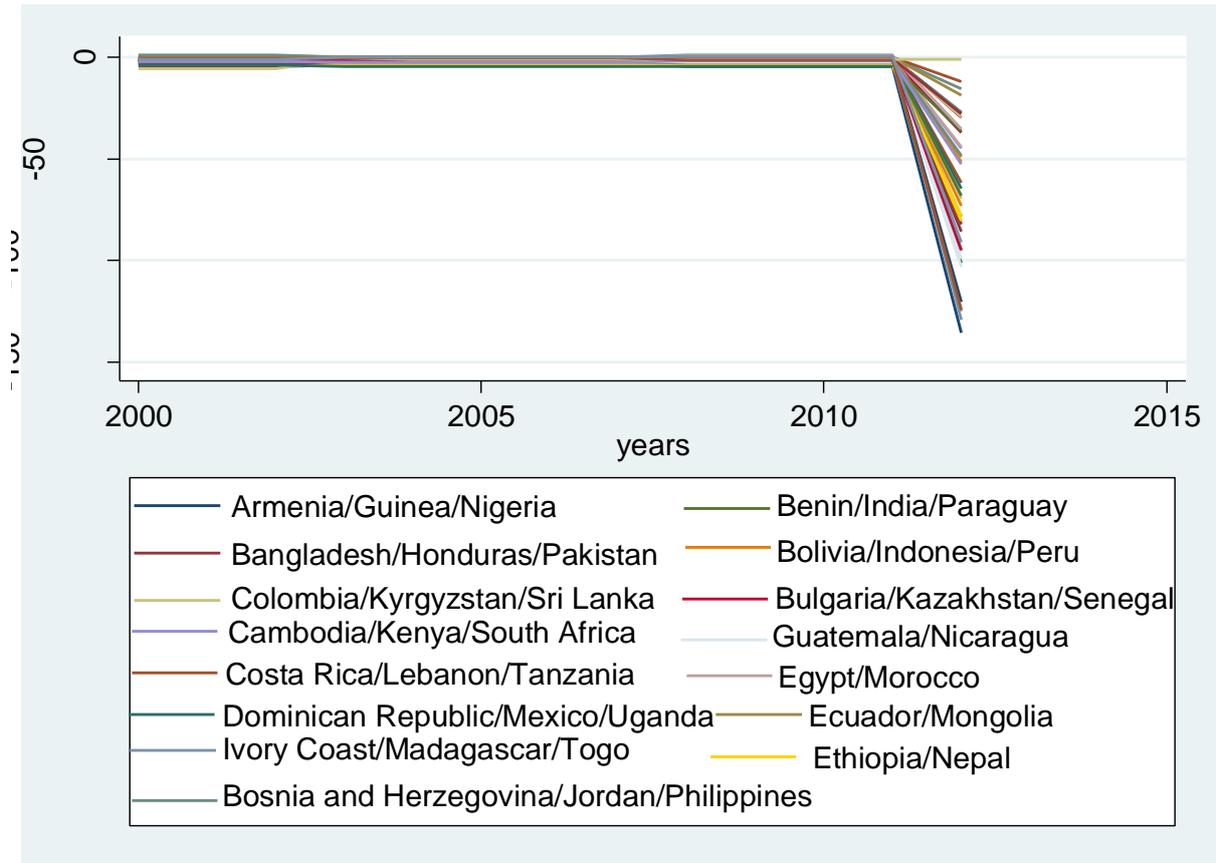

Figure 2: Country wise graph of maternal Ill-health with respect to years

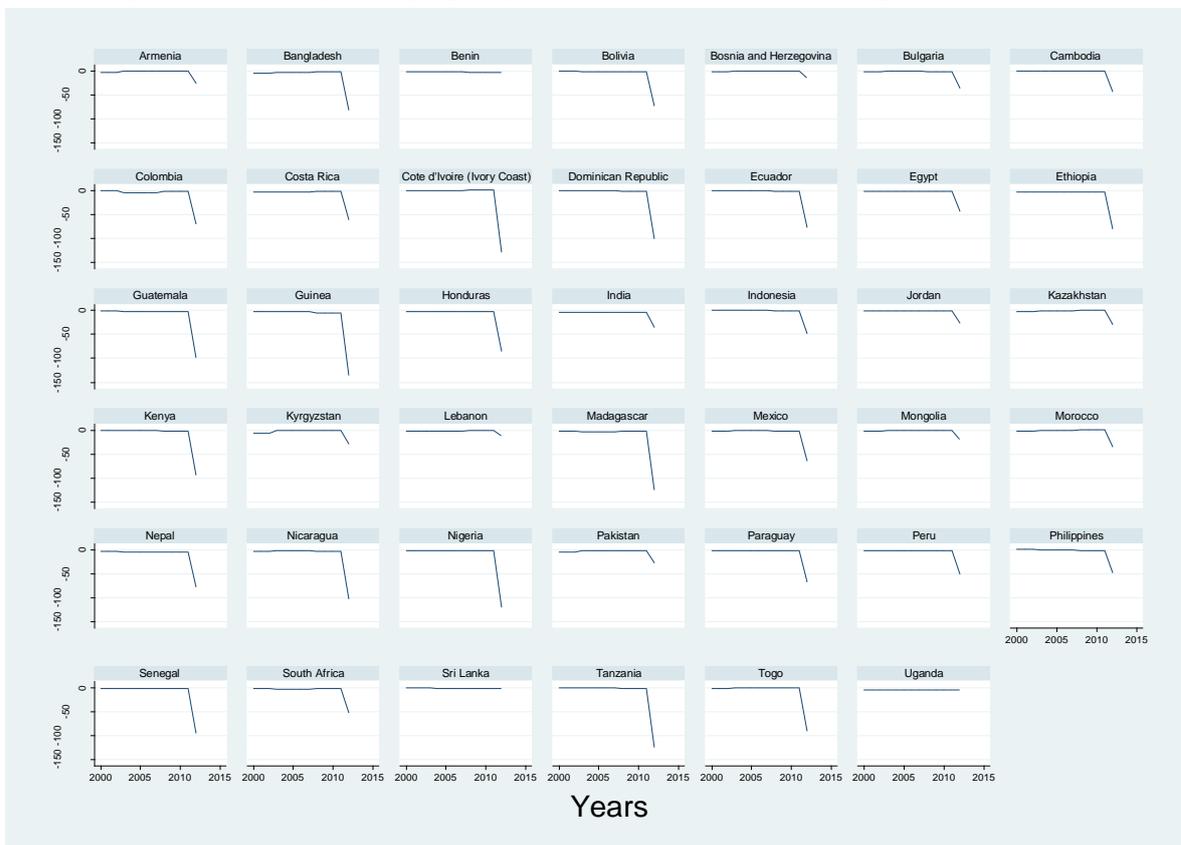

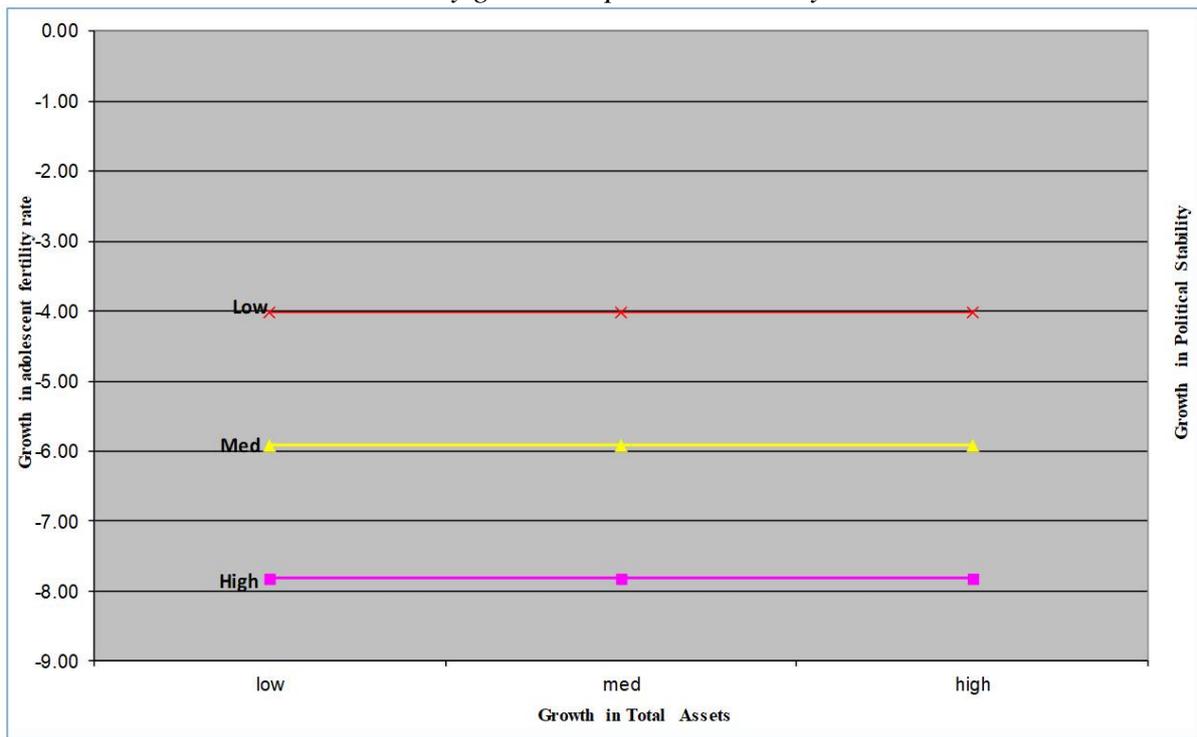

Table 1: Change in Adolescent fertility rate (births per 1,000 women ages 15-19) (CGOAL51), Microfinance Index (Mic), Change in political stability of a country (CPS), Interaction term between Microfinance Index and change in political stability of a country (MicXcPS), Constant term (Const), Change in number of active borrowers of MFI (CNAB), Interaction term between Change in number of active borrowers of MFI and change in political stability of a country (CnabXcPS), Change in Gross Loan Portfolio of MFI (CGLP), Interaction term between Change in Gross Loan Portfolio of MFI and change in political stability of a country (CglpXcPS).

Figure 3: Moderation of the effect of growth in total assets on growth in adolescent fertility rate by growth in political stability

5. CONCLUSION

The study concludes a positive role of microfinance in the improvement of maternal health. It is also identified that those countries which are politically stable have more control on issues related to maternal health. Similarly growth in microfinance has also improved state of maternal health in developing countries. Increase in gross loan portfolio of microfinance institutions has played a vital role in improvement of maternal health. It seems that borrowers are well aware of the fact that without good health they may not be able to earn their livelihood that's why they use the money for improvement of their health. Similarly in most of developing countries an increase in awareness regarding population growth is witnessed and people are adopting different methods to control size of their family which provide assistance in maternal health. Likewise it is originated that if more assets are acquired by microfinance institutions then more borrowers will be facilitated and hence improvement in maternal health is observed.

Policy makers can make use of microfinance as a tool to achieve their objective of improving maternal health through microfinance.

MACROECONOMIC ANALYSIS AND EVALUATION OF THE TRANSITION TO THE SUSTAINABLE DEVELOPMENT STRATEGY OF AZERBAIJAN

Mahish Ahmedov

Azerbaijan State University of Economics (UNEC)

ahmadov_28@mail.ru

ABSTRACT

Taking into consideration the world experience of economic development, global, national and regional characteristics, transition problem of the sustainable economic development of Azerbaijan, the country's development level, existing balance of resources and its utilization, forwarding movement of opportunities in the near perspectives, as well as the obtained results in all the sectors and directions of the national economy of Azerbaijan, the created economic, scientific-technical, financial potentiality, human capital, institutional, basing on the normative-legal and legislative bases of its theoretical and methodological and practically realizing problemes are researched in the aricle. Challenges of sustainable development strategy and its practical implementation: The systematic SWOT analysis of the development of the national economy, its strong and weak sides, capacities, negative-global pressures, threat identification, evaluation tasks are revealed in a logical consistency on the basis of 360-degree diagnostics. For the realization of the sustainable development concept mechanism of Azerbaijan, the implementation of innovation-oriented investment policy, creating a strong economic and market infrastructure meeting international standards, forming a national innovation system, sharpening the share of intellectual capital in (GDP) gross domestic product, implementation of appropriate inevitable institutional changes requiring the condition and demand of market in a global world, determination of the amount of transfers from the oil funds to the budget according to the "golden rule" principles, the optimal ratio application of sustainable fiscal and effective monetary policy with the process of socio-economic regulation, vast utilization of targeted programs in the major fields and directions of the national economy and in a whole it is necessary to deepen the reforms from the sustainable development point of view. The concrete suggestions and recommendations are put forward at the end of the article in accordance with the improvement process of sustainable development transition of the country in the near future.

Keywords: *sustainable economy, sustainability potential, safety conseption, competitievenes, human capital*

1. INTRODUCTION

The achieved success, created economic, social, scientific-technical, financial potential, human capital, infrastructure, the improvement level of social welfare of the population of Azerbaijan in socio-economic development level, as well as the the normative-legal legislation and institutional base set it as an issue in transition to the sustainable development as a constructive challenge in the last decade. At the same time, the global financial crisis and the declining fall in crude oil prices in the world market over the past two years, the devaluation of manat, the role and capabilities of oil factor, restriction of revenues in the development of national economies, and the decline of GDP with our trade partner countries have resulted in the balance of payments and budget shortage of non-oil sector of our country. The development of the intangible incitement strategy of the government in our country, which has been applying for a long-term perspective by deforming the economic development factors, criteria, the driving forces, principles and mechanisms of realization of economic growth, has an objective necessity.

2. THE CONCEPTUAL APPROACH OF THE IMPORTANCE, PRINCIPLES AND CRITERIA OF THE TRANSITION OF SUSTAINABLE DEVELOPMENT STRATEGY

Macroeconomic analysis and evaluation of the transition to the sustainable development strategy of Azerbaijan requires the SWOT analysis and 360 degree of diagnosis of the existing condition of socio-economic development of our country, as well as the analysis of the balance of resources available for our country, evaluation of the extent of their use and potential action in the current environment; identification of key factors of the development of the national economy, targets, determination of priorities, the regulation of the the existing forms of socio-economic process, methods, pinciples, provision of economic means and efficient realisation of social, ecological and istitutional development, stable fiscal and conseptual basis of effective monetary policy. Based on the above mentioned issues, the main directions of the strategic road map for the “National economy and main sectors of economy” were adopted on March 16, 2016 in our country (Azerbaijan Newspaper, 2016). The harmony of economic and social development, the unity of benefits and interests of present and future generations, as well as increasing the inclusiveness of the economy have been proposed as a strategic task for the first time in this roadmap. Considering the strengths, weaknesses, opportunities, possible jeopardies and threats of economic development on the basis of SWOT analysis, the competitive advantage of our country, in general, the philosophy, paradigm of economic development has been determined for the near future. This concept emphasizes that Azerbaijan is already in the post-oil phase of 2015, in order to form a complex, systematic, dynamic, logical economic reforms for the formation of post-oil economy in our country, the concept of reforms should be implemented in accordance with the main directions, goals and targets covering all fields of the national economy. In general, they are: investment-innovation; improvement of entrepreneurship environment; promotion of investment; implementation of structural and institutional reforms; increasing the competitiveness of the national economy; stimulation of the development of non-oil sector and export; government support for the development of income-generating labor areas and industries; improvement of salaries, pensions and benefits; promoting “Made in Azerbaijan” brand; etc. can be grouped on the directions. At the same time, the expectation of the national security of economy was defined as a condition of the formation and implementation of the economic reform strategy in our country. The strategic goals and targets facing the transition to a sustainable development model of our country require the proper adaptation of the structure of the national economy for changing conditions and the demand of the optimal balance between the real and financial sectors in the near future,. The analysis shows that in the near future the character of the economic development of our country will be: the movement of global economic power centers to newly emerging markets in Asia; significant impacts of technological innovations; the alteration of geopolitical configuration, the gradual decline in the impact of the oil and gas factor will significantly increase the opportunities of the non-oil sector. Analysis reveals that over the past decade, a substantial share of capital investment in the country's economy has been directed to the global oil and gas resources market. The creation and enhancement of logistics opportunities for the necessary socio-economic and social development infrastructure for t entrepreneurship with their main source financed by state budget and the transfers from the Oil Fund directed to the growth of the economy. In our opinion, the development should be considered as one of the most characteristic aspects of the improvement of sustainable development strategy of Azerbaijan. It will distinctively increase possible cataclysms against the sustainable and dynamic development of the national economy and the overall negative impact of geo-economy and instability in the near future. In general, from 1993 to 2018, the volume of capital investments in our country was much more than \$ 250 billion due to all financial sources. (Statistical Indicators of Azerbaijan, 2018) In the recent years, the International Monetary Fund(IMF) forecasts an annual

2-3% of growth of Azerbaijan economy by 2025, evaluating the potential and capacities of the country in all fields. Today, in fact Azerbaijan economy is in the transition period from quantitative changes to qualitative changes. Even though, the country where the economic growth is provided by resource factors, their provision opportunities with increased recycling production is limited, but the human capital, of course, is the only permanent and inexhaustible source. The provision opportunity and self development potential and competitiveness of the national economy in Azerbaijan reveals that the oil capital will decisively depend on the human capital in near perspectives. The analysis shows that, the following aspects must be taken into consideration: the world experience and national reality which are intended to implement and trying to characterize the perspective model of development aimed at ensuring sustainable development in our country in modern condition; expected optimum relatives of key and progress factors in economic growth, provision of national security, competitiveness of national economy, selection of correct priorities, in estimation of economic growth efficiency from the recycling point of view, forwarding the plan of social efficiency and effective utilization. However, P. Solow rightly points out that three key issues must be in focus while determining the economic policy. Firstly, the community should focus on the collection of less or more part of national income. Secondly, it must be determined how the economic policy can affect to the collection process and thirdly, it must be clarified how the change in economic policy can affect technical progress. M.Todaro pointed out that “ Development is a very multi-planned process, fundamental changes, people's behavior, social institutions, social structure accelerates economic growth, reduces unemployment and facilitates inequality in the society” (Todaro, 1997). As a matter of fact, the concept without the provision of competitiveness on the international scale, transition to the real sustainable development conception is impossible. M. Porter rightly points out that there is a significant impact on the competitiveness of the country's economy, along with known classical factors of economic development, based on the national conditions, in particular the national economy, the national culture, the mentality of public administration officials, even the history of the country etc (Porter, 1993). Of course, as P. Solow pointed out that, the expected sustainability rate between the existing capacities and the natural resources is a prerequisite for the development of sustainable development programs. Serious problems arising in provision of nature-society and harmony of human relations have been turned into an objective necessity for their sustainable development and revaluation in modern condition. Generally, from the 70s of the 20th century, new approaches to sustainable development have emerged in the concept of economic growth. Setting the conception of sustainable development as a practical issue in the international arena, takes its beginning from the report “Limits of Growth” prepared by The Club of Rome in 1971. It was particularly noted in the report that the use of natural, especially energy resources, with increasing scale and extravagance, greatly damages the environment, makes it useless, and in the long term doubts the possibility of normal living beings on the earth in the future. For the solution of this problem, the restriction of the extensive economic growth justifies the intensive development transition by observing the ecological balance. Taking into account the relevance and practical importance of the principles of the present report, an international conference on sustainable development was held in Stockholm in 1972. Consideration of the problem of resource constraints in this conference, was put forward as a call to humanity on the earth. Later, the fundamental principles, ways, mechanisms, priorities of sustainable development concept were identified at the international conferences held in 1992, 2002 and 2012. In 1972, Nobel Prize laureates Y. Nordhaus and J. Tobin’s “Is Growth obsolete?” research has also been proposed the model for the estimation of economic sustainability for the first time (Nordhaus, 1972). But in 1974, Robert Solou developed the conditions for sustainable development of economy for the first time. He pointed out that, the necessity of gradually increasing rate of devaluation for creation of a sustainability program of the economy to ensure sustainability between natural resources

in produced capital. Later, on October 20, 1987, the resolution of the 42nd Session of the International Federation of Individual Entities identified the basic principles of sustainable human development (Hollis, 1983). It is known that, the weak and strong sustainability notion have been differed in the world economic literature depending on economic development level of the country, integration from the selected development model to the world economy. "Weak sustainability- is so called development that it is not reduced from generation to generation". The other economists points out that, we are fully satisfied with the idea that weak sustainability is "regarded as a stable supply of consumer protection against worsening of fixed capital". It is very difficult and controversial process to identify accurate indicators and indices of the "weak and strong" sustainable development of those economists (Hahn,1993). "Sustainability-being a long-term economic, ecological and cultural viability" based on the unity of social, financial and ecological balancing of economic development (<http://sustainableseattle.org/>). Economic literature shows that, there are 5 key elements of sustainable economic development (E) indices and indicators for the evaluation of economy, ecology, justice, education and sustainable development (Guliyev,2002). Generally speaking, according to academician U.Alakbarov's idea, sustainable development involves the preservation of the lifestyle, the needs of the people, the poor balance between the improvement of the substance, the welfare of the natural resources and the ecosystem (Alakbarov, 2013). The analysis reveals that effective implementation of a sustainable development strategy in highly developed national economies has been identified by common principles, but its provision features in the mega, macro, mezo, micro and in the regional level should be taken into consideration. It further proves that, depending on the level of development of national economies of various countries, the role of individual factors can be different in increasing the competitiveness of the country. The strengthening of the social and humanitarian aspects of sustainable development in the international world over the last few years has become more urgent for practical utilization of those goals. In this regard, the "2030 Agenda" was adopted, taking into consideration the necessity of an institutional and policy-based approach for achieving sustainable development goals in our country up to 2030 in line with the goals of sustainable development adopted at the UN Summit in September 2015 and The National Coordinating Council for the Sustainable Development of Azerbaijan was established and transition to the inclusive economic growth concept was put forward as an important task. The provision of long-term inclusive economic growth is characterized by a strong negative impact on the disproportions, existing in the socio-economic development of the regions. Three Regional Development Programs covering 2004-2008, 2009-2013, 2014-2018 were adopted by the order of the President of the Republic of Azerbaijan for elimination of negative processes in regional economic development, which resulted in significant progress . Generally, fifty billion dollars have been spent on regional development in the country over the past fifteen years (Nuriyev, 2017).

3. THE OPPORTUNITIES, PRIORITY DIRECTIONS AND REALIZATION MECHANISM OF TRANSITION TO THE SUSTAINABLE DEVELOPMENT CONCEPTION OF AZERBAIJAN

World practice shows that the practical implementation of sustainable development in a specific context of any country is based on a logical sequence: systematic SWOT analysis of the development of the national economy, determination of goals, the extent to which the existing system of economic relations meets the national interests, and finally requires the estimation of its regulation form, method, scale in the globalizing world. In order to ensure sustainable development, each country must solve four problems. Firstly, to implement a system of measures to solve the ecological problems that arise as a result of the development of the world economy in modern conditions; secondly, to implement the necessary socio-economic programs to ensure sustainable human development; thirdly, formulation and implementation

of appropriate policies for the solution of demographic problems in the modern condition; the existing economic problems should be resolved systematically, taking into account current and perspective objectives for sustainable development; it should be emphasized that the possibilities for solving environmental, social and demographic problems are largely depend on the level and nature of economic development. At the same time, it should be noted that first of all the practical implementation is determined by the sustainable development conception of the country (Ahmadov and Huseyn, Baku 2014). At the same time, the analysis indicates that, while the sustainability potential is determined by the absolute advantages of the country, it can significantly increase its potential by implementing the correct, optimal, flexible economic policy, expecting the optimal stages of global, regional, national interests, current and perspective goals. From this point of view, the existing scientific-technical, financial, investment etc. the potential movement within their capacities and the allocation of resources should be considered optimally, allowing them to meet the current social and economic needs of the society as much as possible, but most importantly, do not restrict the financial welfare of these needs in terms of better payment and economic growth, in order not charge extra costs for future generations (debt, loan, etc.) (Ahmadov, 2005). The analysis shows that eventually, transition to a sustainable economic growth concept is largely depends on the development and effectiveness of the real sector. "The analysis of the Azerbaijan economy from the suggested point of view indicates positive results of the strategy. During the last 10 years macroeconomic stability has been maintained in the Azerbaijan economy, significant reforms have been made in the direction of diversification of the economy and entrepreneurship and necessary measures have been carried out. At the same time, the balanced development of the regions has been ensured, the economical competitiveness of the country has grown and the rapid integration of the country into the world economy has continued" (Muradov. 2018.). Provision of transition to the sustainable development is a direct problem with the expectation of the national economic security. The expectation of economic security is the internal and external factor covering the independence of the national economy, the stability of the recycling process at all levels in the country, the current and perspective goals and objectives, dynamic and sustainable development, as well as its constant renewal, self-development, may be referred to as a set of conditions, especially when it provides adequate financial support. As it is mentioned in the economic literature, "The financial viability of the country is one of the most important criteria for its economic independence. A state, which is unable to provide itself, could not provide its socio-economic development, its financial resources, could not be considered as a state (Muzzaferli, 2014). The concept of economic security should reflect not only the protection of national interests, but also the mechanism of protection and implementation of national interests, the development of national entrepreneurship and production, and socio-economic stability in society. In its' turn, achieving relevant results in the field of economic security, in some areas; revealing the prediction of the internal and external jeopardies for the society in terms of life, creating necessary information base through comprehensive objective monitoring of economic processes, to undertake a complex of flexible and long-term measures to prevent and eliminate possible negative consequences of economic dangers, timely adaptation to global economic and economic challenges, global competition, resource constraints, adequate response to internal and external threats are required. The characteristic analysis of the economic policy carried out in Azerbaijan during the years of independence shows that the government of Azerbaijan has developed and implemented an optimal economic development strategy in these years, the notion of "delay effect" has not been observed in economic literature. The government of Azerbaijan has always tried to keep the regulatory potential, especially between the financial and regulatory levels. The implementation of liberalization of the financial market without creating the appropriate regulatory framework is undoubtedly the usual recipe of economic instability (Stiglitz, 2004).

At the same time, Yantirberg's idea that the scale of the arrangement should be coordinated with the country's regulatory capabilities is of particular importance. In order to ensure sustainable economic growth, it is important to make the necessary structural and institutional changes in conditions, demand and potential (Fischer, 1988). Pointed out records prove that the appropriate changes should be carried out in the structure of the recycling for the improvement of sustainable economic development according to the changing circumstances and the needs, the proportion between the financial potential and real sector development. Thus, the evaluation of socio-economic processes based on the 360-degree diagnostics indicates that the production process can be effectively implemented in any national economy. However, if the division and exchange process in the country is not optimal, especially if the existing products and services are not used efficiently, then the overall economic growth will sharply fall and "impoverished economic growth" will be observed in the country. Analysis shows that, in regulation of socio-economic processes fiscal regulation has played a decisive role over the past few years in Azerbaijan. But over the past two years, the negative pressure of external factors, global challenges, sharp differences between domestic prices and world market prices for products and services, etc. the broad introduction of monetary regulation on the floating exchange rate regime of our country will be transformed to an objective necessity in the near future. It is also the fact that every law adopted in accordance with the effective implementation of the sustainable economic development strategy should take into account the current and perspective objectives, having a strong, intellectual load. As a matter of fact, the legislative framework for the regulation of socio-economic processes and the economic policy implemented by the state is reflected in this field. The objective evaluation of the impact of legislation of economic development dynamics and character (Regulatory Impact Assessment Seminar, 2016) is very important. In this regard A.L.Hillman strictly states that the legislative rights of stakeholders (owners) should be determined taking into account the possibilities and restrictions on managing socio-economic processes (Arye, 2000). The distribution of legitimate rights affects the mechanism of stimulation in this or that direction, respectively, on the distribution of revenue "through the effect of income". Therefore, provision of the effective functioning of a competitive and dynamically developing national economy, the effectiveness of the regulatory system, the model, which developed and applied in the country depends more on the management processes as a whole. Generally, while evaluating the impact of legislation on socio-economic processes, it should not be overlooked that the assessment of the environment, the provision of national economic security and competitiveness, as well as the expectations of the interests and benefits of the contemporary and future generations, should be taken into account. In recent years, as a result of the economic development strategy implemented in our country, significant progress has been made for improving the competitiveness of the national economy, inclusiveness, infrastructure development and the overall business environment, as well as the dynamics of economic freedom indices. In the "Global Competitiveness" Report for 2017-2018, the rating of the Republic of Azerbaijan rose two-fold to 35th in terms of inclusive growth, making it a third place among the countries with emerging economies.

4. CONCLUSION

Generally, macroeconomic analysis and evaluation of the existing condition of the development of Azerbaijan, considered measure system in the direction of the realization of the main sectors of national economy are based on the perspective development of the strategic road map. Forthcoming strategic targets, real objectives and potential opportunities of our country are based on the recently formed effective market mechanism, administrative and organizational practice. The provision of the transition of our country to sustainable development conception in a near perspectives; the realization of the innovation-oriented investment policy; effective operating relevant production: creation of social oriented market infrastructure; formation of

national innovation system; achieving a sharp increase in the share of intellectual capital in gross domestic product; implementation of necessary structural and institutional changes according to conditions and requirements of the world market, in a globalizing world.

EVALUATION OF EXPORT DIRECTIONS OF AZERBAIJAN IN THE WORLD MARKET

Muzaffar Mammadov

Associate professor at ASUE

muzmam@mail.ru

ABSTRACT

Trade is an ancient economic relation form among the countries and regions of the world. The development and expansion of trade caused to the establishment of the world market. The growth in a number of countries and population created foreign trade between the countries and formed export and import directions. The trends appearing in the world trade, the position of the Republic of Azerbaijan in world market, the situation of foreign trade, the export quotas of Azerbaijan, geographical and economical integration unities of export, commodity structure, the existing export directions of Azerbaijan over world countries, the suggested forecast of the export directions of Azerbaijan by 2030 are given, the main targets and export directions on the increasement of product export from Azerbaijan have been revealed in the research work.

Keywords: *world market, foreign trade, export, foreign trade quota, geographical and commodity structure of export, export directions*

1. INTRODUCTION

The world market historically formed on the basis of international labor division and is an ever-growing commodity and service exchange system, established by international trade-economic, currency-finance and credit relations between countries. The world market is an integral part of the world economy. The main reasons stimulating the development of the world market at the historical stages are considered as a building of ocean ships, railroad constructions, discovery of telegraph and further mass-media, the utilization of international channels, the creation of currencies, the formation of banks etc. Trade in its turn is rapidly developing and ever-expanding form of the world market. Trade unites all mankind for the sake of mutual dependence and interests. (James Abram Garfird). Trade, has been transformed into an international trade area by combining world countries under the influence of economic laws and regulations which underpins historical development stages. The investigation of the law of demand and supply in international trade replies the answer why the countries are trading with each other, after proving that the development is impossible without trade, and each country has to ask a main question: what policy should the country pursue in international trade: free trade or protectionism? From the ages of Adam Smith, the science of economics implements unambiguously free, independent trade, defends and prefers the liberalization of foreign trade relations [1]. However, the real condition of the national economies and the political processes occurring in the world reveals that some of the countries entering the trade, take a large gains-large incomes from foreign trade, while some countries are facing with a great defeat-great losses. The main reason of this problem is how to choose a foreign trade policy. Because profits or losses from foreign trade have a direct and indirect impact on the economic interests and economic position of the population of each country. The scale, trends and commodity structure of the world trade have completely changed over the last 100 years, and agricultural raw material trade transferred to the industrial product trade. If the commodity structure of the world trade was 66%, agricultural raw materials and industrial products were 34% at the beginning of the XX century, industrial products were 76%, agricultural raw materials and products fell to 24% at the beginning of the XXI century. It envisages that the world trade stride towards from raw material trade to finished product trade, the agrarian sector is industrialized and the "world factories"(People`s Republic of China)are establishing.

Expert calculations show that 3-5 times increasement of the transition from raw material-to-finished products, the creation of new value chains, give the chance to get additional revenue of 5-7 times through the creation of added value. From the beginning of the 21st century, the struggle began for markets in the world trade, "trade wars" are increasing, and every country tries to increase their export and foreign exchange reserves by increasing their domestic production, attempt to take a place and gain position in the world market. In this regard, each country should determine their profitable export and import directions. The World Trade Organization (WTO) emerged after the Second World War, and at present united by 162 countries of the world, is the world center for international trade, covers 97% of world trade in 2018. According to WTO reports, 52% of all exports in the world commodity trade (FOB) fall to a total share of 10 countries, being 9 % in the top three countries; China, the USA and Germany. The another opportunity which draws attention is that 52% of all imports in the world commodity trade still fall on the share of those 10 countries, with 13% in the USA, 8% in Germany and 7% in China. Japan, France, England, Italy, Netherlands, Belgium and Canada occupy the remaining 7 places by 5-2% [3]. According to the UNCTAD (United Nations Conference on Trade and Development) report, the main share of the commodity export structure of world trade is finished products (71.3%). The share on foodstuffs export form 6.6%, agricultural raw materials - 1.7%, minerals - 3.6% and fuel- 3.6%. After 1980, the share of finished goods in the world commodity exports has increased, and the share of food products and agricultural raw materials has decreased. While the share of finished products has increased in the export of both Developed and Developing Countries, the share of food and agricultural raw materials has declined. According to the development level of world countries classification, 72 percent of the world exports fall to the share of developed countries, 23 percent to the developing countries, and 5 percent to the countries with Transition Economies. Azerbaijan - implementing large transnational projects as a "Contract of the Century" which was founded in 1994, gaining large revenues, providing the effective utilisation of revenues, creating large foreign exchange reserves, transfered from importing country to exporting country and should determine its export directions for the next 30 years. That is why the Republic of Azerbaijan has prepared its own strategic roadmap and is going towards the direction. Azerbaijan - historically being the oil country and effectively utilizing its own oil resources will gain a large oil revenues over the next 30-50 years, together with diversifying its economy, eliminating oil dependence and turning into a major industrial, logistics and geo-economic center. 40% of oil, 23% of natural gas, 27% of coal, 7% of nuclear energy and 3% of hydrogen comprises in the structure of primary consumption of energy transportation of the entire world. It confirms that the share of oil and gas in the consumption of world energy transportation will be high for many years and successful energy policy of Azerbaijan will also earn significant revenues from its oil and gas exports. If the currency reserves of Azerbaijan were \$ 1.8 billion in 2003, this figure reached \$ 45 billion in 2018, in other words, foreign currency reserves of Azerbaijan grew 24 times in late 15 years. 554.4 million tons of crude oil, 308.5 billion cubic meters of natural gas, 16.5 million tons of petrol, 32.8 million tons of diesel fuel, 8.8 million tons of paraffin including gas condensate was produced in the country for 2004-2017. According to BP reports, 4382.4 million tons of oil was produced in 2016 in the world, of which share is 75.8 percent for non-OECD countries, 24.2 percent for OECD countries, 42.5 percent for OPEC countries, 57.5 per cent for non-OPEC countries, and only 1.6 per cent for EU countries. It is completely different situation in the consumption. The share of OECD countries in consumption, i.e. the share of developed countries club, is almost half, i.e. 47.5%. In the same year, oil production in Azerbaijan amounted to 41 million tons, i.e. 0.9 percent of the world's oil production, which is a great resource and source of income for the countries with less territory and population. The productivity of natural gas will grow more rapidly in the next 3-5 years, and the prescient oil-gas policy will yield profits.

2. FOREIGN TRADE AND EXPORT QUOTA OF AZERBAIJAN

Along with the production in the economic development of each country, its` access to the world market, efficient foreign trade relations, and especially the more profitable export trends play an important role. The foreign trade turnover of the Republic of Azerbaijan between 2010 and 2017, is the peak year - 2011 (USD 44.1 billion), the minimum year - 2016 (USD 21.6 billion), the peak year of exports again is 2011 (USD 34.4 billion), and the minimum again was 2016. If in 2011, export comprised 78% of foreign trade turnover by USD, this indicator was 60% in 2016. And its main reason was the unexpected decline of the national currency of Azerbaijan-AZN (manat) in 2015. After 2016, foreign trade turnover and exportation also began to increase. Foreign trade, determining the position of all countries, including Azerbaijan in the world economy, the place in the international market and the level of openness to the world market is the export and import quota. It is determined by the ratio of those indicators to GDP. The export quota of Azerbaijan for the last two years is given in table 1.

Table 1: The export quota of Azerbaijan

Years	GDP, USD billion	External trade turnover, USD million dollars	Export, USD million dollars	Export quota,(%) percent
2016	37.9	21596.6	13107.5	34.7
2017	40.8	22593.6	13811.6	33.7

Table 1 shows that in 2017, Azerbaijan's GDP and foreign trade turnover, as well as exports increased, in comparison with 2016. The export quota of Azerbaijan, which attracts attention, increased in 2016 compared to the previous year and reached 34.7 percent, which is a very high indicator for economies in transition.

3. GEOGRAPHICAL STRUCTURE OF EXPORT

The geographical position of Azerbaijan affects the geographical structure of its export. It is distinctly shown in Table 2.

*Table 2: Geographical structure of Azerbaijan's export
(USD million and weight in percentage)*

Countries	2016	2017
Europe	4558.6	8551.8
Asia	4211.2	4476.8
America	146.6	597.4
Africa	226.5	184.7
Oceania	0.6	0.7
Total	100	100
including:		
Europe	49.8	61.9
Asia	46.1	32.4
America	1.6	4.3
Africa	2.5	1.4
Oceania	0.0	0.1

Table 2 shows that total export increased over the past two years, including that to the European, Asian and American continents, but the export to African continent decreased. In 2017, 61.9 percent of export share fall on European continent, and only 1.4 percent of the share fall to African continent where there are 54 countries.

The first place in the export of Azerbaijan to the economic integration unions belonged to the Organization for Economic Co-operation and Development (OECD) with 65.7 percent in 2017, followed by the European Union (EU) with 54.0 percent and the Organization of Black Sea Economic Cooperation (BSEC) with 23.2 percent, Asia-Pacific Economic Cooperation (APEC) with 18.3 percent, the Organization of Islamic Cooperation (OIC) with 16.4 percent, the Economic Cooperation Organization (ECO) by 11.1 percent, the CIS countries by 7.6 percent, Organization for Democracy and Economic Development (GUAM) with 6.0%, ASEAN with 4.6%, European Free Trade Association (EFTA) with 1.3% and OPEC with 0.4%. It shows that the volume of exports is higher to OECD, EU and BSEC countries among economic integration associations and organizations, and economic relations with them are more intense. Therefore, measures should be carried out for maximum utilization of the power of these international organizations and international economic integration associations on geopolitical and geo-economic dimensions.

4. COMMODITY STRUCTURE OF EXPORT

The dependence on one product is a forthcoming challenge in the economic security of the country. Therefore, Azerbaijan goes through economic diversification by using oil and gas as a tool. The commodity structure of the export of Azerbaijan in 2016 and the forecast of the commodity structure of export for 2030 are given in Table 3.

Table 3: Forecast of Azerbaijan's commodity export structure on the International trade standards classification system

No	Products	2016 (factual)* million USD	Share in export, in percent (%)	
			2016 (factual)	2030** (forecast)
1	Mineral fuels	7955.8	87.0	80.7
2	Food products and live animals	478.2	5.2	6.0
3	Industrial goods	273.7	3.0	4.5
4	Chemical products	153.2	1.7	3.5
5	Transport equipment and machinery	103.3	1.1	1.5
6	Non-food raw materials (without fuel)	45.2	0.5	0.7
7	Drinks and tobacco	27.6	0.3	1.0
8	Animal and vegetable oils	191.2	0.2	0.5
9	Various industrial products	15.2	0.2	0.6
10	Other goods	76.8	0.8	1.0
	Total:	9143.3	100	100

* SSCRA (The State Statistical Committee of the Republic of Azerbaijan) data [4]

** Calculated by the author.

As it is seen from table 3, that mineral fuel - crude oil, oil products and natural gas have an absolute advantage in commodity export structure of Azerbaijan in international trade standards classification, comprising 87.0 percent of the total exports. The next products comprise between 0.2 and 5.2 percent. Calculations show that oil and natural gas will still have a large share in export for many years. However, as it is seen from the strategic roadmaps, that the share of mineral fuels will decrease due to development of manufacturing products and services in other sectors - especially in chemistry, machinery, agriculture, manufacturing.

5. EXPORT DIRECTIONS OF AZERBAIJAN

All developed countries gain much more revenues by accurate calculation of their export directions. Geopolitical and geo-economic position, geographical location, natural resources, scientific and technical situation of the countries in the world and other factors play a special role in this. Geographical location is an absolute advantage of Azerbaijan. The situation of the export directions of Azerbaijan in 2017 under the influence of such factors as: the utilization of resources, political stability, the implementation of transregional projects and those proposed for 2030 are presented in Table 4.

Table 4: Export directions of Azerbaijan by countries in 2017 and 2030

Top 10 countries in the export of Azerbaijan					
2017 (factual)			2030 (forecast)		
No	Countries	Share in export by percent	No	Countries	Share in export by percent
1	Italy	31.9	1	Italy	32.0
2	Turkey	9.9	2	Turkey	12.0
3	Israel	4.6	3	Russian Federation	5.0
4	Russian Federation	4.3	4	Germany	4.5
5	Czech Republic	4.0	5	Georgia	3.5
6	Canada	3.9	6	Israel	3.5
7	Georgia	3.4	7	Croatia	3.4
8	Indonesia	3.4	8	Indonesia	3.4
9	Germany	3.3	9	India	3.0
10	Portugal, etc.	3.2	10	China (PRC) etc.	3.0

Table 4 shows that, 71.9% of Azerbaijan's exports in 2017 fell to the share of ten countries, and up to one-third – 31.9% [5] to the share of only one country (Italy). Turkey, a very close and advisable for Azerbaijan from the geo-economical, historical and national point of view, and the Russian Federation with a large demand-oriented market comprise minority from the potential point of view. The exporting countries listed in Table 4 on the forecast of 2030, should be taken as the main direction in the upcoming decade. The geo-economic position affecting the economic development, the amount of natural resources, the attempts of territorial redistribution, national and religious discrimination, the clash of interests, etc. such rigorous factors require foreseeing and determination of the structure of the commodity export, its diversification and directions in all countries, including Azerbaijan in the new world order. The oil and gas projects implemented in Azerbaijan change the Eurasian energy map. Azerbaijan, being one of the 42 countries that have no access to the open sea, is now becoming one of the world's major transportation and logistics centers through the “North-South” transport corridor, the new geo-economic and industrial center of Eurasia.

6. CONCLUSION

The main targets for commodity structure of the increase in product export from Azerbaijan by 2030 are as follows:

1. Partial increase or stabilization of crude oil production, reduction of its export;

2. Creation of value added chains of large industrial enterprises producing high-tech petroleum products, perfumery and cosmetic products for transition from crude oil to finished oil products;
3. Increasing natural gas production and exports;
4. Increase of production and export of chemical products;
5. Rapid growth of fruits and vegetables, especially tomato production and export;
6. Rapid growth of cotton, tobacco, tea, honey, hazelnut, saffron and rice production and export;
7. Rapid growth of wine and mineral water production and export;
8. Rapid expansion of carpet production in Azerbaijan and increase of export;
9. Increasing the export of fish and fish products by rapid boosting of fisheries;
10. Increase of production and export of agro-processing products;
11. Increasing tractor exports through increasing production at Ganja automobile plant;
12. Increase of production and export in Nakhchivan, Neftchala and Ganja car factories, etc.

The main directions of product export from Azerbaijan to continents and countries until 2030 are as follows:

1. Increasing export by continents to Europe and Asia and by economic integration unions to European Union, CIS and ASEAN countries can promote national economic development;
2. Increasing fields of export to Italy, Turkey, Russia and Germany, preparation of projects on export promotion lines to new destination countries – India, China, Croatia, etc.
3. Expansion of product export, petrochemicals to Turkey, fruits and vegetables to Russia, petrochemicals and processing products to Germany, mineral water, plant-growing products, vegetables and processing products to the Middle East countries, increasing export of natural gas, chemical products, food products, etc. to South-East Asian countries.
4. Rapid expansion of transport-expedition and logistic services for the efficient use of the potential of East-West and North-South transport corridors passing through Azerbaijan;
5. Concentration of 71.9 percent of Azerbaijan's exports to 10 countries in 2017 is not considered geopolitically acceptable, and in the future it is deemed necessary to increase the number of export countries and their share in export.

ABSTRACT

Paper provides analysis of the impact of interest rates on manufacturing's share of GDP across countries and argues that 1) interest rates differently affects tradable and non-tradable sectors, 2) manufacturing is more sensitive to interest rate fluctuations than the non-tradable sectors, and 3) high interest rates lead to the shift from the manufacturing to the non-tradable sectors that negatively affects the trade balance of goods and services.

Keywords: *deindustrialization, interest rates, manufacturing's share of GDP*

1. INTRODUCTION

While a decline in manufacturing's share of GDP is a global tendency and takes place in both OECD and low income countries (Figure 1), its causes and consequences vary across countries. In OECD countries decline in manufacturing's share of GDP is due to increase in efficiency, high income per capita (Fisher, 1935; referenced by Maroto-Sanchez, 2010, p. 8) or high efficiency in manufacturing compared to service sector (Baumol, 1967), but in low income countries deindustrialization results in persistent trade deficit in goods and services (Figure 2).

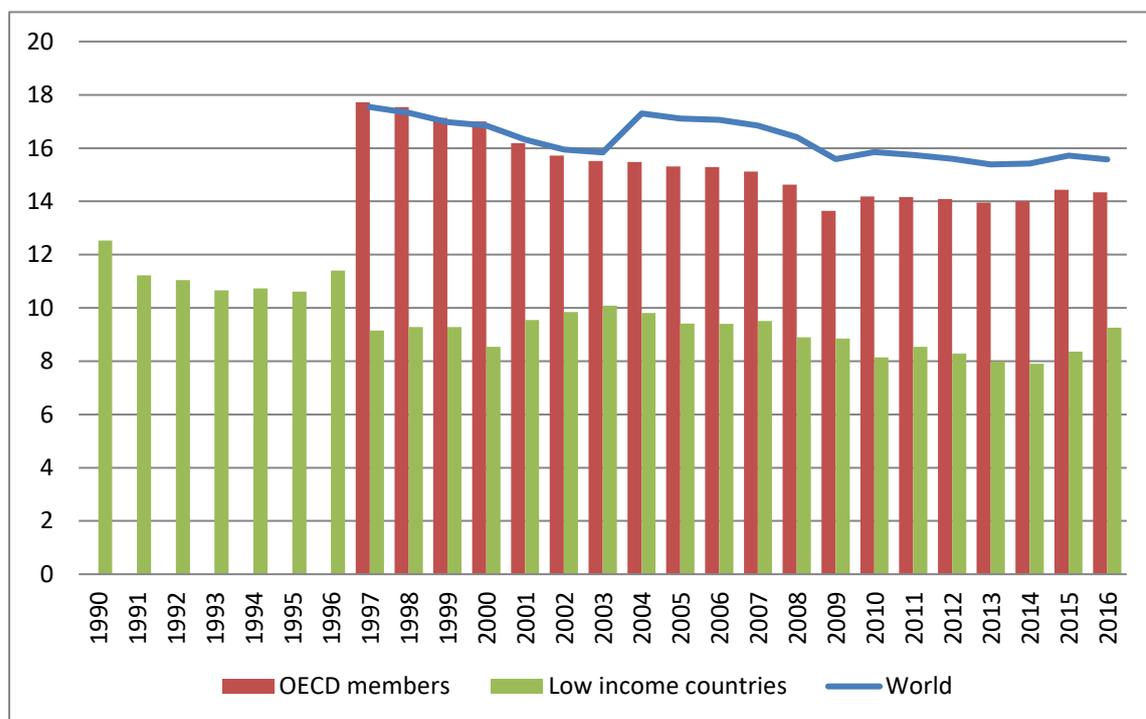

Figure 1: Manufacturing's share of GDP, % (World Bank)

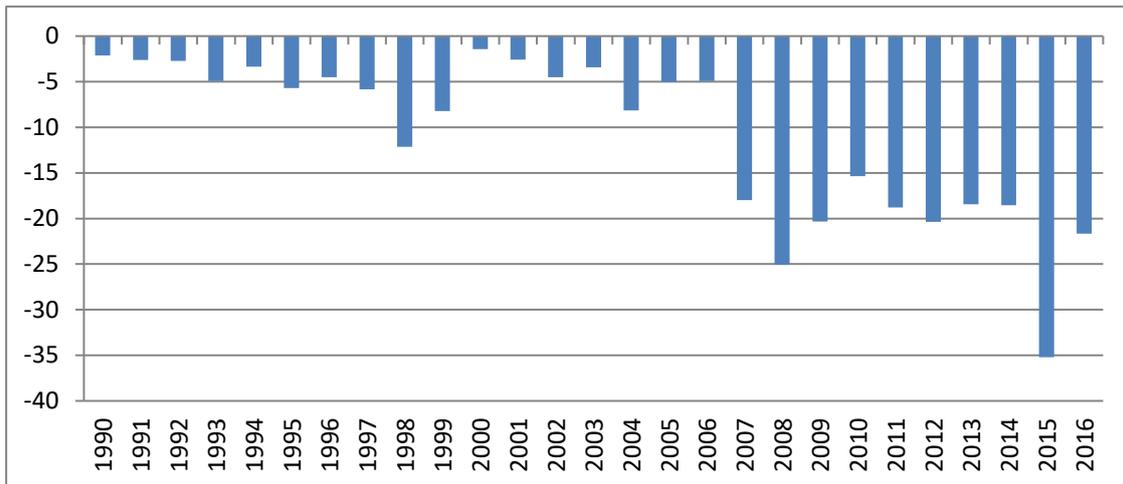

Figure 2: Net trade in goods and services in countries where manufacturing's share of GDP is less than 10% (except oil and OECD countries), billion US dollars (World Bank)

Researchers highlight the following causes of deindustrialization.

- Increase in productivity in economy. Increase in productivity causes rise in leisure time that leads to increase in service's share in consumption as people spend more time on entertainment, recreation and other leisure services (Dridea, Sztruten, 2010; Kraus, Barber, Shapiro, 2001).
- Other factor causing shift from manufacturing to service sectors is increase in income per capita. As demand for service (particularly housing, health and recreation) is income elastic compared to manufacturing goods (Fisher, 1935; referenced by Maroto-Sanchez, 2010, p. 8; Gemmell, Falvey, 1996), increase in income per capita leads to increase in service's share of GDP.
- Increase in efficiency in manufacturing compared to service sector also accelerates shift from the manufacturing to the services sector. There is a tendency for the outputs of the low-efficiency sector to decline. However if demand for the product of low-efficiency sector is price inelastic or income elastic, resources will be transferred to low-efficiency sector (Baumol, 1967). So, as demand for service is income elastic compared to manufacturing goods, efficiency increase in manufacturing causes resources to shift to service sector. A positive correlation between the efficiency gap between manufacturing and service sectors and decrease in the proportion of the manufacturing sector has been supported by many studies (Rowthorn, Ramaswamy, 1997; Hori, Mizutani, Uchino, 2018).
- In resources-rich countries decline in manufacturing's share of GDP is caused by appreciation of national currency due to the export of natural resources (so-called Dutch Disease) (Magud, Sosa, 2010).
- Appreciation of national currency induced by surges in capital inflows, foreign aid, remittances from immigrants, etc. also negatively affects manufacturing's share of GDP (Magud, Sosa, 2010). The negative effect of remittance on tradable sector in different countries has been supported by many studies (Uddin, 2015; Nikas, Blouchoutzi, 2014; Makhoul, Mughal, 2013).
- Hori, Mizutani, Uchino (2018) argue that decentralization of economy positively affects shifts from the manufacturing to the services sector.

In addition to the above, paper argues that high interest rates also contribute to low manufacturing's share of GDP. High interest rates imply higher cost for domestic firms but as manufacturing firms face foreign competition, they cannot pass the cost onto consumers by raising its price.

However firms producing non-tradable goods, which are not exposed to the foreign competition, are able to raise prices, passing on higher costs to consumers, and protect profit margins. As a result, manufacturing becomes less profitable compared to non-tradable sector that causes resources to shift from manufacturing to non-tradable sector. Paper argues that 1) interest rates differently affect tradable and non-tradable sectors, 2) manufacturing is more sensitive to interest rate fluctuations than the non-tradable sectors, and 3) high interest rates lead to the shift from the manufacturing to the non-tradable sectors that negatively affects the trade balance of goods and services.

2. INTEREST RATES AND MANUFACTURING'S SHARE OF GDP ACROSS COUNTRIES

Decrease in manufacturing's share of GDP is a global trend, and takes place in both OECD and low income countries. Researchers highlight the following causes of it: increase in productivity in economy (Dridea, Sztruten, 2010; Kraus, Barber, Shapiro, 2001), increase in income per capita (Fisher, 1935; referenced by Maroto-Sanchez, 2010, p. 8; Gemmell, Falvey, 1996), increase in income per capita, increase in efficiency in manufacturing compared to service sector (Baumol, 1967; Rowthorn, Ramaswamy, 1997; Hori, Mizutani, Uchino, 2018), appreciation of national currency due to the export of natural resources, surges in capital inflows, foreign aid, remittances from immigrants, etc. (so-called Dutch Disease) (Magud, Sosa, 2010), decentralization of economy (Hori, Mizutani, Uchino, 2018). In addition to the above, paper argues that high interest rates also contribute to low manufacturing's share of GDP. High interest rates imply higher cost for domestic firms but as manufacturing firms face foreign competition, they cannot pass the cost onto consumers by raising its price. However firms producing non-tradable goods, which are not exposed to the foreign competition, are able to raise prices, passing on higher costs to consumers, and protect profit margins. As a result, manufacturing becomes less profitable compared to non-tradable sector that causes resources to shift from manufacturing to non-tradable sector. In order to show the impact of interest rates on manufacturing's share of GDP statistically, we divided the countries into 3 groups. First group are countries where real interest rate on bank loans¹ is less than 5%, second group are countries where real interest rate on bank loans is 5-10%, third group are countries where real interest rate on bank loans is more than 10% (Figure 3). The Figure 3 shows that in the first group of countries, where real interest rate on bank loans is less than 5%, average manufacturing's share of GDP is 13.5%, in the second group of countries, where real interest rate on bank loans is 5-10%, average manufacturing's share of GDP is 9.5%, and in the third group of countries where real interest rate on bank loans is more than 10%, average manufacturing's share of GDP is 9.2%. The Figure 4 shows that among 15 countries where manufacturing's share of GDP is higher than 20% (2016) only in three countries real interest rate on bank loans exceed 5%.

Figure following on the next page

¹ Real interest rate on bank loans is the lending interest rate adjusted for inflation (as measured by GDP deflator)

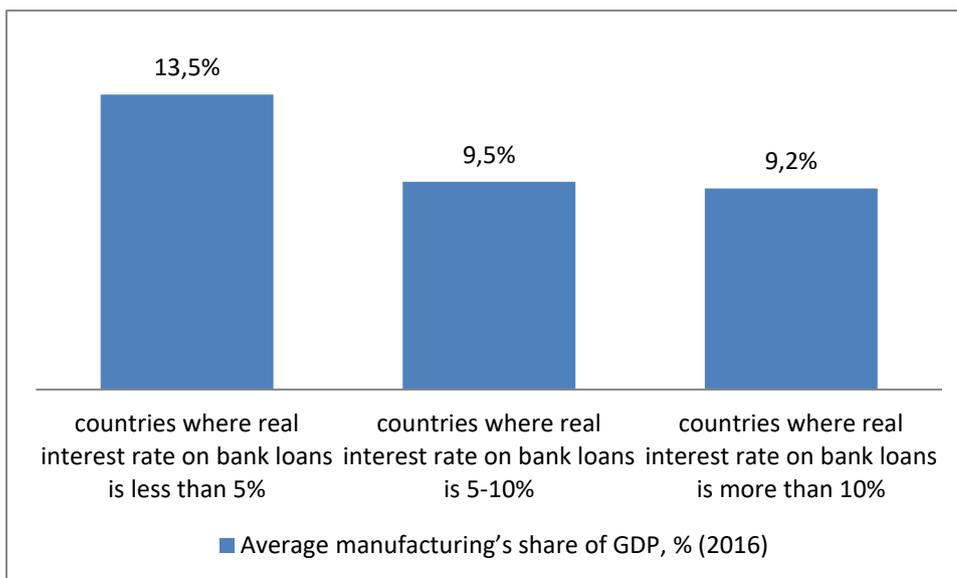

Figure 3: Real interest rate on bank loans (lending interest rate adjusted for inflation as measured by GDP deflator) (2010-2017) and average manufacturing's share of GDP (2016) (World Bank, Euro area statistics)

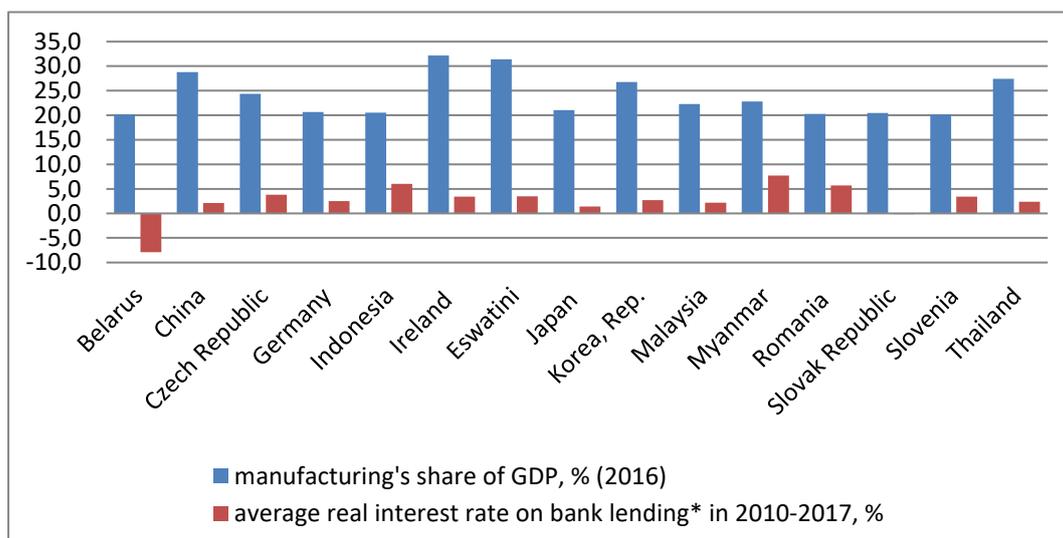

Figure 4: Average real interest rate on bank loans (lending interest rate adjusted for inflation as measured by GDP deflator) and manufacturing's share of GDP (World Bank)

*Real interest rate on bank loans is the lending interest rate adjusted for inflation (as measured by GDP deflator)

3. MANUFACTURING'S SHARE OF GDP IN AZERBAIJAN, AND FACTORS CAUSING IT

Azerbaijan also faced deindustrialization. In 2003-2017 the manufacturing's share of non-oil GDP in Azerbaijan declined from 11.9% to 7.1% (Figure 5). Decline in manufacturing's share of GDP resulted in increase in non-oil trade deficit in goods and services from 1.3 billion US dollars to 7.9 billion US dollars in 2000-2017². In Azerbaijan as in other resource-rich countries, decrease in manufacturing's share of GDP is traditionally associated with exchange rate appreciation (during oil boom in 2005-2014 real effective exchange rate of manat increased by

² Central Bank of the Republic of Azerbaijan

47%³). However high interest rates in Azerbaijan (Figure 6) also contributes to low manufacturing's share of GDP. When loans-to-added value ratio in Azerbaijan's manufacturing was low, lending rates had little impact on costs of manufacturing firms. However since 2006, as loans-to-added value ratio in manufacturing rose, impact of lending rates on firms' costs also increased that negatively affected the competitiveness of manufacturing and its share of GDP. In 2014 loans-to-value added ratio in manufacturing reached 73% that was higher than that of most post-Soviet countries (Figure 7). After depreciation of manat, as loans to manufacturing fell more than 3 times (from 2028 mln. manat in 2014 to 612 mln. manat in 2017)⁴, loans-to-value added ratio decreased to 19% that allowed manufacturing firms to reduce the costs and slightly improve the competitiveness.

* Loans-to-value added ratio in industry

4. CONSLUSION

Paper argues that interest rates differently affect manufacturing and non-tradable sectors. Manufacturing is more sensitive to interest rate fluctuations than the non-tradable sectors, and high lending rates lead to decrease in manufacturing's share of GDP below optimal level that negatively affects the trade balance of goods and services. The paper shoes that in countries, where real interest rate on bank loans is less than 5%, average manufacturing's share of GDP is 13.5%, in countries, where real interest rate on bank loans is 5-10%, average manufacturing's share of GDP is 9.5%, and in countries where real interest rate on bank loans is more than 10%,

average manufacturing's share of GDP is 9.2%. The paper also shows that among 15 countries where manufacturing's share of GDP is higher than 20% (2016) only in three countries real interest rate on bank loans exceed 5%. Paper also argues that high interest rates in Azerbaijan compared to other countries negatively affect the manufacturing's share of non-oil GDP and trade balance of goods and services.

ABSTRACT

Nowadays research in the field of wood science is focused on the development of innovative high value-added products derived from wood as well as on their maximized utilization rate. On one hand constant increase in yield and efficiency of processing of all sortiment of wood are most welcome, but on the other hand, decreasing quality of raw materials. One of the possibility how to solves this problem is application of innovative ecological acceptable adhesives for manufacturing wood products, which utilize also less quality raw materials and lignocellulose waste. Adhesive bonding has become an efficient and economically viable way for better utilization of wood feedstock and lignocellulose waste. In the manufacturing process of sulphate pulp, are created of lignocellulosic waste - kraft black sulphate liquors. At present organic components of the sulphate liquors are utilized in the regeneration process, i.e. they are incinerated to provide heat energy and carbon, which serves to reduce sodium sulphate to sulphide as one of the components of the cooking solution. Such recovery of waste generated does not lead to the solution of environmentally acceptable means of recovery of waste products. By modifying the treatment of waste sulphate liquors we can reciprocally replace some toxic components of polycondensation adhesives in the preparation of various wood materials (composites). In our research, we focused on the preparation of modified sulfate liquors (from lignocellulosic waste) that we applied the preparation of environmentally acceptable polycondensation adhesives in the experimental preparation of innovative wood materials demanded by customers in the wood consumer sector.

Keywords: *Effective recovery of waste, Innovative knowledge, Wood products*

1. INTRODUCTION

The problem of waste generation and the ways of its safe, environmentally acceptable and economically advantageous disposal is currently an exceptionally topical economic and also political problem in the global aspect. At the same time, the issue of the impact of the increasing amount of industrial waste on the environment and population health is very actually. Research is also looking for innovative solutions to help efficiently recycle or recover industrial waste generation so that environmentally acceptable materials can be prepared for consumers in different industrial sectors (Behin, 1987; Lynch, 1987; Bučko, 1997; Gargulak and Lebo, 2000; Lora and Glasser, 2002; Ružinská, 2018a,b). At present research in the field of wood science is focused on the development of innovative value-added products derived from wood as well as on a maximized utilization rate, e.g. production of wood-based products with utilization of industrial waste. However, as a result of efforts to improve the environment, while maintaining the required qualitative characteristics, global developments in the field of wood materials (as raw materials of the 21st century) have led to the development of new or effective modifications of existing technologies, focusing on reducing the emission of formaldehyde and other toxic components contain polycondensation adhesives applied to the preparation of composite wood materials (Lora and Glasser, 2002; Que and Furuno, 2007; Hatakeyama, 2010; Boruszewski et al., 2012; Figueiredo et al., 2018; Ružinská, 2018b).

The solution of the problem is reciprocal replacement of the toxic components (as phenol and partially formaldehyde) of currently produced polycondensation adhesives (especially phenol-formaldehyde resins - PF), e.g. by sulphate black liquors, which can be isolated as a secondary raw material from the pulp and paper industry in the production of sulphate pulp, where are created in the form lignocelulosic industrial waste (Duong, 2011; Behin, 2016; Kordheili, 2016; Ružinská, 2018a). However, sulphate liquors are characterized by a relatively low reactivity to formaldehyde, thus not requiring their incorporation into the polymeric matrix of mixed lignin-phenol-formaldehyde polycondensate. For this reason, it is necessary to modify the reactivity of the original sulfate liquor by the modification reactions: as methylation, acidification, phenolation, hydroxymethylation, demethylation and the other (Dolenko and Clarke, 1978; Xinnan et al., 1985; Van der Klashort, 1988; Wooten et al., 1988; Olivares et al., 1995; Shimatani and Sano, 1995; Vasquez et al., 1997; Lepifre et al., 2004; Ružinská, 2010; Behin, 2016). In our research, we focused on the preparation of modified sulfate liquors (from lignocelulosic waste) that we applied the preparation of environmentally acceptable polycondensation adhesives in the experimental preparation of innovative wood materials demanded by customers in the wood consumer sector.

2. WASTE SULPHATE LIQUORS

Alkali lignins are polydisperse, three dimensional macromolecules derived from native lignin by hydrolysis in alkali and subsequent precipitation under acidic condition. Absence of free phenolic hydroxyls and low cross-linking degree make alkali lignins applicable as substitutes of phenol in phenol-formaldehyde polycondensates (Chen, 1997; Çetin and Özmen, 2002). Properties of alkali lignin strongly depend on lignin origin, delignification procedure and separation method (Bučko, 1997; Lepifre et al., 2004; Hatakeyama, 2010; Ružinská, 2018b). Sulfate process lignin – especially when demethylated – is a convenient resource of aromatic raw materials for adhesives and polymers (Xinnan et al., 1995; Behin, 2016). Black liquor contains condensates of saccharic acids and lactones from the degradation of hemicellulose - mainly, *m*-saccharic and *p*-saccharic acids that indicate the presence of galactan in wood. However, glucosaccharic acid – a possible by-product from transformation of glucose and mannose - was never found in black liquor (Van der Klashort, 1988; Sivasankarapillai and McDonald, 2011). Kraft lignins exhibit variation in abundance and type of functional groups in molecules of different molecular weights. It has been found that the content of methoxy groups is directly proportional, while the content of phenolic hydroxyls and carboxylics is inversely proportional, to decreasing molecular weight of a molecule. It was proposed that low solubility of highly molecular components bearing no free carboxylic groups came from numerous hydrogen bonds limiting access for organic solvents. Thus, carboxylic groups affect the reactivity of a lignin (Wooten et al., 1988; Singh and Joshi, 1994; Santana et al., 1996; Sanjuan et al. al, 1999). In order to utilize lignin as a substitute for phenol, it is necessary to depolymerize lignin by oxidation, fusion, demethylation, pyrolysis or hydrogenation (Xinnan et al., 1995; Figueiredo, 2018). The modified lignin is a convenient raw material for adhesives, resins, dispersants, elastomers, foaming agents and eluting carriers (Wooten et al., 1988; Bučko, 1997; Vasquez et al., 1997; Gargulak and Lebo; Lora and Glasser 2002, Cazaku et al. 2004; Behin, 2016; Ružinská, 2010, 2018a,b). Structure of lignin, especially phenylpropane units, gives wide way for a variety of approaches that make lignin useful in the synthesis of phenol-formaldehyde resins. These are:

- Partial substitution of phenol with unmodified lignin (Lynch, 1987),
- Partial substitution of phenol with modified lignin (Dolenko and Clarke, 1978; Olivares et al. 1995; Shimatano and Sano, 1995; Xinnan et al., 1995, Behin, 2016).

3. EXPERIMENTAL PART

In the experimental part of the attention modifier treatment of origin kraft black liquor, which were subsequently applied to the reciprocal laboratory prepared adhesive mixtures. The modification reactions of the original sulfate liquors were carried out in order to increase the reactivity of the original kraft black liquor (as industrial lignocellulose waste) and to better incorporate it into the mixed polycondensate matrix of the formed PF adhesives. Prepared adhesive mixtures of resin (with reciprocal compensation PF resin 10 – 60 % wt.) was used in the laboratory preparation of wood materials – three layers plywood. Subsequently, the selected characteristics of the treated sulphate liquors as well as the experimentally prepared of innovative wood materials – plywood.

3.1. Determination of selected characteristics of origin and modified sulphate liquors

Sulfate liquor had been collected in a paper mill from the process line past the evaporator and characterized. The following properties were evaluated:

- Solid content was determined gravimetrically according to standard EN 10082,
- Dynamic viscosity was determined on a rotational viscometers Rheotest 2,
- pH value was determined on a digital pH-meter, type OP-208/1,
- Density was determined pycnometrically at 20 °C,
- Titration determination of Na₂S and NaOH content – as Na₂O was determined by analytical method (Boruszewski et al., 2012),
- Conductometric determination of Na₂CO₃ and NaOH was determined – as Na₂O (by SCAN-N-33 instrumental method),
- Lignin content by the Savard method (Olivares et al., 1995) involves 16-hr hydrolysis of lignin in 67 % sulfuric acid at ambient temperature followed by dilution and 5-hr refluxing. Afterwards, the suspension is cooled to room temperature, filtered off and dried under vacuum for 5 h.
- Reducing compounds was determined by the Bertrand method - the amount of reducing agents is most often converted to D-glucose (Bučko, 1997).

3.2. Modified treatment of waste sulphate liquor

Sulphate lignocellulose waste (kraft black) liquor is characterized by relatively low reactivity of formaldehyde which does not required to be incorporated into a polymeric matrix of PF adhesive. It is therefore necessary to modify the reactivity of the original kraft liquors following reactions: methylation and acidification kraft black liquors. The other modification reactions to increase the reactivity of waste sulphate liquors are: hydroxymethylation and demethylation. The basis of methylated treatment was the reaction of formaldehyde with waste sulphate liquor at room temperature for 72 hours (Dolenko and Clarke, 1978; Ružinská, 2018b). The way was prepared methylated kraft liquor, which was further applied to the adhesive mixtures with PF adhesive with a gradual reciprocal refund adhesive from 10 to 60 % wt. The second variant of the modification adjustment was in the previous post-treatment procedure prepared acidified sulphate liquors followed by a strong mineral acid with intensive stirring to value pH = 5. The third variant represents the modification of sulphate liquors, which is the application of the demethylation reaction (Olivares, 1988) and subsequently modified by Ružinská et al., 2018b. The principle of this modification is the isolation of sulphate lignin from sulphate liquors. Further, dispersion of the sulfate liquors and the action of demethylating agents in the organic acid medium followed by precipitation with mineral acid. The last fourth variant is the modification of sulphate liquors by the hydroxymethylation reaction (Shimatani and Sano, 1995) and subsequently modified by the authors Ružinská et al., 2018b. The basic principle of the application of sulphate liquors to phenolformaldehyde adhesives is their ability in the

alkaline environment to primarily form hydroxymethylated structures by the effect of formaldehyde in the sense of the lederer-manass reaction.

3.3. Preparation of adhesive mixtures

Adhesive mixtures to be applied in the preparation of plywood (PG), which were prepared with the reciprocal replacement of the original fenolformaldehyde adhesive (PF) and modified liquors gradually from 10 to 60 % by weight. Similarly, the reference test were used units - only with PF adhesive glue adhesives consisting only of origin kraft black liquors.

3.4. Laboratory preparation and evaluation properties of plywood

Experimental prepared 5 variants of three plywood (PG) mixed with the application of adhesive mixtures:

- variant 1 ("p"): PG with the application of the original untreated kraft liquors (from 10 to 60 % wt. reciprocal replacement of PF adhesive),
- variant 2 ("metyl"): PG with the application methylated liquors (from 10 to 60 % wt. reciprocal replacement of PF adhesive),
- variant 3 ("acid"): PG with application acidified liquors (from 10 to 60 % wt. reciprocal replacement of PF adhesive),
- variant 4 ("hydrox"): PG with application hydroxylamethylated liquors (from 10 to 60 % wt. reciprocal replacement of PF adhesive),
- variant 5 ("demet"): PG with application demethylated liquors (from 10 to 60 % wt. reciprocal replacement of PF adhesive).
- Reference samples: variant 0 (PG with the application only 100 % PF adhesive) and variant 100 (PG with the application only 100 % origin untreated or modified sulphate liquors – variants: 2, 3, 4, 5).

Various variants of three-ply plywood beads with the application of adhesive mixtures (with origin or modified sulphate liquors) were prepared experimentally under the following conditions:

- pressing temperature: 150 °C
- manometric pressure: 7.6 MPa
- specific pressure: 1.8 MPa
- pressing time: 4.5 minute
- material: beech veneer (1.8-1.8-1.8 mm)
- veneer humidity: 6.58 %
- area of the pressed material: 1225 mm².

After pressing, the plywood was conditioned for 14 days (at 20 ± 2 ° C and $65 \pm 5\%$ humidity) and their selected mechanical properties were evaluated:

- Evaluation of shear strength in dry condition according to standard EN 314-1,
- Evaluation of shear strength after exposure EW test in according to EN 314-2.

4. RESULTS AND DISCUSSION

In the experimental part of our research, we focused on the study of modification reactions of sulphate liquors to increase its reactivity and better incorporation into the mixed polymeric lignin-phenolformaldehyde matrix in the process of crosslinking of the proposed and prepared adhesive mixtures. We first examined and evaluated the selected characteristics of the original untreated sulfate liquors, which we obtained as a waste material from the pulp and paper industry in the sulphate process of pulp preparation.

We have evaluated the characteristics of the original black sulfate liquors in order to obtain data to evaluate the effect of subsequent modification reactions to increase the reactivity of this waste product. The results obtained from the determination of the individual characteristics of origin kraft black liquors are given in Table 1.

Table 1: The selected characteristics of sulfate black liquor

Specification of evaluated characteristics	Value
Solid content (%)	54.03
Dynamic viscosity (20°C) (mPa·s)	1245
pH value	13.65
Density (g·cm ⁻³)	1.319
Na ₂ S as Na ₂ O (g·dm ⁻³)	3.91
NaOH as Na ₂ O (g·dm ⁻³)	5.74
Na ₂ CO ₃ as Na ₂ O (g·dm ⁻³)	31.98

Source: own measurement by the author

Due to the low reactivity of sulphate lignin (from black liquors) towards formaldehyde and subsequent insufficient incorporation into polymeric matrix upon polycondensation, the following modifications may be performed: methylation, acidification, hydroxymethylation and demethylation. Procedures for implementing modifying reactions are discussed in chapter 3.2. The efficacy of the modification reactions was evaluated with the content of lignin and the amount of reducing substances in the modified sulphate liquors and compared them with origin kraft black liquors. The evaluated results of the lignin content (as determined by the Savard method) are shown in Table 2.

Table 2: Savard lignin content in the tested samples

Sample designation	Type of sample	Savard Lignin (%)
p	Origin sulfate black liquors	23.10
metyl	Methylated sulfate sulphate liquors	74.63
acid	Acidified methylated sulfate liquors	76.39
demet	Demethylated lignin	71.87
hydrox	Hydoxymethylated lignin	75.07

Source: own measurement by the author

However, the main problem is reactivity of lignin towards by-products of acidic degradation. In strong acidic environment at elevated temperatures, secondary depolymerization of lignin followed by elimination and condensation reactions occurs, so that the structure and functional group abundance are affected. Formation of new chromophore groups (e.g. methylquinones) results in dark colour of products. Drawback of the procedure is degradation of monosaccharides present in hydrolysates to 2-furaldehyde, 5-hydroxymethyl-2-furaldehyde etc., so secondary condensation with lignin may occur (Bučko, 1997; Boruszewski et al., 2012). Despite the accompanying phenomenon of that determination Savard's method of determining lignin content in test samples of both original and modified sulphate liquors is a comparatively simple method of determination. However, the lignin values in the sulfate liquors present objectively verifiable values which confirm the increase in reactivity of the sulfate leachates by the modifying reactions (Bučko, 1997; Ružinská, 2010). From the measured and evaluated data concerning the application of modifying treatments to the original sulphate liquors (methylation, acidification, hydroxymethylation and demethylation), it is clear that the

modification reactions mentioned above resulted in an increase in the sulphate lignin present in the treated liquors. Most of the increase in reactivity was recorded in the acidified variant, then the hydroxymethylated (hydrox), methylated (methyl), demethylated (demet) variants. The lowest percentage of lignin content determined by Savard was observed in the original untreated sulfate liquors. We also evaluated the reactivity of sulphate liquors from the point of view of the content of reducing substances. Products of alkaline degradation of saccharides exhibit reducing activity (Bučko, 1997). Reducing compounds content in the tested samples was shown in the Table 3.

Table 3 Evaluation of reducing compounds in the tested samples

Sample designation	Type of sample	Reducing compounds (mg·l⁻³)
p	Sulfate black liquor – origin unmodified	0.0433
metyl	Methylated sulfate black liquors	0.0654
acid	Acidified sulfate black liquors	0.1537
demet	Demethylated sulphate liquors	0.0486
hydrox	Hydoxymethylated sulphate liquors	0.0592

Source: own measurement by the author

As the data in Table 3 indicate, regardless of the sample type, the content of the reducing compounds was at very low level. However, studied adhesive systems (Ružinská, 2018b) based on sulfate liquor or methylated sulfate liquors exhibited high quality of the formed bond lines which may possibly be associated with substantial content of reducing compounds (0.1537 mg·l⁻³). The highest content of reducing substances was recorded in the acidified sulphate liquors and subsequently in the methylated liquors. In order to verify the reactivity enhancement for better incorporation into the polymer matrix of mixed adhesives, we evaluated the selected adhesive properties in the experimentally prepared three-ply plywood. We assumed that by increasing the reactivity of sulphate liquors by modifying reactions, adhesion and hence shear strength in the variants of modified sulphate liquors can be increased as compared to the original kraft black sulphate liquors. In order to determine the effect of modifying reactions, we designed and assembled 5 variants of adhesive mixtures (chapter 3.3) and we applied them to the preparation of three-ply plywood (under the conditions given in chapter 3.4). Subsequently, we evaluated the adhesion properties of the prepared plywood in the shear strength tests - under dry conditions and after the EW-100 exposure test according to standards EN-314-1 and EN3014-2. The results of the shear strengths of the variable variants of the experimentally prepared plywood were evaluated in the STATISTICA program and are graphically illustrated in the Figure 1 and the Figure 2.

Figure following on the next page

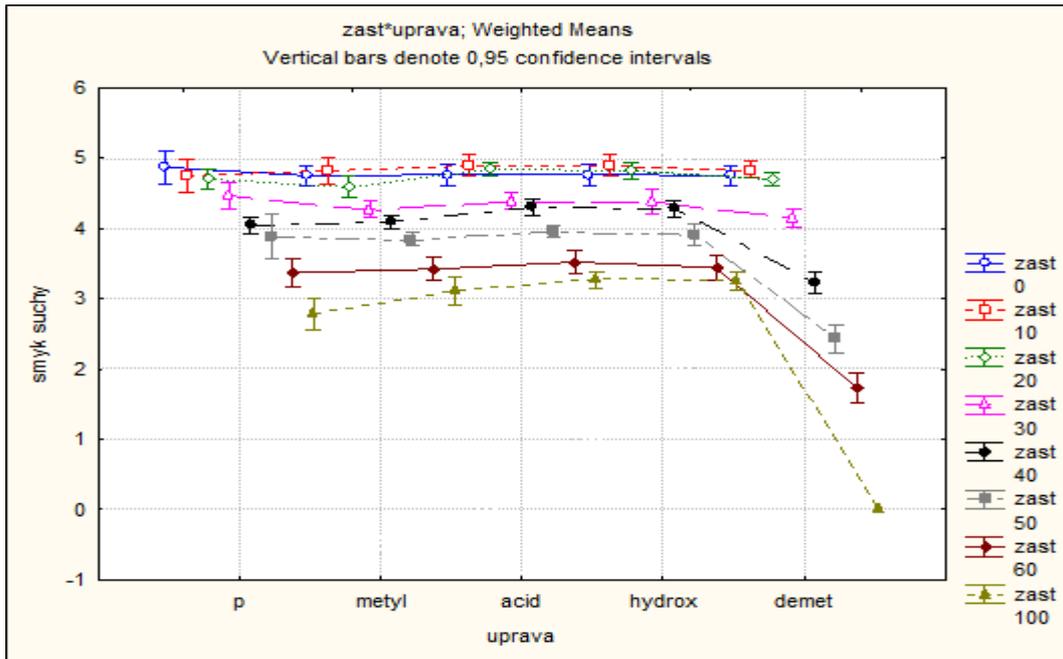

Figure 1. 95 % Confidence intervals the average of shear strenght by dry conditon (MPa) for laboratory prepared plywood with varying reciprocal replacement of PF adhesive with sulphate liquors (from 10 to 60 % wt.)

notes: smyk suchy – shear strenght by dry condition “uprava” – modified treatment, p – origin kraft black liquor (variant I), “metyl” – methylated sulphate liquor (variant II), “acid” – acidified sulphate liquor (variant III), “hydrox” – hydroxylated sulphate liquor (variant IV), “demet” – demethylated sulphate liquor (variant V), “zast” – reciprocal replacement (10, 20, 30, 40, 50, 60 % wt., reference sample: 0 and 100 % wt.)

Source: author

From the presented results of dry shear strengths (Figure 1) in experimentally prepared plywood, it is clear that all prepared variants of the plywood with the application of modified mixture polycondensate adhesives have achieved comparable results to that of the reference sample - Variant 0 (application of pure pure PF adhesive without sulphate liquors) but only to reciprocal refunds up to 30 – 40 % wt. Individual variants of prepared plywood have shown that adhesive joints are comparable in reciprocal replacement of toxic commercial PF adhesive with sulphate liqours as follows: highest dry shear strengths were recorded with a PG variant with the application of acidified sulphate liquors, where they can reciprocally replace up to 40 % wt. commercial PF adhesive. Other in turn are PG with a methylated, hydroxymethylated and demethylated sulphate liquors, where 30 % wt. is possible reciprocal replacement of commercial phenolformaldehyde adhesive.

Figure following on the next page

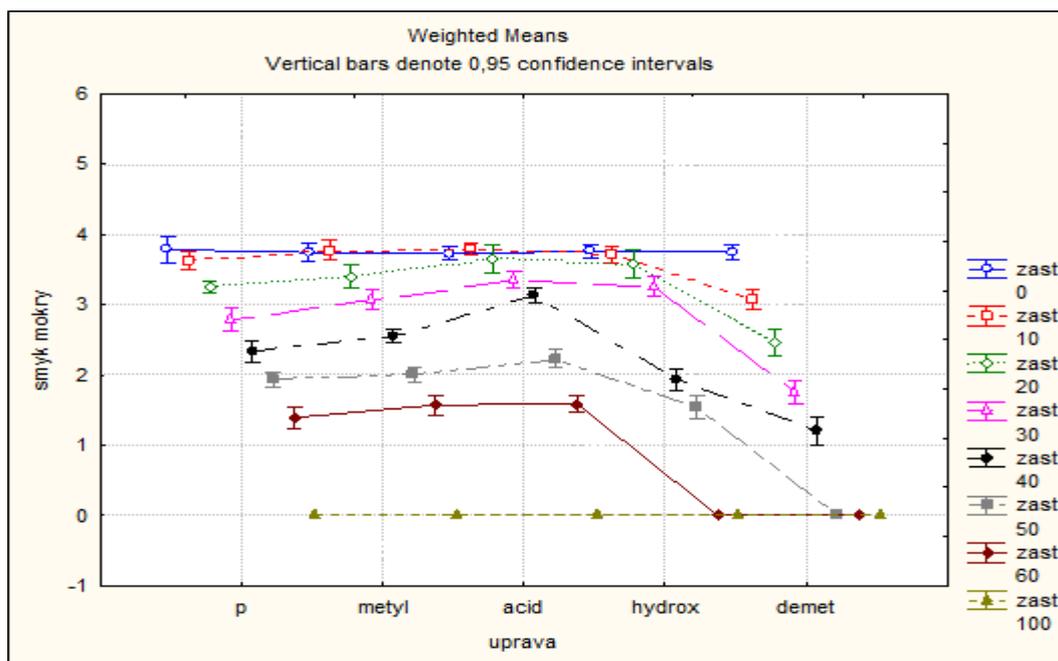

Figure 2. 95 % Confidence intervals the average of shear stress by exposition test EW 100 (MPa) for laboratory prepared plywood with varying reciprocal replacement of PF adhesive with sulphate liquors (from 10 to 60 % wt.)

notes: smyk mokry – shear stress by exposition test EW100 “uprava” – modified treatment, p – origin kraft black liquor (variant I), “metyl” – methylated sulphate liquor (variant II), “acid” – acidified sulphate liquor (variant III), “hydrox” – hydroxylated sulphate liquor (variant IV), “demet” – demethylated sulphate liquor (variant V), “zast” – reciprocal replacement (10, 20, 30, 40, 50, 60 % wt., reference sample: 0 and 100 % wt.)

Source: author

Presented results of shear strength of plywood prepared under conditions after the EW100 exposure test (Figure 2), that comparable results with variant 0 achieved individual variants of PG only 2 variants: one with application of acidified sulphate liquors to 40% wt. reciprocal substitution and the second variants with methylated and hydroxymethylated liquors up to 30 % by weight substitution of the original commercial PF adhesive. PG with demethylated sulphate liquors achieved comparable results with variant 0 only up to 20 % wt. reciprocal replacement of PF adhesives with treated waste liquors. From the evaluation of the shear strengths of the experimentally prepared plywood with the application of the original, unmodified kraft black sulphate liquors, it has emerged that even such a waste product is useful in the preparation of ecologically acceptable sulphate liquors and also in the reduced reactivity of these waste liquors (due to the relatively low content of lignins) of the substances yielded comparable adhesion strengths to reciprocal substitution of 20 % by weight under dry conditions and also after the EW-100 exposure test.

5. CONSLUSION

The goals of our research was to propose and prepare innovative environmentally acceptable products with a significantly reduced content of pollutants (phenol, partially formaldehyde) reciprocal replacing these toxic ingredients and utilizing the potential treatment of industrial waste from pulp and paper industry. At present organic components of kraft black sulphate liquors are involved in the regeneration cycle as carriers of energy and carbon necessary for the reduction process of boiling of cooking solution, which means only a partial energy use, but not a full material recycling (or recovery) of the resulting waste liquors generated by the

sulphate pulp preparation process. For evaluation of selected characteristics of origin kraft black liquors and modified sulphate liquors it is clear, that the modification reactions resulted in an increase in the sulphate lignin present in the treated liquors. Most of the increase in reactivity was recorded in the acidified variant. Also the content of reducing substances was recorded in the acidified sulphate liquors variant. The increase in reactivity by modifying treatments has been shown to be the most important in this variant (acid – acidified sulphate liquors), with the best adhesion bonds - the highest values of shear strengths under dry conditions and even after the EW100 exposure test. Reciprocal substitution achieved by 40% by weight. was prepared for significant material recovery of waste liquors, preparation of adhesive mixture with a significant ecological aspect (replacement of toxic components) and economic savings of expensive commercial PF adhesives (40 %). The proposed modifications of sulphate liquors have shown that, based on the results of the research, it is possible to effectively apply the black liquors to the wood materials - plywood. In this way, we will achieve a significant recovery of the industrial waste (lignocellulosic) from the point of view of material recycling and, at the same time, obtain reciprocal substitution of problematic (toxic components - as phenol and partial as well as formaldehyde) in commercially produced polycondensation PF adhesives, improving the hygienic characteristics so that they are environmentally acceptable adhesive mixtures, and also innovative wood materials. The results of our research have shown that we need to focus again on the recycling and re-use processes of pulp and paper pulp sulphate processes. The resulting sulfate liquors as industrial lignocellulosic waste are a valuable source of raw materials for use in innovative wood materials, needed for many industries as well as for end customers.

ABSTRACT

Competitive advantages are distributed unevenly in the country's economic space, resulting in regional inequality. The regional state policy should be aimed at greatest possible smoothing of the regions' socio-economic development levels. Scholars in the field of regional economics analyze effectiveness of various approaches to territorial management, intended to smooth intra- and interregional differences in terms of monetary (financial flows) and non-monetary (quality of life) indicators. Among the theories offering a solution to this problem is the growth poles theory. It is based on the assumption that growth occurs unevenly in economic space: it is concentrated in certain areas and subsequently, thanks to the "spreading" mechanisms, it covers the entire economy. Growth poles theory proponents believe that limited resources should be invested in industries/agglomerations more capable of growth and development than others. Through interaction mechanisms between economic entities, growth impulses are transmitted to other industries/agglomerations. As a result, growth poles "pull" the rest of the economy up to their own level. The growth poles theory has been developed by a number of scholars, in addition, developed and developing countries have accumulated considerable practical experience in the implementation of the concept. The purpose of this article is to analyze the practical experience of territorial management based on the growth poles theory accumulated since the beginning of the XXI century. In the first part we will focus on the growth poles theory evolution and its critical understanding. In the second part we will describe the practical experience of a number of states in the growth poles theory application to economic systems management. In the third part, we will demonstrate how the growth poles concept can become an integral part of the strategy for spatial development of the territory (in particular, the region) along with other concepts of spatial economics.

Keywords: *growth pole, spatial development, spatial economics, strategy*

1. INTRODUCTION

The purpose of this article is to analyze the practical experience of territorial management based on the growth pole theory accumulated since the beginning of the XXI century. In the first part we will focus on the growth pole theory evolution and its critical understanding. In the second part we will describe the practical experience of a number of states in the growth pole theory application to economic systems management. In the third part we will demonstrate how the growth pole concept can become an integral part of the strategy for spatial development of the territory (in particular, the region) along with other concepts of spatial economics.

1.1. Literature Review

We shall note that there exists a broad literature on growth pole theory. A number of papers, such as (Perroux, 1970; Boudeville, 1966; Aydalot, 1965; Darwent, 1969; Lasuen, 1969), provide a theoretical basis of the theory. Other papers develop a theory further (Richardson, 1975; Thomas, 1975; Campbell, 1972) or criticise it (Mønsted, 1974). The sufficient amount of literature is dedicated to deciding whether certain object(s) can be considered as growth pole(s) (Adams-Kane et al., 2011; Magomedov, 1998; d’Hautesserre, 1999; Cristea, 2013; Eikeland, 2014; Ehinmowo, 2010; Van Den Berg et al., 1996). Finally, there are papers assessing practical experience of implementing the growth pole strategy in different countries (Conroy, 1973; Kinsey, 1978; Ryder, 1990; Ukrainskiy, 2011; Toy et al., 2016; Speakman et al., 2013; Serra, 2003; Christofakis et al., 2011; Growth Poles: The Next Phase, 2013). We would like to mark out the two-part article by British scholar John Parr (Parr, 1999a; Parr, 1999b). Parr’s paper summarises practical aspects of implementing growth pole theory in both developed and developing countries during the XX century. We could not, however, allocate any papers, that would have summarised and analysed practical experience of implementing growth pole strategy in XXI century accumulated to date. That fact has determined the purpose of the present article.

1.2. Growth Pole Theory Evolution

1.2.1. Origin and Main Theoretical Framework

The growth pole theory was established in the middle of the XX century by a French scholar François Perroux (Parr, 1999a; Serra, 2003). Perroux’s main idea was that growth occurs unevenly in economic space; it tends to concentrate in certain areas (poles, points etc.); later thanks to “spreading mechanisms” it covers the remaining areas (Perroux, 1970; Ukrainskiy, 2011). Jacques Boudeville and a number of subsequent scholars transformed a concept by moving “growth poles” from abstract economic space to geographic space; it made a noticeable contribution to the possibility of practical implementation of growth pole theory in territorial management (Boudeville, 1966; Parr, 1999a). Papers such as (Aydalot, 1965; Darwent, 1969; Lasuen, 1969) have also provided a theoretical basis of the theory.

1.2.2. Growth Pole Theory: Main Contributors and Ideas

We propose, upon regarding (Granberg, 2004; Serra, 2003; Parr, 1999a; Richardson, 1975; Thomas, 1975), that an evolution of growth pole theory would be presented in a following sequence (*see Table 1*).

Table following on the next page

Table 1: Growth Pole Theory: Main Contributors and Ideas

Decade	Main Contributors	Main Idea
1950s	Perroux	Growth poles as attraction areas for economic growth in abstract "field of forces".
1960s	Perroux, Boudeville, Aydalot, Darwent, Lasuen, Pottier	Development poles and growth poles in geographical space. Axes of growth as mechanisms of spreading growth.
1970s	Parr, Richardson, Thomas	Growth pole spillovers and growth-pole-induced technological change in regional economics.

From then on, theory itself is considered relatively formed – papers are devoted not to developing theory but to its critical understanding. Some scholars, like e.g. (Cristea, 2013), seek to classify growth poles; some compare it to other spatial concepts (Ukrainskiy, 2011; Akpadock, 1993). But main amount of papers deals with practical experience of implementing growth pole strategy. Among such contributions is an abovementioned paper by J. Parr (Parr, 1999a; Parr, 1999b).

1.2.3. Critical Understanding of Growth Pole Theory: John Parr's Contribution

British scholar John Parr in (Parr, 1999a; Parr, 1999b) summarises practical aspects of implementing growth pole theory in both developed and developing countries during the XX century. He expresses, in particular, his view on the following points:

- theory's framework (Parr, 1999a);
- objectives for implementing the strategy: reviving a depressed area; encouraging regional deconcentration; modifying the national urban system; attaining interregional balance (Parr, 1999a);
- characteristic features of the strategy (*see paragraph 2.1 of the present paper*) (Parr, 1999a);
- external effects of growth poles (positive, negative and neutral) (Parr, 1999b);
- reasons for strategy's failure (mainly caused by poor understanding of its nature) (Parr, 1999b).

John Parr's article, being written in 1999, deals, rather obviously, with practical experience accumulated during the XX century. He identifies four stages in history of growth pole strategy implementation and comes to conclusion that the last one (mid 1970s – 1999) is the stage at which strategy is generally rejected. At the same time, practical evidence accumulated since the beginning of the new century suggests that growth pole theory may have seen its revival – there are several examples of quite successful establishing of growth poles in different countries. Hence our main hypothesis is that first two decades of XXI century may present a new stage (stage of revival) of growth pole strategy, with several countries giving it "a second wind". In the next paragraph we are going to examine and analyse that experience (see Figure 1).

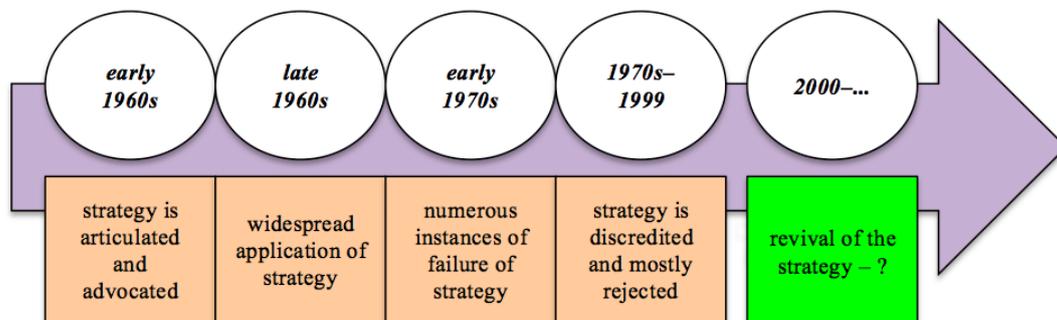

Figure 1: History of Growth Pole Strategy Implementation: John Parr's Point of View and Authors' Hypothesis

2. PRACTICAL EXPERIENCE OF ESTABLISHING GROWTH POLES: XXI CENTURY

2.1. Characteristic Features of the Strategy

John Parr (Parr, 1999a) defined following features as characteristic of any growth pole strategy:

- “encouraging the growth of employment and population within a region at particular locations or planned poles over some specified period” (Parr, 1999a);
- “a definite limitation on the number of locations or centres which are designated as planned poles” (Parr, 1999a);
- “spatial discrimination or selectivity among locations” (Parr, 1999a);
- “a modification of the spatial structure of employment and population within a region” (Parr, 1999a).

Through analysis of the latest literature on the topic we have allocated some other features that may be as well regarded as those characteristic of growth pole strategy:

- growth pole is “an attractive centre for production and service sector” (Toy et al., 2016);
- basic principle is “to support predetermined strategic projects in order to benefit effectively from limited financial source” (Toy et al., 2016);
- growth poles “increase market size so that it becomes profitable for firms to invest” (Speakman et al., 2013);
- “the focus... is on externalities and doing many things at the same time to achieve critical mass” of effects (Speakman et al., 2013).

2.2. Examining Practical Evidence

We have searched for evidence of growth pole theory application to economic systems management according to following criteria:

- growth poles (centres) were created and (or) started to function not earlier than year 2000;
- growth poles were planned (induced) ones – with accordance to Parr’s terminology (Parr, 1999a);
- mechanisms and certain outcomes of establishing growth poles were described;
- the project has been already functioning at least for some period of time so results could be assessed.

As a result we can discuss the experience of seven countries: France, Turkey, Madagascar, Greece, Romania, Norway, Nigeria. Table 2 summarises the results of our research: practical experience of each country is described through a set of characteristics.

Table following on the next page

Table 2: International Experience of Establishing Growth Poles in XXI Century

Characteristics	France	Turkey	Madagascar	Greece	Romania	Norway	Nigeria
Year(s)	2004-pres. (a).	2014-pres.	2004-2013.	2000-pres. (first stages since 1990s).	Two stages: 2008-2013, 2013-pres.	2002-2003.	1999 (first results in 2000)-...
Previous Experience of Growth Pole Strategy	Unsuccessful (d).	Unsuccessful.	None.	Unsuccessful.	None.	Unsuccessful.	None.
Main Objectives of the Strategy	Improving cooperation between business, research institution and state (c).	Decreasing "the differences in socioeconomic development between regions".	Improving business environment.	"Decentralization of development" and "upgrading of the development role of urban centres".	"Increasing the quality of life" and "rehabilitating the urban infrastructure".	Not stated.	"Providing employment possibilities in rural locality".
Financing	Private and public (e).	Public investment program (central budget).	Private-public partnership projects.	Public (state funds along with EU sources).	Public (state funds along with EU sources).	Private-public partnership with a special support from global companies.	Public (central budget).
Hierarchy of Growth Poles	National and international level growth poles (b).	None.	None.	Four-level complex hierarchy.	Growth poles (national) and urban development centres (regional).	None.	None.
Criteria for Determining a Growth Pole	Innovative firms and industries with an ability to become a center of clusterization (c).	Cities with certain population and certain labour force structure, situated in less developed east of the country, and hosting specific infrastructure objects.	Not stated.	Population size; necessary infrastructure, "operation of one or more propulsive activities"; geographical position; administrative significance.	Detailed set of criteria implemented via threshold-system.	None.	None.
Outcomes	Increase in GDP, GRP, new innovative businesses, increased international cooperation (c).	Certain increase in GDP, GRP.	Increase in investment, number of businesses, jobs; better business environment.	Increase in GDP, GRP and both local and regional cooperation.	Increase in GDP, GRP and some other monetary flows.	Extensive renovation process; significant improvement in local employment; growth in population etc.	Shift in labour market structure; creating new infrastructure; overall "enlightenment in community".
Main Difficulties and Negative Effects	Not stated.	Weak financing and not enough motivation of regional authorities.	Some projects regarded less successful.	Different planning programs with different approaches and definitions along with absence of required supplementary policies.	(During 1 st stage:) no clear "understanding of how the designated growth poles can contribute to the general development of Romania".	No effective integration between regional and higher level companies; no effective networks or clusters were created.	Increased crime rate.
Source(s) of Information	(a) – (Perrat, 2007); (b) – (Speranskaya, 2007); (c) – (Les Pôles de Compétitivité, 2014); (d) – (Ukrainskiy, 2011) (e) – (Teplova et al., 2009).	(Toy et al., 2016).	(Speakman et al., 2013).	(Christofakis et al., 2011).	(Growth Poles: The Next Phase, 2013; Cristea, 2013).	(Eikeland, 2014).	(Ehinmowo, 2010).

Note: GDP – gross domestic product; GRP – gross regional product.

Upon analyzing the experience we may produce several conclusions:

- the experience is mostly regarded as a positive one (there always was a certain increase in monetary and non-monetary socio-economic indicators), though, in all the cases policymakers faced certain challenges (most of them connected with poor financing and poor cooperation between actors);
- in most of the cases country has a previous experience of implementing a growth pole strategy – and always not a positive one;
- not all the objectives were achieved (objectives were mostly connected with decentralisation, improving infrastructure and providing employment), but the massive amount of positive outcomes usually was regarded as a sign of the strategy's success;
- main difficulties are connected with weak financing, weak policy-making (e.g. lack of supplementing policies) and ineffective feedback mechanisms;
- main positive outcomes are connected with increase both in monetary (GDP, GRP, income) and non-monetary (e.g. quality of life, level of education, new labour market possibilities) indicators;
- public investment (including, e.g. EU-level programs) seems to be the main source of financial support but private sources are equally desirable (with the possibility of creating private-public partnerships);
- growth poles are mostly cities (urban development centres) of certain size hosting specific infrastructure objects; the actual size and other criteria depend on the level of growth pole hierarchy;
- in the XXI century the strategy was implemented in European (5) and African (2) countries, both developed (2) and developing (5).

3. GROWTH POLE AS AN INTEGRAL PART OF THE STRATEGY FOR SPATIAL DEVELOPMENT

3.1. Strategy for Spatial Development

Regarding the positive experience of countries in XXI century we propose that the growth pole strategy may become an integral part of a strategy for spatial development in nations that face similar problems, that being: intra- and interregional differences in terms of monetary (financial flows) and non-monetary (quality of life) indicators (The World Bank, 2018). The recent examples of such strategies are EU-level strategies:

- The European Regional/Spatial Planning Charter (Council of Europe, 1984) “portrays ‘regional/spatial planning’ as giving geographical expression to the various policies of society; giving direction to a balanced regional development and the physical organization of space, according to an overall strategy” (Faludi et al., 2012; Council of Europe, 1984);
- one of the features of European Spatial Development Perspective is an advocacy of polycentrism (Faludi, 2006), which may be connected with growth pole strategy;
- Europe 2020 is “a strategy for smart, sustainable and inclusive growth” (Marlier, 2010) giving a certain importance to spatial cohesion (Growth Poles: The Next Phase, 2013).

3.2. Growth Poles, Smart Region and Clusters

The strategy for spatial development shall not rely only on one theory: growth pole concept shall be a part of the strategy along with other spatial development concepts for the multi-conception strategy having better chances of being successfully implemented. We propose that these other concepts may be the following ones:

- smart region concept, which relies on “expanding the concept of “urban smartness” from the usual scale of buildings or urban projects to the regional dimension” (Morandi et al., 2016; Garau, 2015);

- cluster policy, the concept of which “focuses on the linkages and interdependencies among actors in production chain... and innovating” (Roelandt et al., 1999).

Figure 2 shows how the abovementioned concepts may be combined.

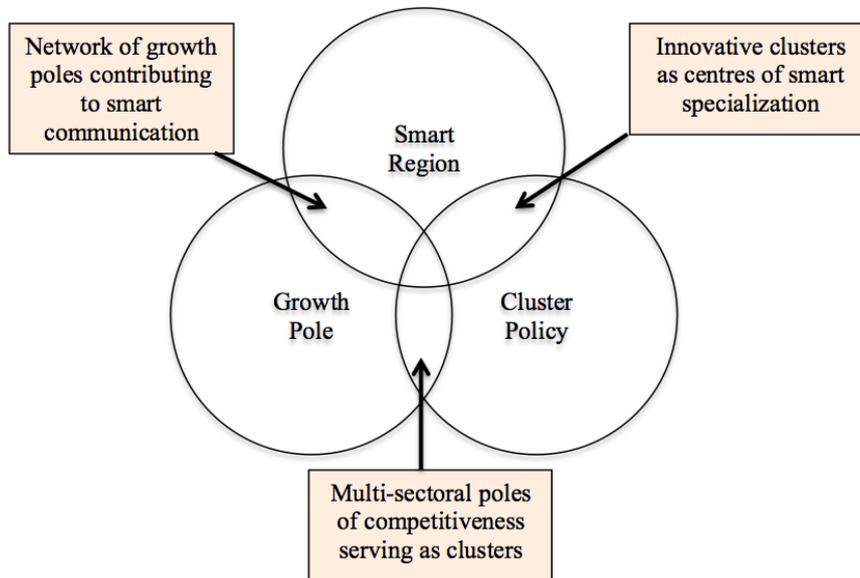

Figure 2: Growth Poles, Smart Region and Cluster Policy in the Strategy for Spatial Development (intersection of three circles presents a spatial strategy itself as a combination of three spatial development concepts)

4. CONCLUSION

We have analysed the evidence from both developed and developing European and African countries in implementing the growth pole strategy to territorial management in XXI century. Whereas the XX century has seen many examples of rejecting a strategy (Parr, 1999b), the experience of the first decades of the XXI century seems to be something different. In all the cases examined by us the strategy had positive outcomes. The beginning of the XXI century may become a new stage in a history of implementing a growth pole theory to regional planning, serving as a period of its revival. The strong and detailed policies on several levels (national, regional, local) relying on growth poles along with other spatial development concepts may become powerful instruments of smoothing intra- and interregional differences in terms of monetary (financial flows) and non-monetary (quality of life) indicators.

ABSTRACT

In the context of modern globalization and economic integration financial control is one of the key components for the implementation of important areas of public administration and state policy, which not only serves as the mechanism for carrying out the verification of the accuracy of the financial documenting process, detection of violations in fiscal legislation and financial discipline and notification of such cases, but also as an important instrument for the management of finances and economic processes through it. Financial control is a control system of legislative and executive authorities over all financial entities, i.e. financial activities of the government, enterprises and organizations. Its purpose is to ensure the successful implementation of the state's economic policy, help shape financial resources in all spheres of the national economy and effectively utilize them. Since the importance of financial control has increased dramatically in the modern day, the importance of financial control is also rising considerably. Financial control is a dynamic process that always has new features, and therefore it should hold a firm and decent place at the research object of the science of economics in the long term regardless of the degree of knowledge, especially in transition economies. Financial control is both a crucial part of financial management and a prerequisite for the effectiveness of financial system governance. Under current conditions, organization and implementation of effective state control over a deeper study of the general issues of financing budget expenditures, budget formation and particularly use of budget funds, including the role of financial control in increasing the efficiency of use of budget funds has not been sufficiently studied. This issue is particularly relevant in terms of efficient use of budget funds, improving the quality of governance in the budget sphere and the transition to international standards of budget formation and execution. The article studies and classifies the factors influencing the effectiveness of the state financial control on budget expenditures, and provides directions for enhancing the role of financial control in improving the effectiveness of the use of budget funds. The results obtained from the study provide an objective basis for the assessment of financial control in increasing the efficiency of budget expenditures.

Keywords: *budget funds, efficiency, financial control, modern globalization*

1. INTRODUCTION

The solution of the problem of financial control development makes essential the formation of the state financial control system, which allows to project and implement the mechanism of allocation of state resources to top priorities for society, manage state expenditures, improve supervision, develop various levels of state financial control bodies based on international standards and regulate the interaction between them. It should be borne in mind that financial control is a dynamic process that always has new features, and therefore it should hold a firm and decent place at the research object of the science of economics in the long term regardless of the degree of knowledge, especially in transition economies. Since the importance of financial control has increased dramatically in the market economy, the importance of financial control is also rising considerably. Unlike the administrative domination system, the economic functions of the state in the market economy that are based on the principles of democratic governance are significantly restricted, which stimulates economic freedom, but the acquisition of such freedom should by no means lead to arbitrariness and harmful results.

Therefore, in the context of new economic relations, the importance of the state control over the economy is increasing. Being based on the constitution and relevant legislation, the purpose of the state financial control, which is one of the main forms of financial control, is to directly control the implementation of the state's financial policy, ensuring financial stability in the country, and establishment and use of the state budget and extra-budgetary funds. Currently state financial control is exercised by legislative and executive bodies of the country, financial and tax authorities, treasury system and other state bodies. Treasury and tax authorities play a very important role among those bodies. The financial control system carries out state financial control over the purposeful and efficient spending of the state budget, and extra-budget funds of the purposeful budget funds and budget organizations, as well as the loans received under state guarantee. The state financial supervision is also carried out by control and inspection offices, chief accountancies and financial departments of separate ministries and committees. We believe that there is a need for the restoration, renewal and improvement of the old control system at the stage of globalization of economic development. Improving financial control should, first and foremost, involve the organization and functioning of the most up-to-date controls, the coordination of the control system and increasing its impact.

2. LITERATURE REVIEW

Many world scholars have applied to the study of financial supervision and control over execution of the state budget. The state budget mainly serves to finance the public sector in the economy, which produces public goods and services. The public sector provides a lot of significant services to the community (McKenzie, 1988). It acts as an over-compensating function. That is, it does things that the market economy can not effectively do or does not have enough stimuli to implement. Musgrave and Musgrave (1976) have classified the functions of the public sector as follows:

- resource allocation – provision of social benefits and services;
- income distribution – regulation of wealth or income distribution in society to comply with the principle of fairness;
- stabilization – use of tax policies to achieve high employment, price stability and economic growth.

Delving into the issue of financial control, Oshisami and Dean (1984) argue that since financial supervision is the basis of political power, the control over finances should be reflected in the constitution of all countries in order to prevent the possibility of abuse. In general, the term "control" is one of the basic principles of governance. Control contributes to the efficient utilization of resources to achieve the objectives set out in the defined plan (Lucey, 1996, Ekwonu, 1996). Koontz, Donnel and Wiehrick (1980) also define control in a similar way – as a means to measure and correct the activity of the subordinates in order to ensure that such activity is consistent with the plan. At the same time, they have divided the financial control into three stages: defining standards; determining the quality of the use of such standards; aligning deviations from standards and plans (Koontz, Donnel and Wiehrick, 1980). Financial control is one of the basic and essential types of control in the field of public finance management. Financial control ensures economical and efficient use of financial resources taken at real value in order to achieve the assigned goals more effectively (Oshisami, 1992). Ball et al (1999); Bartel (1996); Asselin (1995); Premchand (1989); Hogye (2004); Martinez - Soliman (2003); Sahgal (2001) and Ahsan (1994) stated in their studies that in order to increase the efficiency of financial control over public funds the financial supervision institution must be isolated from other administrative institutions, in other words, it should be an independent institution. Financial management is as old as the government (McKinney and Howard, 1979). It is one of the main functions of managing the state, which carries the leader towards the

society. In addition, it is the only function that affects every servant. There is a link between financial transparency and the required level of management (Sutcliffe, 2002) and financial transparency positively affects macroeconomic stability (Idasa, 1998). In particular, in order for effective budget control and regulation of monetary transactions, the government should have a proper working accounting and reporting system (Asselin, 1995). Finances and financial control are closely linked to the state budget. The state budget plays a significant role in government management and planning (Mckenzie, 1998). Each government decision has a budgetary nature. In particular, the decision-making process pretty much entails allocation of scarce resources to alternative uses (Stedry, 1979). The state budget is a financial plan covering government spending and the sources of funding thereof (Mckenzie, 1998), or the most valuable and authoritative project or map of resource allocation (Pollack, 1999). The budget is a process that reflects the purpose and expenditure of financial resources over a period of time (Akinolaand Asein, 1998). The budget is a plan of spending an amount and/or monetary value for a future period. It usually demonstrates planned or targeted income and the planned or targeted costs (Pogue, 1989). The importance of budgeting is increasing with increasing demand for power distribution between legislative and executive bodies (McKinney and Howard, 1979, Premchand, 1989 and Wapmuk 2001). The budget acts as a bridge between legislative and executive bodies (Wildavsky, 1979). Budget is the only and most important manifestation of government policies that provide for the implementation of programs and plans set by the government's legal entities. It is also a control tool for the parliament and a key guiding document that represents the responsibility before the taxpayers. Budgeting is a dynamic and continuous process. It is a cycle and it has four phases: planning and preparation, legislative review, execution and audit (McKinney and Howard, 1979 and Hendrick and Forrester, 1999). The execution of each budget is also an executive responsibility (Burkhead, 1959). Financial control over the use of budget funds is absolutely necessary. Spending of the allocated financial resources for the intended purposes and the legitimate activities of funds are checked during financial control (Knighton, 1979). At the same time, due to the expenditure limitation, financial control focuses on full compliance of spending with the expenditure plan and efficient use of financial resources. The distribution of financial resources plays an important role in fulfilling the functions by the political authorities. For this reason, supervision in accordance with the norms is not only important to guarantee the effective utilization of public funds, but also to force the government and the authorities in general to be responsible in their actions (Speck, 2003). The role of financial reporting in financial supervision is expressed as a key element of the responsibility of public institutions (Henley et al., 1993).

3. DATA AND METHODOLOGY

The data have been collected from the State Statistical Committee and the website of the Ministry of Finance of Azerbaijan. There are numerous established and stable relations between various economic indicators in economics. The dependences between the economic indicators in economic systems are not functional, they are correlation type dependences. Detection, evaluation and analysis of such dependences, including the construction of mathematical expressions of dependences and assessing their parameters are one of the key sections of econometrics. If a change in one of the economic indicators will lead to a change in the distribution of the other, then such dependency is statistical and it is called correlation dependence. This type of dependence is expressed as:

$$M(y/x) = f(x) (I)$$

and is called regression function of Y on X. In this case, X is a non-dependent variable or regressor, and Y is a dependent variable.

Research is called double regression when learning the dependence of two RDs. Based on the above considerations, it can be concluded that the linear regression (theoretical linear regression equation) means the linear function of the dependent variable y between x . The expression:

$$Y = \beta_0 + x\beta_1 + \varepsilon_i \quad (2)$$

is called the theoretical linear regression model; β_0 , β_1 are the theoretical parameters of the regression (theoretical ratios) and ε_i is the random displacement.

4. CURVE MODELS

One or more different models for the evaluation of the curves can be chosen. Curves can be selected according to the data distribution, scatter graph. But at the same time, the attention is mainly focused on the compliance and reliability features of the statistical indicator model when finding the parameters with the least squares method (LSM). The adapted R-squared indicates the model's accuracy, and its value is between 0 and 1. The accuracy of the calculation increases as the result approaches 1. t-statistical measures the significant volatility of the model. It specifies the degree of compatibility of the variable to the model. t-statistical should be greater than 2, so that the coefficient is considered a reliable indicator. A greater t-statistical indicates that the variable is more significant in the equation. F-statistical indicates the accuracy of the equation used in model. A greater F-statistical means a more reliable model. F-statistical should be greater than 4 for the model to be considered acceptable. The probe (F-statistical) indicates the probability that the model is wrong.

The following equation models are available.

Linear	–	$Y = b_0 + (b_1 * X)$	where b_0 is a constant, b_1 is regression coefficient for free X . The range is modeled as X linear function
Logarithmic	–	$Y = b_0 + (b_1 * \ln(X))$	where $\ln()$ is a natural logarithmic function
Inverse	–	$Y = b_0 + (b_1/X)$.	
Quadratic	–	$Y = b_0 + (b_1 * X) + (b_2 * X^{**2})$	where $**$ is the exponentiation operator. If b_2 is positive, then the curve is rising, if it is negative, the curve is downsloping. Can be used for modeling of increasing or decreasing ranges.
Cubic	–	$Y = b_0 + (b_1 * X) + (b_2 * X^{**2}) + (b_3 * X^{**3})$	If b_3 is positive, then the curve is rising, if it is negative, the curve is downsloping.
Exponentiation	–	$Y = b_0 * (X^{**b_1})$ or $\ln(Y) = \ln(b_0) + (b_1 * \ln(X))$	If b_0 is positive, then the curve is rising, if it is negative, the curve is downsloping.
Power	–	$Y = b_0 * (b_1^{**X})$ or $\ln(Y) = \ln(b_0) + (\ln(b_1) * X)$	If b_0 is positive, then the curve is rising, if it is negative, the curve is downsloping.
S-shaped	–	$Y = e^{**}(b_0 + (b_1/X))$ or $\ln(Y) = b_0 + (b_1/X)$	where e is the basis of natural logarithm. If b_1 is positive, then the curve is rising, if it is negative, the curve is downsloping.

Logistic	– $Y = 1/(1/u + (b_0*(b_1**X)))$ or $\ln(1/y-1/u) = \ln(b_0) +$ $(\ln(b_1)*X)$	where u is the upper boundary, limit of the price, the indicator. If b1 is negative, then the curve is rising, if it is positive, the curve is downsloping.
Growth	– $Y = e**(b_0 + (b_1*X))$ or $\ln(Y) = b_0 + (b_1*X)$	If b1 is negative, then the curve is downsloping, if it is positive, the curve is rising.
Exponential	– $Y = b_0* (e**(b_1*X))$ or $\ln(Y)$ $= \ln(b_0) + (b_1*X)$	If b1 is negative, then the curve is downsloping, if it is positive, the curve is rising.

5. CURRENT STATE OF STATE BUDGET EXPENDITURE UTILIZATION IN AZERBAIJAN

Increasing budget revenues and optimizing expenditure are important macroeconomic priorities of all states. In the current systemic crisis, these issues, particularly the efficient, cost-effective and effective use of state budget expenditures, are of particular importance. In the medium and long term, in order to optimize the budget framework and increase tax revenues from the non-oil sector in the overall structure of budget revenues in Azerbaijan, it is important that the fiscal sustainability issues are assessed in the context of the overall macroeconomic framework, as well as by taking into account the principle of unchangeable real costs defined in the “Long-term strategy on the management of oil and gas revenues”. It would also be a positive step to use the fiscal gap indicator to estimate the actual long-term view of the economy in terms of natural resource dependency. This parameter is an indicator of the ratio that is calculated by taking into account priorities of the current and future fiscal policy on the long-term and bringing to the real value between the review and the revenue and expenditure of the state budget. This indicator is appropriate for measuring fiscal sustainability. The global financial crisis does not shy away from Azerbaijan, which is closely integrated into the global economic system. Measures taken in Azerbaijan with regard to financial control provide maximum protection against these variables. Normalization of some costs in the budget, strengthening of financial administration and a more responsible approach are the main principles of an efficient and cost-effective approach to the use of public funds. And serious financial discipline and purposeful saving are financial sources too.

Table 1: State budget revenues

	1995	2000	2005	2010	2011	2012	2013	2014	2015	2016	2017
Total revenues	316.9	714.6	2055.2	11403.0	15700.7	17281.5	19496.3	18400.6	17498.0	17505.7	16516.7

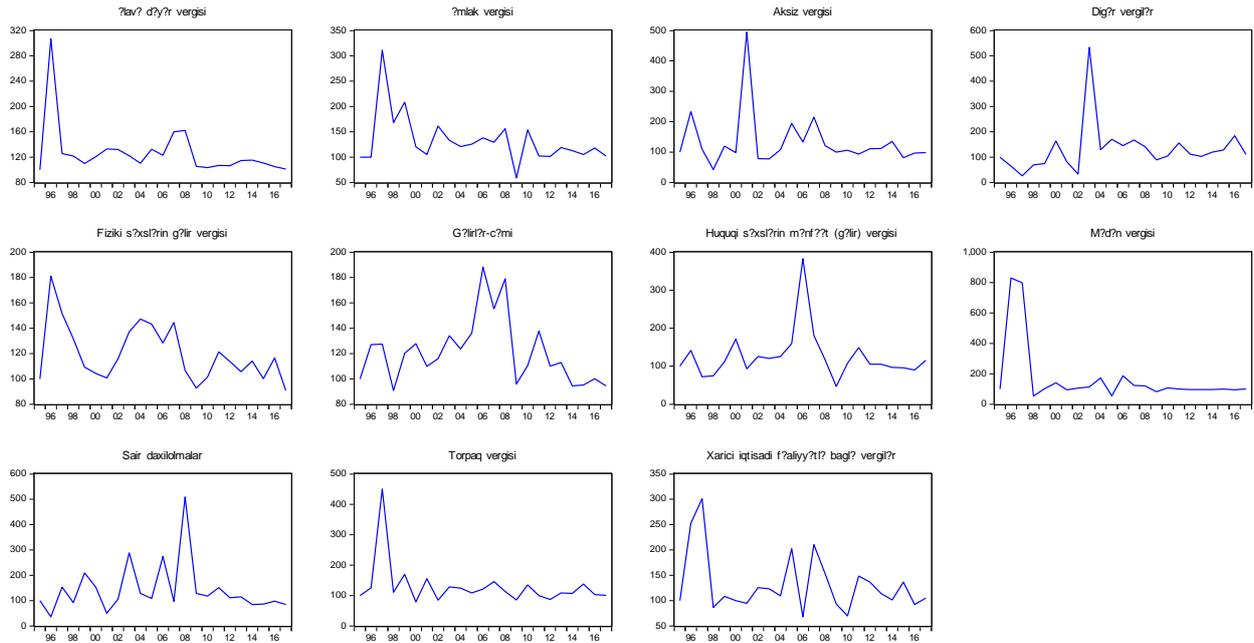

Figure 1: Dynamics of state budget revenues (relative to previous year)

The revenues of the state budget for the studied period of 1995-2017 have increased by 52.12% to 16516.7 million manats. Total revenues have increased by 23.11% in 2017 compared with 2000, 8.03% in comparison with 2005, and 1.49% in comparison with 2010, whereas they have declined by 15.3% in comparison with 2013, 5.6% in comparison with 2015, and 5.5% in comparison with 2016. Similarly, this situation is observed in all revenue sources.

Table 2: State budget expenditures

	1995	2000	2005	2010	2011	2012	2013	2014	2015	2016	2017
Total expenditures	428.4	764.0	2140.7	11765.9	15397.5	17416.5	19143.5	18709.0	17784.5	17751.3	17538.0

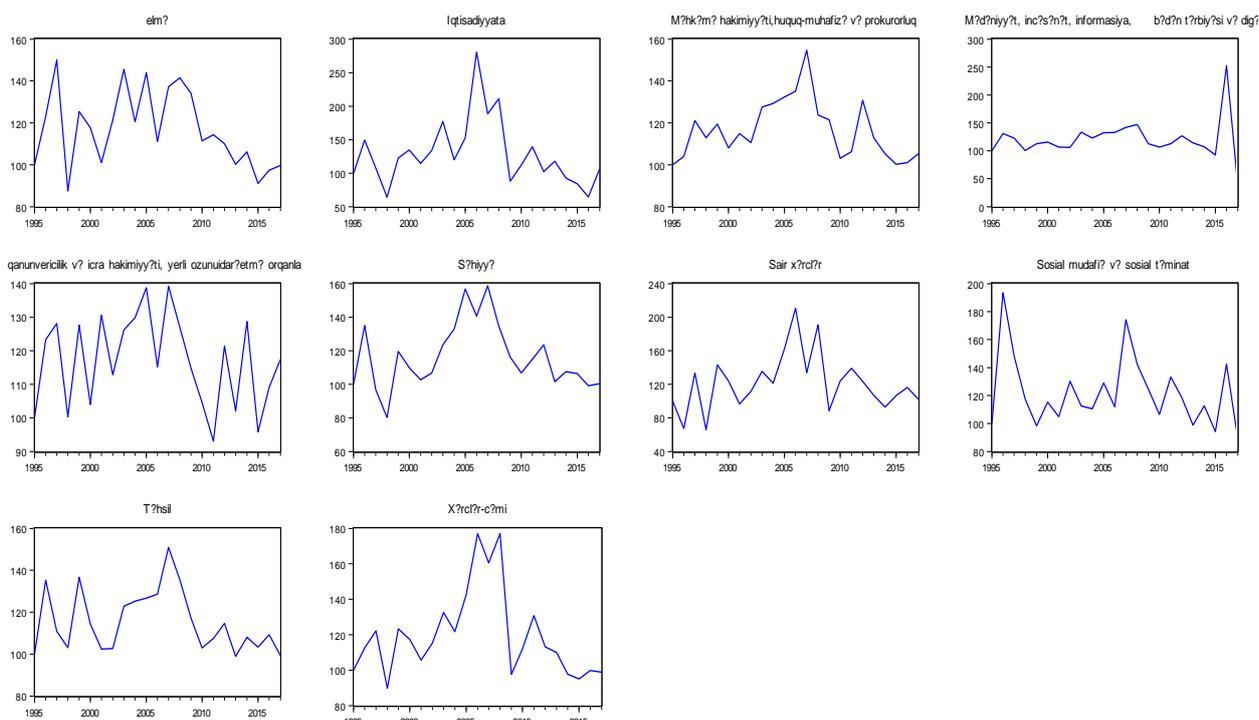

Figure 2: Dynamics of state budget expenditures (relative to previous year)

The expenditures of the state budget for the studied period of 1995-2017 have increased by 40.93% to 17538.0 million manats. Total expenditures have increased by 22.95% in 2017 compared with 2000, 8.19% in comparison with 2005, and 1.49% in comparison with 2010, whereas they have declined by 8.2% in comparison with 2013, 1.5% in comparison with 2015, and 1.1% in comparison with 2016. Similarly, this situation is observed in all revenue sources.

6. ECONOMETRIC ANALYSIS

Based on the results calculated with the PASW Statistics 18 and EViews 9 software packages, the following time dependent models of the state budget expenditures have been obtained.

$$\begin{aligned} \text{Total expenditures} \quad Y = & 4743.48 - 2495.28x + 306.36x^2 - 7.46x^3 \\ & (3,083) \quad (-4.593) \quad (5.890) \quad (-5.230) \quad (1) \\ R^2 = & 0.963 \quad F = 168.837 \end{aligned}$$

$$\begin{aligned} \text{Expenditures on the} \quad Y = & 2710.79 - 1548.86x + 190.61x^2 - 5.19x^3 \\ \text{economy} \quad & (2.700) \quad (-4.368) \quad (5.615) \quad (-5.571) \quad (2) \\ R^2 = & 0.899 \quad F = 56.816 \end{aligned}$$

$$\begin{aligned} \text{Education} \quad Y = & 294.95 - 125.68x + 17.73x^2 - 0.41x^3 \\ & (3.445) \quad (-4.156) \quad (6.125) \quad (-5.193) \quad (3) \\ R^2 = & 0.983 \quad F = 381.326 \end{aligned}$$

$$\begin{aligned} \text{Healthcare} \quad Y = & e^{(2.888 + (0.179x))} \\ & (19.983) \quad (16.983) \quad (4) \\ R^2 = & 0.932 \quad F = 288.439 \end{aligned}$$

$$\begin{aligned} \text{Social protection} \quad Y = & e^{(3.819 + (0.188x))} \\ \text{and security} \quad & (38.469) \quad (26.068) \quad (5) \\ R^2 = & 0.983 \quad F = 56.816 \end{aligned}$$

$$\begin{aligned}
 &\text{Activity in the field} & Y &= e^{(2.023 + (0.183x))} \\
 &\text{of culture, art,} & & (17.798) \quad (22.098) \\
 &\text{information,} & R^2 &= 0.958 \quad F=488.334 \\
 &\text{physical education} & & \\
 &\text{and other categories} & & \quad \quad \quad (6)
 \end{aligned}$$

$$\begin{aligned}
 &\text{Science} & Y &= 29.989 - 15.01x + 1.98x^2 - 0.05x^3 \\
 & & & (3.400) \quad (-4.816) \quad (6.625) \quad (-6.187) \\
 & & R^2 &= 0.969 \quad F= 199.216 \\
 & & & \quad \quad \quad (7)
 \end{aligned}$$

$$\begin{aligned}
 &\text{Judicial power, law} & Y &= 186.48 - 85.32x + 11.11x^2 - 0.23x^3 \\
 &\text{enforcement and} & & (3.333) \quad (-4.318) \quad (5.875) \quad (-4.565) \\
 &\text{prosecution} & R^2 &= 0.985 \quad F= 417.391 \\
 & & & \quad \quad \quad (8)
 \end{aligned}$$

$$\begin{aligned}
 &\text{Supporting} & Y &= e^{(2.811 + (0.165x))} \\
 &\text{legislative and} & & (31.628) \quad (25.518) \\
 &\text{executive} & R^2 &= 0.968 \quad F=651.192 \\
 &\text{authorities, local} & & \\
 &\text{self-government} & & \\
 &\text{bodies} & & \quad \quad \quad (9)
 \end{aligned}$$

$$\begin{aligned}
 &\text{Other expenses} & Y &= 1023.11 - 510.77x + 58.61x^2 - 1.13x^3 \\
 & & & (2.599) \quad (-3.674) \quad (4.405) \quad (-3.109) \\
 & & R^2 &= 0.979 \quad F= 240.525 \\
 & & & \quad \quad \quad (10)
 \end{aligned}$$

Note: t-statistic is shown in brackets.

Statistical indicators show the model's compliance and reliability. The adapted R-squared indicates the model's accuracy, and its value is between 0 and 1. The accuracy of the calculation increases as the result approaches 0. 0.899-0.985 adapted R-squared means 89.9% to 98.5% of the change is explained by the change in the economic indicator. t-statistical measures the significant volatility of the model. It specifies the degree of compatibility in the model. t-statistical should be greater than 2, so that the coefficient is considered a reliable indicator. A greater t-statistical indicates that the variable is more significant in the equation. F-statistical indicates the accuracy of the equation used in model. A greater F-statistical means a more reliable model. F-statistical should be greater than 4 for the model to be considered acceptable. The probe (F-statistical) indicates the probability that the model is wrong. Models were chosen on this basis.

7. CONCLUSION

Efficient and cost-effective use of budget funds is one of the substantial modern-day fiscal requirements. Proper planning and effective execution of state budget expenditures also requires improvement of the normative base in this field. Improvement and unified coding of the existing regulatory and legal acts governing the state financial control and financial and budgetary system will serve to solve problems and improve performance in both areas. Coding of a legal framework that regulates broad-based activities is the most common approach and is characteristic of the top stage of development. Nearly twenty codes are valid in Azerbaijan and these codes successfully ensure implementation of multisectoral activity in the relevant field in a flexible and coordinated manner. From this point of view, the adoption of the Budget Code will ensure both budgetary processes that are the main financial operations, and the regulation of the control over those operations as a single complex.

NEW APPROACH TO MANAGEMENT EDUCATION IN THE POST-SOVIET STATES

Kamil Shahbazov

Azerbaijan State University of Economics (UNEC)

kshahbazov@mail.ru

ABSTRACT

Globalization and the rapid implementation of innovations in management processes have fundamentally changed the approach to management education. The need to train modern creative managers is triggered by the needs of business organizations and government agencies. In fact, in the post-Soviet states, the transition to a capitalist management system was completed, but the methods of managing the economy stayed mostly administrative. At the same time, the peculiarity of the development of separate states is so individual and multifactorial that it is impossible to formulate a single recipe for increasing the relevance of management education. Management as the most relevant science of our time, cannot be unified for all states, and the use of its methods, principles, functions very much depends on the mentality of the people, its culture, history, and the characteristics of the ethnogenesis of the nation. The changes that are occurring with a cosmic speed in Azerbaijan dictate an increase in the requirement for the training of modern managers, the changes of our education with the world's leading educational institutions. Therefore, the main task of management today in the country is the study of methods and ways of adapting innovation management to the real economy. If these modern challenges are not realized, Azerbaijan will not stand the competition. Therefore, the task of innovation management is a rapid breakthrough in managing the process of introducing new technologies into the economy and training progressive managers. The paradigm of the new millennium is becoming knowledge, increasing the productivity of mental labor, mastering the methods of its measurement. All this is completely related to management education. Consequently, the training of creative managers should be based on new educational standards, which provide for a completely new approach, involving the creation of a unified system. State, business and universities. This social triangle is a necessary condition for the development of society. Management education should be based on new modern learning technologies. The learning process itself must be synthesized with real practice. In the context of globalization, the pace of changes in economic processes, the replication of innovative novelties, their application in the production sector with the intensification of innovation activity on a qualitatively new basis are undoubtedly accelerating throughout the world. In fact, this is the "positively charged" effect of globalization, which allows an ever-increasing number of countries to benefit from innovative achievements, advanced technical standards and new management practices. According to forecasts, the growth of the world economy in the short and medium term future will occur as a result of the influence of this particular factor. The problems of education are firstly the preparation of highly qualified, specialized managers; secondly, the mass involvement of students in the process (through the start-ups) of creating innovative products that can withstand competition. The role of the state, in this case, is a) to coordinate the activities of start-ups, the creation of technoparks and technopolises; and b) economic incentives for their activities. It seems expedient to create integrated technoparks based on the synthesis of business ideas and resource opportunities. Modern information technologies allow solving this problem. At the same time, in this case, the problem of human capital development will be solved, the main indicator of which is education. Changes that occur in the training of managers require its cooperation by modern world universities.

Keywords: *business idea, innovation, management, start-up*

1. INTRODUCTION

The formation of market management methods requires a substantial reorganization of the system of personnel training in modern types of organizations and a completely new approach to managing new conditions. The developmental characteristics of individual countries are so unique that they can not formulate a single global recipe for the relevance and effectiveness of education. It is convincingly proven that one of the rapidly developing sciences is unequivocal for all states and it is impossible to reflect mentality, culture, history and traditions of different peoples. Changes in the education system of Azerbaijan, especially in the field of contemporary innovation and creative managers, require accurate clarifications based on the experience of the world's leading universities. We strongly condemn such an idea that the modernization of the country's economy is impossible without new creative thinking managers. As in other post-Soviet countries today, the main task of management in our country is to study the problem of effective management of innovative management in all spheres of economy. Globalization puts very strict requirements characterized by the fact that everything new to the citizens of the country is very rapidly applied to public life. If society is not adapted to these innovations, it will lose its competitiveness. The purpose of innovation management in Azerbaijan is to achieve a breakthrough in the field of innovative technologies and to achieve an effective and sustainable growth in education. The formation and realization of human capital in the market economy is essentially different from the realization of its socialist economy.

2. CHAPTER 2

At the end of the eighties of the twentieth century and early nineties, effective managers and specialists were primarily knowledgeable and at the same time quite knowledgeable. It was stable from these knowledge, but in the same way as in separate enterprises it required the use of the weaknesses of the country's economy in the planned management system. The pragmatism and the breadth of knowledge, as well as the ability of people to use logical analysis tools were given special value. The ability to produce logical outcomes would be the basis for success in decision-making, as some kind of future would have a logical transformation of the past. This approach to education has completely justified itself. It should be noted that the leading training centers were able to succeed in training such professionals. Graduates of a number of universities and educational centers were well-prepared for their management activities in state bodies and state-owned enterprises. However, the radical changes in the management of the enterprise demanded radical changes in the market economy, which seriously changed everything. If the earlier management strategy focused on the past, relying on past experiences, management in the new context was completely aimed at creating a future, as opposed to the past and present. Instead of logic, intuition and creativity have come. Of course, this can not be perceived as a denial of logical analysis and logical outcomes. They also demanded that all other changes be fully reviewed and addressed by the graduates of the training and retraining department. This, in turn, required the content of the education and teaching methods to be viewed from a new perspective. In our view, this last approach should be considered more important. Education is a combination of the knowledge that this student reflects on the entire educational institution and in particular with teachers and students. More precisely, education is a process of positive changes in the student as a result of a complex interaction with these educational institutions. Education is the process of changing this person. By educating, people change their outlook and acquire new qualities that they did not have before. At present, our republic is trying to make radical and effective changes to the content of the education system. Entry into a completely new education system is not a simple matter, but rather a complicated process that covers all aspects of the public recycling system. If somebody thinks that a change in the education system can be made, it's totally wrong. The education system should be based on modern innovations, using the past experience as a future

development system. Today, there are problems in the labor market and education services interactions. Thus, graduates of educational institutions increase the number of "unemployed" army because the offered specialties do not meet the needs of the labor market. Business-science-education social triangle is a necessary condition for today's development. It is possible to talk about innovation economy within the framework of mutual influence of the business-power-education model. So, it is important to stand on the following issues. First of all, let's look at the distinctive features of management education, and then analyze how students and teachers interact in this type of education and how the teaching process is being implemented. The management education system incorporates the combination of elements and factors of professional managers, as well as elements of training specialists in the fields of economics, finance, accounting, law, social science and other fields that can become potential managers in the future. In the modern management education system, postgraduate education institutions include specialization, modification, retraining and additional education, faculties, business schools, management centers, educational and business centers, etc. is of great importance. Today, Azerbaijan has the right to provide training services to technical universities, even for high schools, in the field of preparation of interesting, but also contradictory, managers, entrepreneurs and businessmen in the field of managerial management. Another observed shortfall is that organizations should create higher education institutions to meet their limited and limited needs, using their favorable capacities. The tendency to tough commercialization of management education, in turn, affects its development in Azerbaijan. Most of the specialists in management, marketing, entrepreneurship and other fields in Azerbaijan are trained on commercial terms. A few words could be said about the distinctive feature of management education. Usually speaking, the conversation is entirely spontaneously understood by the activities of the teaching centers, primarily of their teachers. Teaching means the amount of knowledge, attitudes and habits that a student collects during a conversation with an educational institution, especially with a teacher and other students. To put it more precisely, education means the changes occurring in students (future specialists) as a result of complex interactions in the educational institution. Education (teaching) is a process of changing people. People can change their outlook by learning new things they do not have before. All this changes the reality that people live and operate. Therefore, it is possible to look at the change in the understanding of reality in general education. The main trends of the transformation of the teaching process into new teaching methods are as follows:

- The first is to switch to integrated education in the context of studying the subject rather than learning and examining these key topics, tasks, and individual questions.
- Secondly, focusing on the ability to concentrate on the problem of teaching correct answers to these questions. Real truth does not have the correct answer, regardless of experience. People achieve the results they can achieve by applying certain methods of solving problems.
- Third, the type of passive education that distinguishes the listener, the teacher, the repetitive role of the student, the knowledge, decisions, information and so on. Replacement with the type of education that is active creator.
- Fourth, replacing the teacher with supervision by the teacher in the teaching process.

The teacher defines the rules of the teaching process, and the student controls how the education process is implemented and how the teaching process is carried out. Control is carried out not on the principle of "knowledge-student performance," but on the "principle of the educational process - the degree of achievement of the student". When talking about management education, which is considered to be a particular type of education, it is not entirely enough to agree that it meets the maximum educational requirements of the educational process. It is important to look at the factors that are characteristic of the management education process to describe the

specific features that are relevant to it. One of the most widespread education processes in most types of education is the transfer and acquisition of knowledge. As a result of this process, a certain scheme is scratched at the head of a person. Undoubtedly, education can not be done without this process. However, it should be noted that this process in management education is extremely limited. Thus, this process can not have a major impact on the main results of business education, the attitude and attitude of the educator. At the same time, education is carried out by observing the behavior of others. It is not important to observe the observation in this case. This process can have a significant impact on the student's behavior. This can be more vividly reflected in the context of non-standard original behaviors in a surrounding environment. Such observation facilities are primarily teachers, scholars, famous and well-known professionals. It is a great experience for experiments based on experiments for a number of educational processes. This type of education allows the idea to be formed in practice. Such education does not only help the student to become a reality, but also to create certain habits and skills in the student. A more complex and at the same time a more effective method of education is learning and learning. This type of education is carried out in the form of realistic tasks in real terms, in other words, to the realest possible conditions. In this process, we observe the interaction of all previous educational processes in the process of solving the tasks set up in natural competition. If we talk about management education, then the high effectiveness of action is vastly undeniable. If we try to describe the profile of the past graduate with a course of management education, then it should definitely combine three groups of abilities and qualities:

- the ability to understand the situation;
- definite skills and abilities;
- defined behavior;

Thus, the ability to understand the situation means that the knowledge gained is concentrated on three objects (business environment, people, organization and organizational process). The existence of a certain behavioral pattern is a more important requirement for a graduate who wishes to work in a large business organization that has gone through a curriculum and has a "corporate" culture. This requirement is conditioned by several factors.

- First, the graduate should have a certain level of cultural development. This is to know and understand the history, customs and traditions of the country and people, to adhere to its ethical norms, to know the rules of etiquette and so on;
- Secondly, the graduate must work in the group, in the team, coordinate their interests with their interests, follow the required place, and respect the certain requirements of the team;
- Third, the ability of young professionals to enter into an independent and responsible life has the ability to communicate, to properly understand the meaning of their actions, to use information, to listen and to respond properly to responses;
- Fourth, the graduate must be open to the novelty and be prepared for change;
- Fifthly, the graduate should be responsible for the work, has responsibility and dedication in the organization;
- The sixth should the scope should aspire the graduate to work. If a graduate does not like to work, it will be difficult for him/her to work in harmony with his/her work, especially with the staff involved. Because most of the modern, advanced organizations are characterized by intense labor of its employees.

The core of the new technological structure is the combination of NBIC technologies. The name is an abbreviation of the initial letters of the term "nano, bio, information and cognitive technologies." According to representatives of the US National Science Foundation, which regulates the financing of scientific projects, NBIC technology determines the development of

civilization for the next 50 years (Musaev A., Shevchuk A. Tikha, 2016, p. 44-51). In our country there are indeed shifts aimed at the development of innovations in the industrial sector. Considerable attention is paid by the state to organizing the work of technology parks and start-ups to integrate them into the global innovation community.

3. CONCLUSION

Modern management education is a symbiosis of integrated professional management education and compulsory innovation-intellectual (i.e artificial intelligence) education. Establishment of management schools in our times is crucial. Management schools differ from business schools in their aim and play a major integrating role in society, namely management, its proper organization, bringing high profits to business organizations. Highly professional managers (not politicians) manage economic processes, their knowledge and qualifications guarantee the success of an organization. To solve the problems of modernization of the economy of Azerbaijan following are necessary:

- creation of a new industrial policy aimed at the development;
- creation of an industrial policy management structure;
- active state influence in the processes of technological development;
- effective use of raw materials, human, intellectual and scientific resources;
- creation of sites (clusters) for the successful implementation of the new industrial policy;
- focus on personnel, by creating training programs for qualified personnel to work with advanced technology.

These proposals are crucial for the transition to a new model of economic development, which is associated with the advanced development of industrial sectors and services. The training of qualified personnel can increase the economic efficiency of the industry, help to overcome technological stagnation and make step forward, into a new industrial revolution.

STRUCTURAL MODEL OF ECONOMIC DEVELOPMENT OF AZERBAIJAN: CHALLENGES AND OUTLOOKS

Irshad Karimli

Azerbaijan State University of Economics (UNEC)

irshad.karimli@unec.edu.az

According to its intrinsic logics, challenges of interaction between a production and market, is about the necessity of ongoing channeling of the production to social interests of a human being, as a demiurge of all forms of living process, since the productivity and efficiency of other activities directly depends on the level of its social security. During the period of administrative-command system of the former socialist camp, the development of market relations was hindered by mono-systemic economy, oriented towards the use of a single state property; overburdened regulation of production-economic processes at the macro-level; limited economic freedom of economy at the micro-level; centralized orientation of provision of material and financial resources. These new international subjects faced a challenge to choose a way of how to introduce civil market relations with socially oriented economy. By that time, there was a best international practice of European countries: Germany, Denmark, Norway, and Sweden etc. These countries, in 70s of the XX century, have been managed to settle objectives in practice, which were set, but not fulfilled by former socialist countries. The definition of the "success model" emerged in the scientific vocabulary in the second half of the XX century has been implemented in our country too. Whereas up to 90s that definition was used in relation to Germany, Japan, Sweden and other such kind of countries, China and Turkey were in the limelight of the world community in this respect in early 90s of the XX century. In-depth research was made to learn the essence of their economic development, which results in such a rapid and effective prosperity.

Keywords: *challenges of interaction, administrative-command, macro-level, limited economic, market balance, inter sectorial competitiveness, investment and consumption*

1. INTRODUCTION

According to its intrinsic logics, challenges of interaction between a production and market, is about the necessity of ongoing channeling of the production to social interests of a human being, as a demiurge of all forms of living process, since the productivity and efficiency of other activities directly depends on the level of its social security. During the period of administrative-command system of the former socialist camp, the development of market relations was hindered by mono-systemic economy, oriented towards the use of a single state property; overburdened regulation of production-economic processes at the macro-level; limited economic freedom of economy at the micro-level; centralized orientation of provision of material and financial resources. As a result of the collapse of the socialist camp at the end of the XX century, newly emerged international economic subjects inherited dilapidated economy with fairly weak social base, including production sphere. These new international subjects faced a challenge to choose a way of how to introduce civil market relations with socially oriented economy. By that time, there was a best international practice of European countries: Germany, Denmark, Norway, and Sweden etc. These countries, in 70s of the XX century, have been managed to settle objectives in practice, which were set, but not fulfilled by former socialist countries. Remaining market economies based on private property, European countries have successfully resolved a number of social problems. Due to high level of socialization of property through shares and partnership relations, as well as summarizing the management function through the Government, they achieved a high level of social security of all layers of the society, even then, 1/3 of their national revenues were channeled to the development of the

social sphere (social security, healthcare, culture, education etc.). It's understandable that the achievements on the solution of a number of social problems were based on already existing necessary social-economic bases. But, this in no way undermines the attractiveness of their experience, highlighting necessity of the creation of an economic basis later or soon (preferably as soon as possible). At the end of XX century, many foreign observers indicated a successful cohesion of a rapid economic growth and large-scale economic reforms in Sweden amid relatively social contradiction in the society. This successful and peaceful model of Sweden was significant contradiction to the rise of social and political conflicts in the environmental world. Swedish model of socialism covered private entrepreneurship and elements of public regulation of the socio-economic tool. (Mordal, 2009) The most interesting aspect of the model was that the government insured equal provisions for all its citizens in the fields of basic social gains (social security, healthcare and education), while interests of benefits were not decisive. (Fomichev, 2001) These facts are solid evidence of vast opportunities that realizes a market economy, which are implemented due to rational unity of state and market regulations in the fields of production and consumption, providing for high level of social orientation of the production (Rayzberg, 1995). When the leading economist and politicians of Azerbaijan had to choose a specific way of fundamental renewal of the production, they used a Swedish practice of the solution of social problems of population with the strengthening social support to production, of course, while taking into account local socio-economic characteristics. The success of this approach stemming from economic growth should have been hammered by a social progress: protection of social justice norms, gradual increase wellbeing of the people, stabilization and sustainable development in economic and social life. To this end, a package of activities should have been carried out aimed at the creation of an organic link between the newly emerged economy and social orientation. The main task was the transition of a society to new qualitative stage. The indicator of the development level of a human capacity became a leading factor in the social policy of democratic Azerbaijan.¹ Taking care of a people, his/her healthcare, education level, professional ability, general culture and supporting of active and creative capacity of working population, specialists is an integral part of a market economy, on which depends internal political stability and sustainable development of the society, where interests and demand of people are given outmost priority. Achieving social re-orientation of production at all structural levels, beginning from each working team to national level, are an important leverage for economic independence of Azerbaijan. Further measures on the improvement of economic forms depend on the growth rate of a market economy, one of the main goals of which is to ensure social protection and security of citizen, keeping their economic freedom. The measures are regularly carried out towards for increasing labor productivity and creating an enabling environment promoting and facilitating innovative ideas in modern period in Azerbaijan. Currently, measures aimed at social development of Azerbaijan are forged and implemented as a united system, taking into account development of different towns, settlements and regions. A large-scale program of social activities covering the whole nation is one of the backbones in this direction. But, to my mind it would better for further strengthen of social orientation of economy. It is possible through taking into account the demographic content of the population, national peculiarities, income (revenues), organization and labor, and consumption. While improving the welfare of people and resolving sensitive social problems, it's necessary to pursue effective structural reforms in the national economy of the country for the fulfillment of current and future tasks as well. Forecasts related to the processes of social orientation of the production should be based on real, concrete factors, not on abstract views. Solid base of social orientation of the production in the development of the country should find more realistic repercussion, should shift to a comprehensive development of economic and social relations.

¹ <http://www.economy.gov.az>

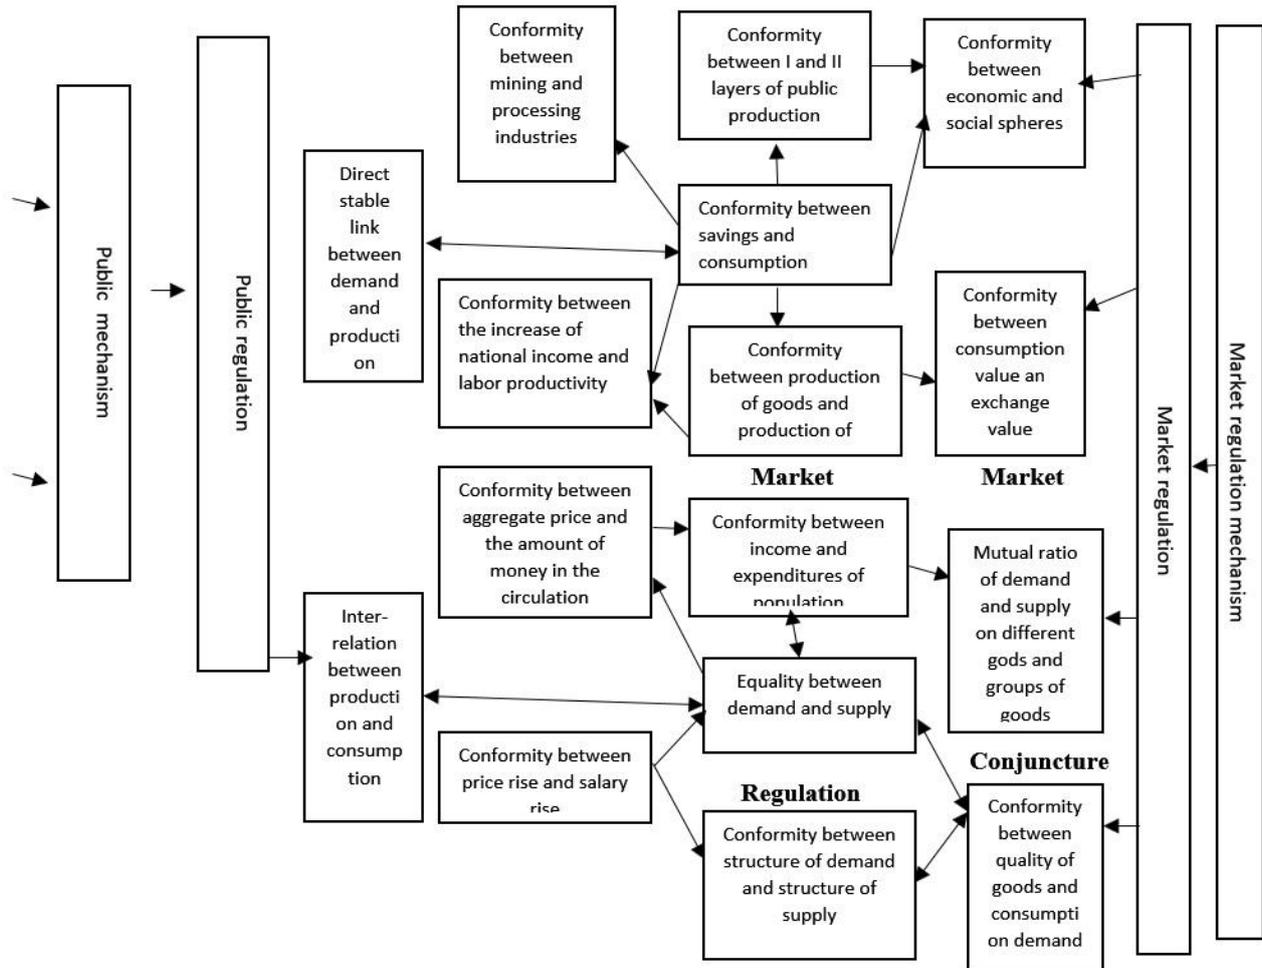

Currently, there is a flow towards the mobilization of resources for the provision of social re-orientation of the production at all structural levels, beginning from each labor team to the national level. In my opinion, this is an important advantage of economic independence of Azerbaijan. It's noteworthy to mention a well-known fact that Azerbaijan's model of socially oriented economy was stemmed from its advantageous factor – energy resources. In principle, this is consistent with the theory of an American economist M.Portrer, who says that country's economic model should use advantageous factors as dominant elements.² If we look at the system of world economy from the angle of "open doors" for defining an economic security based on the criterion of the international labor division, Azerbaijan is standing at the same level with the developed countries of the world (Great Britain, Germany, Italy etc.) according to the export quotas. It is evident that one of the main factors for economic development of any country, based on the definition of the International Economic Organization, is the level of provision of energy resources. Provision with those resources creates a favorable condition for the organization of a rational use from the export capacity and expansion of its assortments. The Organization of Petroleum Exporting Countries (OPEC) is a good example in this term, where the share of export quota in GDP is more than 50%, where in Azerbaijan more than 80% of the export is consisted oil and oil products. Taking into account this factor in the process of economic development which is the currently underway in Azerbaijan, strengthening of the processing industry through the development of the non-oil sector with the expanded export assortment plays an important role in the structure of the export. The Azerbaijan oil was a driving force taking the country to the leading positions in terms of socio-economic development. Over the last 5-6 years, the country's economy grew 2.6 and the industrial capacity rose 2.5 times. The poverty level declined 3-4 times and budgetary spending increased more than 10 times. A large-scale social programs are being implemented in the country and solid base was made for a stable development of the nation in the future. 2010-2015 was a new stage of the development for the economy of Azerbaijan. These years coincided with the period of crisis where many countries faced degraded main macroeconomic indicators, declined GDP, foreign trade turnover, massive unemployment and serious liquidity deficit. Azerbaijan has managed to escape from all of those tribulations. This is happened due to considerable strategic currency reserves, conservative foreign indebted policy, minimization of dependency on foreign financial markets, insuring of the stability of the national currency –AZN manat. As, Mr.Shahin Mustafayev, Minister of Economy of Azerbaijan said, both international and financial institutions and prominent ranking agencies and experts unanimously indicated the resilience of Azerbaijan's economy to the world financial and economic crisis. Economic Memorandum prepared by the World Bank highlighted that compared to other countries Azerbaijan faced the global crisis while being in a relatively strong position. Azerbaijan didn't undergo to major impacts and its financial sector managed to escape the crisis. According to the Fitch Ratings Agency, in 19 out of 21 European countries GDP has been declined, in one country remained unchanged and only in Azerbaijan, there has been an economic growth, which has been forecasted to be at 8% by the Asian Development Bank(ADB). It should be noted that this happened amid the reduction of the oil production by 2.2% in comparison with the relevant period due to technical problems, and fall of the price at the oil exchanges. But, as a result of measures carried out in Azerbaijan, the production in the agriculture sector rose by 4.4%, the overall volume of freights by 1.1%, the level of transportation of oil goods by 5%, retail turnover by 10% and the amount of paid services by 20.5%. All these factors contributed to the 13.7% growth of the non-oil sector compared to the same period, while proportionally contributing to the social wellbeing of the country, where income rose by 25% and average monthly salary by 26.5%. Citizens working in budgetary organizations benefited from that situation much, as the national currency was stable, wages and pensions were paid in time and

² Porter M. International competition. M. International relations. 1993. P.51

consumer price was declining. Naturally, as mentioned by Mr. Ilham Aliyev, President of the Republic of Azerbaijan “fall in prices of foodstuff, construction materials had a positive impact on the solution of social problems and increase of social welfare in Azerbaijan”. Mr. Aliyev also indicated the negative aspect of falling prices: “We can’t afford a large deflation, as it may have a negative impact on our overall economic potential”. New stage of economic development in Azerbaijan will be directed, as it was done in the past, at the strengthening of the non-oil sector, particularly expansion of the capacity in the agriculture, processing industry and development of regions. All these have been defined in the regional development programs covering 5-year horizon. Considerable economic achievements made by Azerbaijan over the relatively short period are undisputable facts. According to its economic development, Azerbaijan became the leading country of the region, doubled with its strong power. Of course, those achievements have not only been made through economic processes, as a result of operation and leverage of objective economic rules of market relations. This is the result of huge efforts, administration experience and all-sided scientific thinking united for the sake of restoration and development of the state. The structural model, which we propose, is based on the analysis of main characteristics features of the modern mixed market economy created in the industrialized countries as a result of a long evolution process. In this way, the structural model differs from economic models (Anglo-Saxons, China, Scandinavian etc.) of a free market period and current economic development models of the countries in the world. Fast economic development of Azerbaijan drew attention of a number of countries, international organizations, as well as different economists and experts. The definition of the “success model” emerged in the scientific vocabulary in the second half of the XX century has been implemented in our country too. Whereas up to 90s that definition was used in relation to Germany, Japan, Sweden and other such kind of countries, China and Turkey were in the limelight of the world community in this respect in early 90s of the XX century. In-depth research was made to learn the essence of their economic development, which results in such a rapid and effective prosperity. Now, in the beginning of the XXI century we can definitely say that Azerbaijan is standing among the abovementioned countries. This demonstrates the position of Azerbaijan, which is at the threshold of an economic miracle (Huseynova, 2009). It’s noteworthy to mention that the strategy, used with a great success in Azerbaijan, providing high socio-economic growth of the country, should be evaluated as an Azerbaijan’s model of the national development and logical outcome of the economic policy. This strategy, which was built on democratic principles, is based on dialectical coherence of national and human values. No doubts, only in that case it’s possible to preserve a national identity on the one hand, and to integrate systematically into the globalized world, while importantly positioning at the international labor division system and insuring optimal conditions for the operation at the regional and global stage. The proposed structure model envisages the unification of the pure market model the increasing role of the state. The rationale for the application of the structural model of the developed market economy in the countries with developing market economy has been analyzed. The market economy is being developed and market relations are being deepened in Azerbaijan. In this direction, the experience of the developed market economy has been taken as a basis for the development of the market mechanism, while also considering peculiarities of the national economy of Azerbaijan and background production habits.

Figure following on the next page

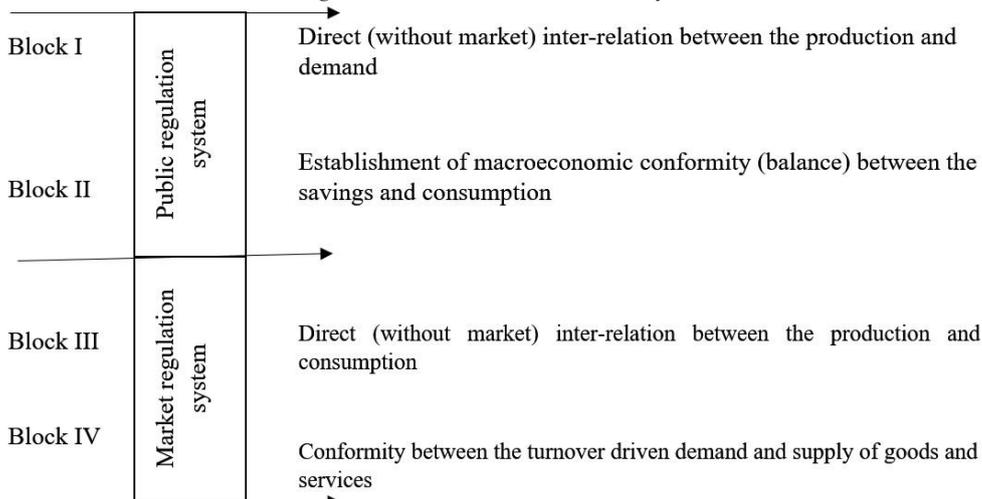

Figure 1: Schematic description of the structural model of market economy

The proposed structural model, which conforms to the market economy and its traditional relations, allows the more correct determination of the status of socio-economic relations covering the re-production and provides the scientific base for its justification. Modern market mechanism has a comprehensive nature. It includes elements, which coherently cover pure market elements, and non-market elements, e.g. elements that reflect economic functions of the Government. These 2 mechanisms that are principally deferent from each other, but, at the same time, are dialectically connected with each other, are tied through 4 block relations (systems). Such kind of basic relations is capable to define all elements of a market mechanism through details of inter-influence and inter-dependence and consequently determine direct links (avoiding market), which are adequate to them. They are briefly shown in the following block:

Figure following on the next page

Figure 2: 4 block relations systems

The block of four links, which are coherently related with each other in the market structure of the mutual influence between the production and market, should be analyzed as relevant stages of the market economy with different structure. The deeper and more substantiated relations determining the most basic features of socio-economic essence of the analyzed blocks are relations between the demand and production³. The apparent sides of such deep relations are relations between the production and consumption. In the everyday life, they are encountered as the amount of currency, volume of goods and services, and then demand and supply. System relations requires comprehensive accounting of the diversity of all elements and blocks affecting the formation of the market mechanism and distinguishing those which are leading and hold a central position in the system analyzed. Although not any single element can be perfect in itself (their inter-relation is a factor ensuring their perfectness), we think that inter-relations between the production and market can be considered perfect, if they are taken in the complex interaction. The inter-relation between the production and market among the main elements and blocks of the model analyzed is the apparent, more flexible and changing side. It can be considered as a relations that changes the shape of the apparent layer of the process.

2. RESEARCH

As it is seen from the diagrammatic sketch of the above mentioned structural models of economic development, the market equilibrium can be mathematically connected with the Leontyev macro model. The prerequisites for this equilibrium model consists of that a large number of products are produced, sold, purchased, consumed and invested in the country; each material production area produces only one kind of product. It is a form of solit relation between the production unit and the volume of production. In this case, the equilibrium balance between the consumption and production of the country will be expressed in the below mentioned equations system.

$$X_i = \sum_{j=1}^n a_{ij}z_j + Y_i \quad (i = \bar{1}, n) \quad (1)$$

Here: $X_i - \mathbf{i}$ is a cumulative product of material production;-

$Y_i - \mathbf{i}$ is the finished product of material production field ;

a_{ij} - is a relative fixed parameter, indicating the quantity of this or that product used to produce a particular unit of product.

³ Here it is required to determine the impact of relations between the demand and production on the inter-relations between the production and consumption, as well as generally, on the mechanism of re-production.

(1) Equity model is a national product of the finished product in the country

$$\sum_{i=1}^n y_i = \sum_{j=1}^n z_j \text{ - ensures balance.}$$

The model of market equilibrium (1) is only productive when this model can be settled at the price of $X_i \geq 0$ ($i=\overline{1, n}$). The Valras model is of particular importance, which enables the overall balance of competition to be explored in the market equilibrium. In this model, the country is being studied as a mechanism for the production and consumption of a large number of products based on the above mentioned system. Although there are many producers and consumers, none of them can affect prices. The Valras model proves that competitive prices may be exited for maximizing each producer, while each consumer can maximize its own benefits satisfying certain conditions. When these prices are set, it will be possible to eliminate inconsistencies between consumers and producers in the country. Let's assume that the N -type product is produced in the country where L is a consumer ($i=\overline{1, L}$) and m ($iL=\overline{1, m}$) is the producer. ($j=\overline{1, N}$) $P=(P_1, P_2, \dots, P_n)$ is vector line of values, but $X=(X_1, X_2, \dots, X_n)^1$ is the vector column of the products. The two functions characterise each consumer - $Y_i(p)$ demand function and $K_i(P)$ revenue function. It is assumed that for consumption:

$$K_i(p) = pb_i + l_i(p) \quad (2)$$

conditional balance payment is derived from $l_i(p)$ income, generated by the b_i revenue from the sale of the primary goods of the product and the cost of the consumer. $Y_k=(Y_{k1}, Y_{k2}, \dots, Y_{km})^1$ of each consumer's technological capabilities is characterized by the expense of-output vector column. Hence, PY_k skalyar sum will be the producer's profit. It is natural that all possible Y_k cost-product vectors will be the majority of Y_k production opportunities vectors. Then all costs for macroeconomics - the output vector Y_k will be calculated by the sum of individual vectors

$$Y = \sum_{i=1}^n y_k$$

For all consumers:

$$b = \sum_{i=1}^i b_i$$

The total aggregate indicator $[b] + y$ is the aggregate bid dimension. Distribution of consumption is carried out by the consumption of each consumer $X_i \in X_i$ ($i=\overline{1, L}$).

$$\text{Then } X = \sum_{i=1}^n x_i$$

The total aggregate is called demand vector. Note that some components of this vector may also be negative. (if these components represent supply (e.g. if the labor reflects)).

If $(x_1, x_2, \dots, x_i; y_1, y_2, \dots, y_m)$ are consumed and costly for the majority of sectors

$$X = \sum_{i=1}^n x_i = b + \sum_{i=1}^n y_k = b + y \quad (3)$$

If the aggregate demand is a contractual bargain, then it is assumed that there is a common division of production and consumption.

If: $X^* \in \varphi_i(P^*); Y_k^* \in \varphi_i(P^*)$ (4)

$$\sum_{k=1}^m y_k^* + b \geq \sum_{i=1}^l x_i^* \quad (5)$$

$$p \left(\sum_{k=1}^m y_k^* + b \right) = P^* \sum_{i=1}^l x_i^* \quad (6)$$

If conditions are met, then $(x_{1...}^*, x_{i...}^*, y_i^*, \dots, y_m^*, p^*$ cluster determines the balance of competition in Valras model. P^* has assumed as a vector of competitive prices (5), (6) has acquired the name of the Valras law in its dependence. If "=" dependency is the case in the (5) condition, then this model can be interpreted as a narrow Valras law in a narrow sense. Thus, if the aggregate demand exceeds the aggregate supply, (5) condition is made), then the competitive balance implies a co-production of production and consumption. In this case the price of aggregate demand in competitive prices is equal to the price of the aggregate supply (6 condition) at each of these prices, each consumer maximizes its profit in the P^* prices and each producer maximizes their profit in those prices. Hence, the existence of a competitive balance ensures that there is a high probability of P^* equilibrium prices that can be reconciled with the conflicting interests of consumers and producers in the macroeconomic system. It should be noted that the existence of a competitive balance does not automatically enable the economy to switch to this dimension and the conditions of the transition should be evaluated.

DOMINANCE IMPROVEMENT OF THE EXPANSION MECHANISM OF AZERBAIJAN FOREIGN ECONOMIC RELATIONS

Ramis Azizov

*Azerbaijan State Economic University (UNEC),
Azerbaijan, Baku
nahmedoglu@mail.ru*

ABSTRACT

Nowadays internal and external (foreign policy) course of Azerbaijan Republic could be an example for the other countries of the region. Azerbaijan demonstrates the practice of systematically conducting a balanced political course in such a complex region as the South Caucasus and the international position of the country is growing day by day. The article notes that Azerbaijan is a country with very favourable climate conditions and rich natural and soil resources, large reserves of high-quality oil and natural gas. This article discusses the development of external economic relations of Azerbaijan, a policy that guarantees the distribution of natural and industrial resources. At the present stage economic development of Azerbaijan is largely determined by globalization processes. Internationalization and the challenge of globalization reinforces the need to increase the openness of the national economy. The purpose of this article is to show the ways to strengthen the external economic orientation towards globalization, to open up new opportunities for development of the country. The idea of expanding world economic relations with both international organizations and individual countries is being justified, the possibilities of new technologies, the organization of management, knowledge and much more are being strengthened. The final part of the article is noted that the country's international trade gives Azerbaijan greater flexibility in the production and export of products with minimum costs. Also it states that in recent years Azerbaijan has increased its share in world trade by expansion of oil and natural gas extraction, reconstruction and construction of new power plants, restoration of the Great Silk Road and the tasks that today are set in the direction of expanding the base for tourism.

Keywords: *Azerbaijan, development, external policy, globalization, trade*

1. INTRODUCTION

According to the results of the World Economic Forum's Global Competitiveness Report (2017-2018) the economy of Azerbaijan is more competitive in comparison with other countries. Azerbaijan occupies the 35th line in it. Being an active participant in international integration associations and economic organizations, Azerbaijan using its geographical location and significant hydrocarbon reserves, subsequently leads foreign policy aimed to promote international trade and economic cooperation. Involvement in global economic relations becomes an indispensable condition for development of the country. Foreign economic activity in terms of economic independence carries with it a large reserve of its impact on both the domestic market and the involvement of the republic in the international labor division. Dynamic development of the economy and increasing its efficiency are main ways of development of foreign economic relations. Considering that we don not mean only development of the production potential, but also maintenance environment protection, and improvement of life and working conditions of population. As we know development of international trade gives the country the opportunity to sell and buy and to make reasonably decision regarding the development of the country's export potential and, finding the most appropriate way to expand it. At the same time, entering the world market always forces to reckon with the possibility and necessity of modifying and changing economic decisions in the future.

For the development of foreign economic relations, the policy of production must ensure the distribution of natural and production resources. To create such conditions the republic has a huge potential: excellent natural, climatic and soil conditions for growing agricultural crops; large reserves of high-quality oil and natural gas, which are of key importance in geopolitical terms; rich mineral resources (deposits of iron ore, non-ferrous metals, building materials); recreational resources; geographical location and transport networks for the passage of the ever-increasing flow of transit cargo and passengers from Europe to Asia and back, connecting Azerbaijan with many countries of the world. But as well as natural resources, Azerbaijan has an accumulated scientific and technical potential and an enterprising population with a favorable external environment - a political and legal system, and a sufficient increase in foreign investment.

2. CHAPTER 2

One of the most significant sources of income for the country is the high level of exports. Practically in the world companies producing competitive products receive large profits. For many countries, sales are the main motive for participation in foreign economic activity. In other cases, procurement allows you to purchase unique products that are not available in your own country. For Azerbaijan, trade is the most important direction of saturating the domestic market with goods and services. But foreign economic activity is not only operations, but also an intensive exchange of qualified specialists, new technologies, and access to investments, cheap labor and much more. Azerbaijan seeks to intensify foreign economic activity not only with the aim of improving and expanding economic activity, but also to determine on the basis of completely new approaches to expand facilities, the quantity and quality of goods produced, seeks to define the contours of its business activity in the world, to ensure, as a result, changes in economic and social life. As the country improves the economic legal environment of foreign economic activity, major changes in society will be accompanied by fundamental economic changes. International cooperation opens up great opportunities for the development of the national economy, because it can offer investment, technology, managerial experience, and access to world markets. The development of foreign economic activity indicates that the world economy is accompanied by a specialization of production. The fact is that a country trading with other countries specializes in the production of certain goods in volumes exceeding its domestic demand at the lowest cost. And here the manufacturer should try to acquire more customers. This will reduce its vulnerability to the loss of any one or more importers. Having access to goods produced in another country, which we cannot produce ourselves and at the same time exporting products for the production of which Azerbaijan has an advantage, it is possible to raise the standard of living of the population. Now Azerbaijan is more dependent on the import of many industrial and food products. This type of dependency distracts significant credit resources that could be used in various sectors of the economy in order to produce goods for domestic consumption and, consequently, reduce unemployment. But we should not talk about the abolition of dependence, but about changing and improving its trading advantages. Attracting foreign companies, the state has now made large investments in the gas sector. However, the state should take an active position in identifying other key sectors of the economy and assist them in acquiring the necessary investments by providing incentives. By directing efforts into the industries such as petrochemical, mechanical engineering, metallurgy, silk, winemaking, carpet weaving, fruit and vegetable, fish, tourism economy can become less dependent on the import of finished products. Production of local products that can compete with imported products should be encouraged. The recent devaluation of the national currency makes local products less expensive and clearly imported products more expensive and that leads to decrease in demand, therefore, to a reduction in imports. Exchange rates also affect the demand for products of a particular country.

These arguments may explain the reasons for government intervention in foreign trade. International trade gives countries greater flexibility in the specialization of production and export of products that use minimum costs. The country will benefit if it imports goods that are less efficient in this country. Only advanced economies with technological advantages are most capable of producing diverse and complex products. At the same time, these countries have an excess of highly qualified specialists. Investments in the development of tourism can be more efficient than, say, oil production. Therefore, it is necessary to find more efficient ways to expand exports. Using our natural wealth for tourism can give the country a significant economic benefit. Many countries have long realized this. It is necessary to exercise caution when using natural resources, carefully assess the forms and methods of their involvement from the point of potential environmental impact and preservation of the ecological balance. The problem of finding rational world economic relations can largely be solved by increasing the financing of agriculture. In many countries, the development of agriculture is carried out on the basis of two forms of financing: at the expense of credit sources and at the expense of own funds of economic units. There are countries where agriculture is subsidized (developed countries allow themselves to do this). A significant place in the development of agriculture is taken by the creation of a developed infrastructure - water, energy and gas supply. The problem of investing the infrastructure of villages should be solved at the macroeconomic level. There is an urgent need to build small manufacturing industries in areas where crops are grown, to channel funds to modernize existing enterprises and equip them with the most up-to-date machinery and technology. On this basis, it would be possible to somewhat reduce rural unemployment. Further improvement of the existing mechanism for the distribution of investment funds is required to expand peace ties. There are more and more opportunities for the development of foreign relations in Azerbaijan. Now he is in the process of joining various international organizations. This will accelerate the process of integrating the republic's economy into the world economy. World trade poses a number of challenges for the improvement of market relations. The effective participation of some forms of management in trade operations reflecting national interests implies their further growth and a relative reduction of other forms. However, if imports are based on an appropriate organizational and legal system, then with regard to exports, it should be considered as features of the advantages in the production of certain goods and services. An important requirement for entering the world market is to have advantages either in manufacturing products, or in the supply of fuels with energy resources, or the availability of technology, preferably in infrastructure. Having advantages in quality or price of the goods produced, the country can strengthen its position in the global market. Azerbaijan can increase its share in world trade. The main role in these changes may have: expansion of oil and natural gas production, attracting foreign oil companies; assistance of foreign companies in the reconstruction and construction of power plants (will allow to export electricity); reconstruction of oil refining and petrochemical industries, whose products have a large export potential; the development of engineering industries (in particular, oilfield equipment) using advanced technologies will allow them to be exported to other countries; the availability of building materials favors the development of construction; availability of conditions for the production of all types of food, which will provide an opportunity for the country's self-sufficiency in food and its supply to the external market; recreation of the Great Silk Road and those ambitious tasks that today are set in the direction of expanding the base for tourism - hotels, transport, roads. The expected flow of tourists will generate the tourism industry, will be a solid source of income for the country; rational use of geopolitical location will provide a significant contribution to the income of the country. Of course, it must be borne in mind that foreign trade is changing under the influence of the scientific and technological revolution of geopolitical and economic factors occurring in the world.

For the development of an economy that satisfies the requirements of the world market, it is necessary to ensure growth conditions from both the internal and external environment. Only their joint consideration will make it possible to outline the changes that are required for the implementation of bills for the development of the economy in market relations. Among these conditions it can be noted: the need to assess with a sufficient degree of reliability of natural, material and labor resources, as well as the natural and climatic conditions that characterize the main motive of economic activity; the need to assess the current state of the economy and identify the main directions of change (taking into account the internal and external environment) for economic growth; evaluation of economic, legal, political systems and the possibility of practical implementation of economic changes in the country; assessment of the country's participation in international trade, conditions conducive to increasing demand. At the present stage, for the development of international trade, Azerbaijan has good starting points: the presence of natural resources and climatic conditions, a relatively developed industry, a certain scientific and technical potential, a sufficiently skilled labor force. The political and legal foundations for the stability of the country have been created. Therefore, the state is capable of changing the country's economy to the extent that the world economy demands, into the integration with which the republic seeks. Already now, it is possible to overcome to a certain extent those obstacles that exist in the field of foreign trade. These conditions are created by the development of small and medium-sized businesses and the increase in oil exports. To promote equilibrium between exports and imports, it is necessary to attract large capitals in the manufacturing industries. For the practical implementation of this event, the state should privatize individual monopolies, the financing of which it cannot assume in full or in part. Better use of the geographic environment by expanding the development of tourism can be a source of attracting additional funds from abroad, which can be used to import the necessary machinery, equipment and technology. The growth of export capacity is determined by the development of industries involving the involvement of natural resources - this is the oil and gas industry. At the same time, if the development of this industry is consistently transferred to international principles in the field of organization and management, then we can ensure its effective functioning. Azerbaijan is one of the first in terms of economic growth in the world. A successful oil-based oil strategy was modernized, a non-oil economy developed, social welfare improved, assets backed by assets, and strategic foreign exchange reserves that exceeded GDP. It should be noted that in 2017 the foreign trade turnover of Azerbaijan amounted to 22 billion 593 million 631.99 thousand dollars. At the same time, exports for the reporting year amounted to 13 billion 811 million 624.44 thousand dollars, import - 8 billion 782 million 7.55 thousand dollars. According to the Customs Committee, in January-September 2018, Azerbaijan exported 21,945,925 tons of crude oil and crude oil products derived from bituminous minerals. For the first 9 months of this year, the volume of exported products in annual comparison increased by 43%, the cost - approximately doubled. Exports of crude oil and crude petroleum products derived from bituminous minerals amounted to 81.18% of total exports of Azerbaijan. In recent decades, Azerbaijan has been a supporter of organizations conducting various events. Azerbaijan is also the initiator and participant of important projects. For its strategic role as a natural bridge between Europe and Asia, Azerbaijan has always been an active participant and an important initiator of projects of regional and interregional cooperation. Today, Azerbaijan participates in the implementation of a number of key projects on the development of transport corridors East-West and North-South. The introduction of the Baku-Tbilisi-Kars strategic railway connecting Azerbaijan, Georgia and Turkey within the East-West international transport corridor will facilitate regional trade by providing cross-border rail links between East and West. The first container train to Europe from Central Asia, the Caspian Sea, Azerbaijan, Georgia was launched in 2016. This proven railway train, which proves that the transit route can be reduced from 30 to 35 days to 15 days, is another major

project with a capacity of 25 million tons per year, the largest and multi-purpose port on the Caspian Sea - the New Baku International Sea Trade Port (Alat). Located near the railway crossings of the Alat port with Russia and Iran, as well as near Baku airport, it allows it to cross other ports of the Caspian Sea with an efficient railway and regional coastal zone and unlimited access to remote regions. Azerbaijan is also one of the active initiators of the international North-South corridor, which will provide transportation of goods from Northern Europe and Russia to the Persian Gulf, India and other countries. Construction work on the Qazvin-Rasht section of the Qazvin-Rasht-Astara railway (Iran) has been completed. The Astara-Astara section (as well as the Iranian border) and the railway bridge across the Astara River were completed on the Astara (Azerbaijan) railway. The construction of the Rasht-Astar part of the missing part is still completed, and Azerbaijan has allocated funds. Once the project is successfully commissioned, it will make a significant contribution to regional cooperation by joining the railways of Azerbaijan, Russia and Iran. Thanks to the initiation and implementation of projects in the field of sustainable energy, Azerbaijan recognized itself as an energy supplier and has become an important bridge between Asia and Europe. Today, Azerbaijan is one of the largest infrastructure and energy projects in Europe, the Southern Gas Corridor and its two main parts, the Trans-Anatolian Pipeline and the Adriatic Pipeline, which provide transportation of hydrocarbons from the Caspian basin. Decree of the President of the country 2020: "Looking into the future" The development concept is an indicator of the beginning of a new stage of development in the country. The main strategic goal of the concept was to achieve sustainable economic growth and high social welfare, effective government and the rule of law, the full implementation of all human rights and freedoms and the active status of civil society in the social life of the country, taking into account the available resources and resources. It can be noted that for the first 9 months of 2018, the following indicators were observed:

- In general, the growth of the non-oil sector amounted to 2.5%
- Non-oil industry growth 3.1%
- Agricultural production increased by 2.8%
- Azerbaijan's foreign trade turnover increased by 7%
- Trade surplus amounted to 4.4 billion dollars

In January-November of this year, foreign enterprises and companies allocated Azerbaijan a total of 4 billion 754 million manat. According to the State Statistics Committee, 3 billion 838 million manat (80.7%) of the funds allocated by foreign countries and international organizations, which accounted for investors from the United Kingdom of Great Britain, Switzerland, Turkey, Malaysia, USA, Japan, Russia, Iran and the Czech Republic. Note that the amount of funds invested in the country from domestic sources is much larger. A total of 12 billion 899 million manat was invested in the main capital from all financial sources in January-November 2018 for the development of the economic and social spheres of the country. This is 8.8% less than the same period last year. The volume of funds channeled into the fixed capital of their domestic resources amounts to 63.1% of the total investments. Besides to oil, oil products and natural gas, Azerbaijan can provide products of the chemical industry — iodine and bromine, non-ferrous metals, aluminum, copper, mercury, to the external market. From time immemorial, Azerbaijani handmade carpets, garments, and crafts have been valued throughout the world. There are interest in the world market: cotton, tobacco, tea, fruit and others. One of the factors contributing to the recognition of priority in trade operations with more developed countries is modern technology and technology, allowing for faster improvement of production technology. For the development of foreign economic relations, the production policy must ensure that the distribution of natural and industrial resources so that they are agreed and basic needs. To create such conditions, the republic has great potential: excellent climatic and soil conditions for growing crops, large reserves of high-quality oil and

natural gas, and rich mineral resources. Investments in the development of tourism can be more efficient than, say, oil. Therefore, it is necessary to find more efficient ways to expand exports. One of the most positive factors is that domestic investment accounts for about 70 percent of the total portfolio. The experience of developed countries shows that the private sector plays an important role in gross domestic product. The development of the private sector demonstrates the positive legitimacy of economic processes. Formation of 83% of the Azerbaijani economy in the private sector is an indicator of the development trend. At the present stage, the economic development of Azerbaijan is largely determined by the globalization processes in the world economy. Its internationalization and the challenge of globalization reinforces the need to increase the openness of the national economy of Azerbaijan, the formation of extensive economic ties. Transformation and globalization processes are a difficult and painful period for any national economy, including Azerbaijan, but at the present stage this process corresponds to the leading trends of world development and simultaneously meets to some extent the national interests of each individual country in the world. The openness of the economy, its integration into the world make an increased demand for the use of the principles of the functioning of the world economy. First of all, it is the creation of all the necessary organizational and legal conditions. At the same time, the creation of business information services and their interaction with similar organizations in other countries may have a major role in the development of the world market. In the search for reliable partners, identifying their needs, such services, as the practice of foreign countries shows, to a significant extent predetermine the success of trade relations. The strategy for the development of foreign economic relations of Azerbaijan involves both taking into account the natural and economic conditions, as well as strengthening rational, equal and beneficial relations with the states of the world.

3. CONCLUSION

In modern conditions, involvement in world economic relations is becoming an indispensable condition for the full development of the country. Foreign economic activity in conditions of economic independence harbors a large reserve of its impact both on the domestic market and on the involvement of the republic in the international division of labor. The main ways of developing foreign economic relations are the dynamic development of the economy and increasing its efficiency. This refers not only to the development of the production potential, but also to preserve the environment, improve working conditions and the life of the population. The greatest advantage of the development of international trade is that, giving the country the opportunity to sell and buy, it allows to evaluate the processes and activities associated with them, to make a fairly reasonable and correct decision regarding the development of the country's export potential.

STATISTICAL ANALYSIS OF EMPLOYMENT AND UNEMPLOYMENT IN AZERBAIJAN

Ramiz Javadov

*PhD in economics, associate professor Azerbaijan State Economic University,
Azerbaijan State Economic University
Baku, street Istiqlaliyat-6, post office AZ1073
ramizjavad@gmail.com*

ABSTRACT

Like any other market, labor market is also determined by supply and demand. Using statistical methods, the author evaluates the labor resources in Azerbaijan and reveals the dynamics of the employed and unemployed population.

Keywords: *labor market, labor resources, unemployment rate, employment, economic activity, working age, International Labor Organization*

1. INTRODUCTION

One of the main categories of labor statistics is labor resources. This is the potential indicator of the proportion of population that is capable of working. The country's labor resources include primarily employed and unemployed, as well as the able-bodied population, which in the study period does not work and look for work for one reason or another. In addition to above listed categories of population, the labor resources include people who are able-bodied to study without a job.

2. POPULATION AND LABOR RESOURCES OF AZERBAIJAN

According to the methodology of the International Labor Organization (ILO), the sources of formation of labor resources are [Bashkatov B. (2001) International Labor Statistics, p-47]:

- able-bodied population of working age;
- working people of retirement age
- working adolescents.

In statistical practice, a variety of absolute and relative indicators are used to assess the labor resources and economic population. These include the following [Gusarov V. (2006). Statistics, pp-228-230]:

- total number of labor resources;
- intensity of reproduction of labor resources;
- coefficients of the total and pension load of the working-age population;
- coefficients of working capacity of the total population and the working-age population;
- employment rates of the total population and working age population and etc.

And for the forecast calculation in the perspective of the number of labor resources (**LR**), you can use the following statistical model [Bashkatov B. (2001) International Labor Statistics, p-55]:

$$LR_t = P_0 \cdot (1 + C_n)^t \cdot d_{wp} \cdot C_{wpw}$$

where

P_0 -population size at the beginning of the source year;

C_n -coefficient of natural population change;

- t**-the number of years in the forecast year;
 d_{wp} - proportion of the working population in the total population;
 C_{wpp} -coefficient of working capacity of population at working age.

In the composition of the entire population, the economically active population attracts special attention. It is this category of population that participates in the creation of a social product. In order to assess the economic activity of the population, first of all we analyze the composition and structure of the population in terms of working capacity. For this purpose, using statistical data, we will build a table 1.

Table 1: Population size and labor resources of Azerbaijan(in thousands)[5]

Year Indicators	2003	2017
Population size	8269,2	9810,0
The population in working age	5206,4	6705,5
Able-bodied population of working age	4767,1	6262,2
The number of labor resources	4923,0	6408,1
Natural population growth	64,5	86,9

From the analysis of the data in the table 1, it follows that in comparison with 2003, in 2017 the number of able-bodied population of working age increased by 28.8%. During the studied period, the share of working age population in the total population increased by 5.4 percentage points. At the same time, the share of able-bodied persons of working age in the total population of working age people increased by 1.8 percentage points. For the studied period dynamics of labor resources of the country accounted for 30.2%. Good results show natural growth rate of population: per thousand people natural growth rate increased from 7.9% to 8.9%.

3. LABOR MARKET AFTER 5 YEARS

The main source of labor resources in Azerbaijan, as in any other country, is able-bodied population of working age. Therefore, the prospective population of this category is of great importance. To calculate the prospective “able-bodied population of working age” for the next five years, we use the statistical model[1] and data from table 1 and obtain the following result:

$$LR_5 = 9810,0 \cdot (1 + 0,0089)^5 \cdot 0,684 \cdot 0,934 = 6551,1 \text{ thousand people}$$

The calculation results show that by 2022 the number of able-bodied working-age population in Azerbaijan is expected to increase by 288,9 thousand people compared to 2017. This means that in 5 years changes are expected in the population structure, that is, the proportion of the population at retirement age will decrease. Under market conditions, a part of labor resources realizes its labor potential through the labor market. Labor market participants are employed and unemployed. The first of them represent the volume of labor resources, which in the study period are engaged in the realization of their labor opportunities, and the latter represent the volume of labor resources that are looking for ways to realize their labor opportunities.

4. UNEMPLOYMENT AND EMPLOYMENT RATES

Along with absolute indicators, the unemployment and employment rates are used to assess the situation on the labor market. These relative indicators are defined as the proportion of the relevant category of labor resources in the economically active population at the beginning

(end) of the period .For the analysis of the level and dynamics of economic activity, employment and unemployment, let's consider the data in table 2.

Table 2: Economically active population, employed and unemployed in Azerbaijan(in thousands)[5]

Indicators	2003	2010	2015	2017
Average annual population size	8309.2	9054.4	9649.3	9854.1
Economically active population	4373.5	4587.4	4915.3	5073.8
Employed in the economy	3972.6	4329.1	4671.6	4822.1
Unemployed	400.9	258.3	243.7	251.7
Employment rate of the entire population,%	47.8	47.8	48.4	48.9
Employment rate,%	90.8	94.4	95.0	95.0
The level of economic activity of the population,%	52.6	50.7	50.9	51.5
Unemployment rate,% ¹	9.2	5.6	5.0	5.0

The study of absolute and relative data in table 2 shows that the share of employed population in the total population compared with 2003 in 2017 increased by 1.1 percentage points. The level of economic activity of the entire population for the study period decreased by 1.1%.The calculation shows that the unemployment rate in Azerbaijan from 2003 to 2008 exceeded the natural rate (6%)².Since 2009, this indicator is within the natural rate of unemployment. During the studied period, the employment rate in relation to the active population grew by 4.2%, while the dynamics of employment in absolute terms accounted for 849.5 thousand people. As a result, the dynamics of the economic activity of labor resources lags behind the numerical dynamics of the labor resources themselves.

Table 3: Growth rate of labor market indicators from 2003 to 2017 in Azerbaijan(%)

Indicators	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
Labor resources	100,5	102,0	108,0	102,7	102,4	102,0	101,7	101,7	101,4	101,1	102,5	99,4	100,8	100,2	100,9
Economically active population	100,1	99,8	100,3	100,5	100,9	100,8	101,2	101,2	100,8	101,3	101,5	101,7	101,5	102,0	101,2
Employed	101,0	101,1	101,1	101,2	101,3	101,3	101,3	101,3	101,1	101,6	101,7	101,8	101,5	101,9	101,3
Unemployed	91,4	87,0	91,1	91,6	96,5	93,3	99,2	99,3	97,1	96,9	97,3	100,5	102,5	103,7	99,6

(The table is based on official statistical data by author)

Table 3 shows the growth rates of main indicators of the labor market in Azerbaijan from 2003 to 2017, based on official statistical data. During the studied period, the highest growth rate of labor resources was observed in 2005 compared to 2004, and the total number of labor resources increased by 8%.The negative growth rate of labor resources was observed in 2014 compared to 2013.This year, the number of labor resources decreased by 0.6%. The number of labor resources of Azerbaijan on average increased by 1.8% annually. Average annual growth rate of economically active population accounted for approximately 1%. As for the number of employed, annual growth rate comprised 1.3%, and it was about 59.3 thousand people annually. However, the number of unemployed showed average annual decline of 3.6%. The data in Table 3 can be represented on Figure 1.

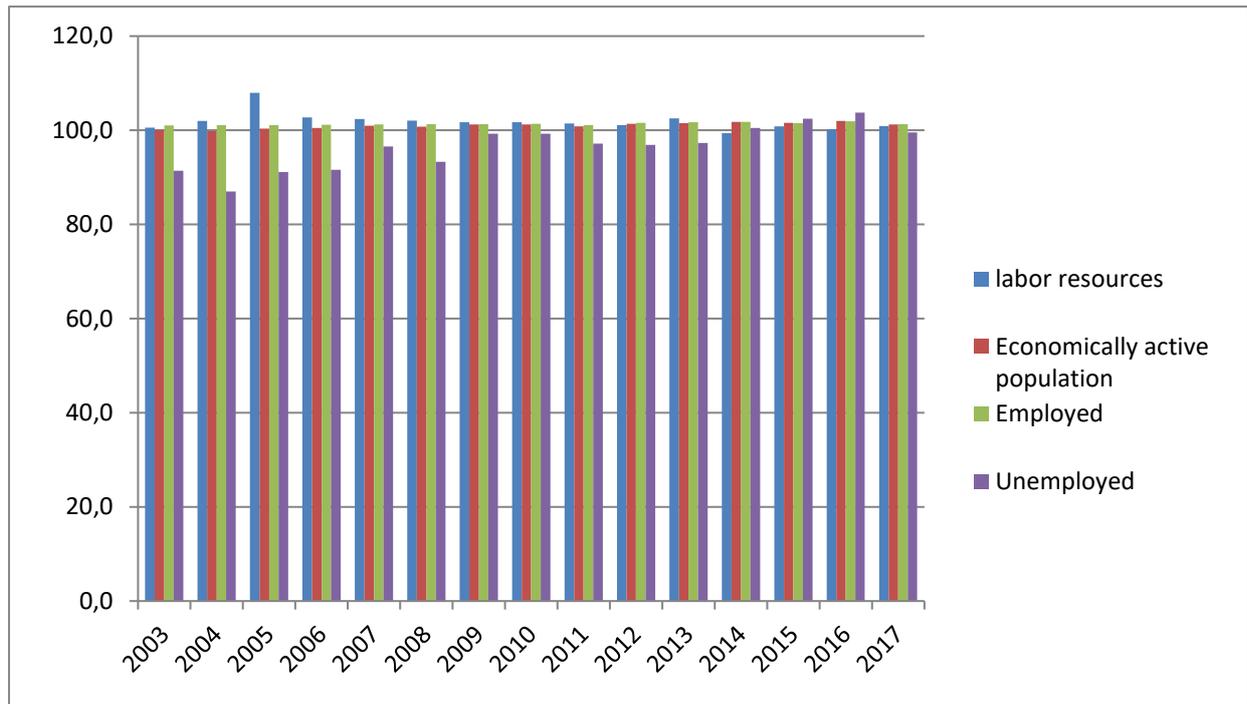

Figure 1: Growth rate of labor market indicators from 2003 to 2017 in Azerbaijan

5. CONCLUSION

Since 2003, in Azerbaijan, the unemployment rate is estimated not only by the number of officially registered unemployed population, but also by ILO methodology. For this, by ILO methodology population surveys on employment issues are conducted annually. The number of unemployed from 2003 to 2017 decreased by 149.2 thousand people and accounted for 251.7 thousand people. An important role in reducing the number of unemployed is played by the successfully pursued state employment politics. Thus, a statistical analysis of the composition of population and labor resources shows that despite the fact that in 2017 labor resources made up almost 65.3% (6408.1/9810.0) of the total population, the employment rate for labor resources was 75.3% (4822.1/6408.1). From this, it follows that in the study period, almost a quarter of the labor resources in the labor process did not participate. We assume that in order to increase the level of economic activity and employment of the population in the country, it is necessary to increase the level of joint action of employment services, personnel departments of economic entities and educational institutions.

ROLE OF TOURISM IN SOCIAL DEVELOPMENT OF THE REPUBLIC OF AZERBAIJAN

Saadat Gandilova Tagi

Azerbaijan State University of Economics (UNEC), Azerbaijan

Vice-rector Students Affairs, Associate Professor

s.gandilova@unec.edu.az

ABSTRACT

Recently, tourism industry plays a particular place in Azerbaijan. Tourism in the framework of strategic roadmap of national economy is considered a priority area of national economy. The following words of Ilham Aliyev, the president of the Republic of Azerbaijan proves this: "In the beginning Azerbaijan was famous for its gas and oil. I intend Azerbaijan to be famous for its picturesqueness and comfortableness for gaining fame as a tourism centre". The role of tourism in social development covers the urgency of a study subject. The studies directed to learn the role of tourism in economic development of the country were aimed to ascertain the essential tendency of tourism industry and to offer favourable methods for the purpose of increasing the significance of tourism in national economy.

Keywords: *Azerbaijan, role of tourism, social economy, tourism*

1. INTRODUCTION

Tourism in Azerbaijan is one of the rapidly developing fields of economy. "Land of Fire" being relatively small is situated at the intersection between Europe and Asia, thus this makes its territory involve for development of touristic business. At the present time, incomes yielded by tourism are a little more than 10% of national economy. The quantity of tourists annually increases in amount of 15-20%. Tendency is sufficiently understandable: Optimal circumstance for any feast is allowed in Azerbaijan: nature twinkling with all colours of sunny Azerbaijan, golden beaches covered by warm waters of the Caspian Sea, shadowy forests of cold springs, rich wild nature, slender gazelles, fallow deer (hinds), exquisite pheasants, marvellous rocky mountains, mirror surface of lakes, delicate beams of southern sun, eastern hospitality of our people and ordinary Azerbaijani cuisine - all these aforesaid don't only attract those who desire to improve their health but also those who desire to recognize Azerbaijan, to take delight viewing unrepeatably colours and noteworthy sightseeing places, to live the charm of journeys and to regard today's amenity from the point of view of past. And therefore, sanatoria-recreation and excursion - tourism service in republic successfully develops and improves year after year.

2. SOCIAL-ECONOMIC SIGNIFICANCE OF TOURISM

Experience of the developed countries proves that one of forceful powers recently affecting the velocity of world economy is a field of tourism. Its development firmly influences on formation of budgets of a receiving country and on stabilization of trade balance. One of the main problems facing Azerbaijani economy - a solution of the development issues of this field with a rational use of the oil revenues to ensure a country's development. It should be also noticed that the high level of development at any country is achieved by only providing development of regions. Consequently, one of the priority fields of state policy is a development of non-oil sectors in republic. In modern age social-economic development of Azerbaijan is characterized with active formation of market infrastructure and a transition to new model of management. This goal has been dedicated to one of the essential components of social-economic policy of regions. However, permanent attention is focused on activity of infrastructure in regions because of social-economic development policy being complicated. Under the requirements of the present time, the most purposeful method is to compile and draft various programs and

projects to attain a long-termed development of the republic. The existence of geographic, economic and natural resources in Azerbaijan has an initial significance for further development of region. But the attained achievements don't completely reflect a rational exploitation the current potential of regions. Proportional development of the non-oil sector allows for constant economic development by protecting only macroeconomic stability. Development of social field is one of the most eminent factors of betterment of economic situation, empowerment for people to gain incomes and the subsequent reduction of poverty. Currently, it is possible to achieve an expedited development in different fields of industry and agriculture by using potential existed in republic more affordably. All-embraced economic development of the country, entrepreneurship support, an increase of people's living level and solution of poverty issues cover the most significant governmental issues on the agenda. And the issues on re-structuration and improvement are maintained for duly and successful solutions of issues or matters related to this context stipulated in state programs all regions. At present times, formation of infrastructure in the country, promotion of the existing potential in global economic space, and especially development of non-oil area are hugely paid attention. The explorations held in the country and reports from foreign countries show that tourism is one of the most perspective sectors having the highest potential. Legislation on development of this field is further improved, and various precautions are taken to involve investment. Making certain investments on development of tourism industry in republic, the constant revenues are yielded at local and central budges. Development of tourism industry in Azerbaijan as in other several countries affects in forming budget. As it appeared in world experience, one of the most significant factors of development of tourism industry is an adoption of normative-legal instruments that regulates this field, a development of little and medium business and a creation of convenient environments. These are the most essential factors for entrepreneurs to attract for development of non-oil sector and creation of conditions of the country in the regions. Works held within framework of the second State Program (2009-2013) on development of social-economic regions of the Republic of Azerbaijan and the second State Program (2010-2014) on development of tourism of the Republic of Azerbaijan are highly carried out in Shaki-Zagatala economic region as in all regions. Balakan, Zagatala, Gakh, Shaki, Oghuz and Gabala are included to Shaki - Zagatala economic regions. These economic regions have mineral raw materials and are specified with rich flora and fauna, a plenty of underground and surface therapeutic water resources and favourable climatic condition. There are broad opportunities to create recreational zones and tourism vacation at the abovementioned economic regions, including development of tourism. Betterment of unsuccessful families and provision of old persons by means of development of affordable social defensive system is one of main criteria. As social infrastructural development is gradually increased, the quality of base services rises in other fields of education, science, health and environment. Poverty level in Azerbaijan in 2017 in comparison of 2014 has increased twice, and poverty level has been diminished from 28% to 6%. This indicates that the state makes opportunities for levelling up life conditions of people. While improving life conditions, poverty level is gradually reduced.

3. TOURISM IN AZERBAIJAN AS A SOCIAL FACILITY

Modern Azerbaijan - is a country where the urgent measures are taken to expedite rate of economic development through tourism. Law on tourism adopted in 1990, state programs on development of tourism, and other law and regulations applied in the country are possible to include to normative-legal acts aiding to reach the goal. The country takes an active part at international tourism events and relations are established with many countries in the field of tourism. Touristic potential of Azerbaijan are regularly disseminated on different foreign channels. Moreover, the amount of accommodation facilities for tourism increases. The number of foreign tourists visiting to Azerbaijan within period 2010-2013 has increased.

Increase rate became 27%. Their number reducing slightly within period of 2014-2015 reached to 2 006 200 people. It was recorded that an increase had become 20 percent in 2016, the number of tourists who visited to Azerbaijan reaching to 2.691,998 people had become 20 percent in 2017, and an increase in 20 percent was recorded in the tourist flow to our country. An increase in number of tourists visiting from separate states was recorded as follows: The Russian Federation - 853 082, Georgia - 537 710, Iran - 362 597, Turkey - 301 553, United Arab Emirates (UAE) - 102 360, Iraq - 62 454, Ukraine - 57 756, Saudi Arabia - 33 273, other countries - 381 213. The proportion of citizens of Russia, Georgia, Iran, Turkey and UAE was more in general number of foreign citizens visited to our country in 2017 and accordingly it became 31.6%, 19.9%, 13.4%, 11.2% and 3.8% (12). It is denoted in statistics that the number of Azerbaijanis travelling to other countries has genuinely increased twice more than the number of foreign guests in Azerbaijan. Concurrently, we have observed a decrease in their number within last two years. We may note changes occurred in the economic and political life all over the world by learning the reasons for the decrease of indicators. Different types of tourism are chosen in the economic literature: recreational, scientific, business, entertainment tourism, etc. It is possible to claim that most travellers of Azerbaijan in 2015 have visited to entertain. Their number was recorded to 668,800 people. The country actively contributes to develop business tourism. The least number of tourists has visited to our country with medical and religious goals. It is known that development of tourism industry allows for increasing employment and population in the country. Increase in the number of businessmen in Azerbaijan is detected. Their number has become 61,500 people in 2015, 68,500 in 2016 and 73,500 in 2017. At recent time the revenue gained through tourism sector is 2,437,300,000 manat.

4. SOCIAL PRIORITIES

Azerbaijan has become relatively new member of global tourism industry, but notwithstanding, this has not impeded it to gain good achievements in modern field. Since 1993, Azerbaijan is sure for actions of country's government and the large financial-industrial corporations in developed countries have aimed their interests to Azerbaijan having rare tourism potential. The country by regulating legal relations in the field of international tourism in 2001 and relating the functions of governments of world countries at a certain extent has jointed to the World Tourism Organization attached to United Nations Organizations (UNO). This organization also analyses development tendencies international tourism market and supervises them. In 2004, the Ministry of Culture and Tourism of the Republic has compiled the logotype and slogan to draw attraction of foreign tourists. Slogan is sounded as: "Azerbaijan – European Charm of the East", "Formation of estimation relations to historical roots, mentality and culture". This slogan reflects combination of location of the country in two continents and its rich eastern culture with living level of Europa. The main tourism slogan of Azerbaijan is broadcasted in advertisements (video clips) on televisions "EuroNews" and "CNN" into English and dubbed as "Azerbaijan – European Charm of the East". It is obvious that an expression "advertisement" mentioned above is able to attract both European and Asian tourists. However, flow of western tourists for Azerbaijan has a priority because this is the most profitable and promising. In addition, Azerbaijan is recognized as "Land of Fire" abroad and because a name of the country is translated from Persian language like this. As in previous years, majority of the foreign citizens who visited Azerbaijan were citizens of Russia, Georgia and Turkey. An increase in the number of tourists from France, Spain, Norway, Greece, Croatia, Great Britain, Germany and Belgium and Europe and some other countries all over the world was observed. But the flow of citizens from Russian Federation, Ukraine and Iran to Azerbaijan reduced for several reasons (devaluation of Russian ruble, unstable political situation of Ukraine and socio-economic tensions in Iran).

Azerbaijan has great potential to develop tourism in all types. Except that one of the most developed fields in recent time is a cultural tourism because in Azerbaijan there are sufficiently notable cultural places and numerous cultural monuments. Probably, Azerbaijan should use the experience of countries been able to make a success of the negative results of financial crisis and to retain European clients in their own recreational and tourism centres by virtue of their rapid economic policies. For the first, among these are Turkey and Egypt which continue to fill or draw up the state budgets with foreign tourists. All initial conditions are available for the development of ecological, ethnographic and sport tourism in the country. At current time, it can be surely expressed that Azerbaijan has already become a specific part of global international tourism, and large investments made to Azerbaijani tourism, the increase in the number of foreign tourists who visited the country and at last, the expensive projects to build new tourist complexes financed by foreign investors prove this situation. However, popularization of Azerbaijan in tourism world depends on development rates of tourism-recreational system of this country. One of the factors to attract foreign tourists is an aimed element to international tourism incidents (activities). International tourism has been worthily represented in Azerbaijan. Because various sport, political, economic and cultural events including the Judo European Championships, world championships in chess and wrestling, Baku musical jazz festivals, are frequently held in the country. The essence of tourism field for Azerbaijan is noted under legislation: Principles of state police aimed to constitute legal basis of tourism market and bases of tourism activity are determined in law "On Tourism" in Azerbaijan, relations or attitudes raised in tourism field are regulated, rule of profitable use of nature reserve tourism is defined as one of means of social-economic development provision. "Increasing level of education, culture and developing cultural relations in multinational society are more affordable methods to establish tolerant society". During last years, international events held in the territory of the republic prove development perspectives of international tourism in Azerbaijan and allows for new opportunities in tourism field.

5. TOURISM REQUIREMENT BY SOCIAL GROUPS

As tour operators say, the main part of tourist flow visiting Azerbaijan is comprised of independent travellers (almost the ones who conduct individual trips) as well as business travellers. Nevertheless, they notice that a classic tourist flow from Russia to Azerbaijan increases year after year and Azerbaijan becomes more popular. The number of tourist more than 7% in 2017 visited resorts of Azerbaijan comparing in 2016. Many tourists prefer recreational organized in Azerbaijan, because in this case hotel reservation, purchase of air-flight tickets and solution of insurance problems are not required. Price of package tours may be cheaper than the price of independent recreation. During the recent years, Azerbaijan has a great effort for development of tourism sector of the country: infrastructures of resorts improve, modern residences (dwelling facilities) and various areas of tourism increase. Currently, the country offers curious excursion routes, sanatory-resort and beach recreations, and modern mountain ski routes. Tour operators foresee the direction of well perspectives. So that touristic operator ICS Travel Group plans to expand its activity, to apply new tourism programs and hotels-reservation service for tourists. Popularization of beach resorts of Russia in Azerbaijan has also been recorder by experts of ALEAN tour operator. Tour operators among the most famous ones from such kinds of places for tourists mention Novkhani, Shikhov, Bilgah resort settlements. The average price of a 7-day tour per person last summer became in amount 35,000 rubles (such as feeding). According to the information of "Russian expression", tourists use the short-term tours in recreations and on holidays. This causes the cheap routes from different cities of the country. "Therapeutic tourism in Azerbaijan is also popular among clients of therapeutic tour operator "Naftalan resort" having non-analogue" experts of "Russian Express" denotes.

ALEAN National tour operator totally meets requirement of Russian sanatoriums, especially of sanatory-resorts treatment in Naftalan. Average period of recreation in Naftalan lasts 10-14 days. Due to the information of the Ministry of Culture and Tourism of Azerbaijan, general number of foreign tourists visiting the country during 10 months in 2017 was 2, 27 million people by ascending 20,1%. In relation with analogical period of the final year, Russia, Iran and United Arab Emirates were among the countries indicating more increase at tourist flow. In this case, tourists from Russia prevail or hold the first place comparing "their competitors" with great difference: 727 577 of Russian citizens have visited Azerbaijan from January to October. The above-mentioned number of these tourists is 30%. Tourists from Georgia take the second place (439 305 tourists). Then it follows with Iran (320 904), Turkey (249 210), United Arab Emirates (81 742), Iraq (54 242), Ukraine (49 809) and Saudi Arabia (31 821).

6. DEMOGRAPHIC CONSISTENT AND HUMAN POTENTIAL OF TOURISM IN REGIONS

Demographic situation in Azerbaijan is specified with significant differences in nature of natural restoring character of the people on various regions. There exist high level of parity (birth rate) of population reproduction in the demographic development (2013, 18%) of the country, low death level (2103, 6,3%), the continuous decrease of parity (birth rate) as a significant growth of population and workforce besides available circumstances, stabilization of death phase, increase of death phase at several groups of age due to certain reasons, reduction of average life period in rural regions, tendencies like weak area of people and professional movement. The current demographic situation in Azerbaijan ensures higher growth rates of people and labour resources than the Caucasian republics. Hereby, the number of Georgian population has dropped to 400 thousand people, Armenian population 750 thousand people and Azerbaijani population 750 thousand people. High growth of population is mainly considerer to rural areas, which is provided by a number of social, economic and psychological factors, the living and working conditions of the population resided there, and stable reproductive traditions and relevant reproductive instructions. Though the rural population absolutely increases, its share in the number of the country's population gradually decreases. The increase in the number of rural population is related to the parity, which is more than in urban areas (1.2 times) as a rule, but is also observed by a high rate of decrease in comparison with the city. This case is initially construed by the high level of urbanization (the proportion of urban population in Azerbaijan was 51.7% in 2013) and the expansion of effect of urban lifestyle on the village. The structure of the rural population is formed due to the influence of national traditions, the high rate of parity, poor migration stability, and the low index in divorce determine the number of families with three or more children (2,15 in urban areas, 2,52 in rural areas). In modern situation, an equalizing process of parity between urban and rural regions is sufficiently regular in all economic regions. If the urban population was 7.1 more in 1990, it was 2.6 (1000) in 2013. But in some regions the decrease level was lower than in urban areas due to some social factors and economic reasons. Within period of the reporting, the decrease of the general reproduction ratio of the rural population occurred more intensive than the urban population. Hereby, reproduction ratio of urban population has decreased 30,7% within 1994-2013 and 40% in rural area. The study of this problem reflects the natural process of decreasing parity in rural areas that this indicates a transition to a new lifestyle and population reproductive samples, and this is a result of social-economic factors covering not only structural and demographic (age structure of women in fertility, gender and marriage structure, divorce ratio, migration), but also the material and spiritual level of life, the women's employment in production, their ethnic affiliation, and et cetera. Participation of women in labour life and education level are the factors defining their generative interaction. Census and analysis of social resources in 1999 indicate that women with children from unemployed people in rural regions are more, most of

them are local people (90% manpower working in housing). Women's employment in production is one of the significant factors that have an effect on decrease of fertility level. High rate of the generated demographic situation and women's labour resources are conditioning the need to enhance employment field of women in rural area. In other sense, they require improvement of non-productive field, trade and service area, health, children's and pre-education institutions in regions where parity is more. So this is necessary for solution of involvement problem of woman's labour in manufacturing. Study of tendencies in the anticipated life period (life expectancy) between urban and rural population constitutes the first situation to complete the purposed demographic policy in regions. Because, this actually specifies the gained living level or standard, and reflects several factors that have an effect on people's health and work (life and labour condition). As urbanization is improved, the significant progresses happen on elimination of differences between cities and villages in Azerbaijan and at the same time, the problems arise in regard with the social-hygienic and other living places. Comparison of average life expectancy indicators proves the existence of two controversial tendencies recorded in urban and rural regions. Especially during this period, this is decreased in villages increasing in the cities. But the existing diversity (8,4 years) between village and city during the anticipated life period was totally eliminated at recent times and had a little diversity (0,2 years). Convergence of the general indicators of death and birth rate of urban and rural population allows us for judging or reasoning on some advantages and drawbacks (deficits) of rural lifestyles. So, the significant progress in reduction of child's death rate was recorded in the cities. Its level depends on the most social-economic development factors: existence of professional medical aid, childcare facility, development of dwelling places and material situation of family with child. The working nature of the employing people, its professional status significantly affects the mortality rate. Exploration shows that mortality or death rate between the people engaging with manual labour is more than the people involving in mental labour. But men and women engaging with mental work has more mortality rate in rural areas comparing with those in the city. But this mortality rate is more among the people engaging with manual labour adversely in the villages. This case in women is more than men. As result, it is related to the more affordable effect on woman's healthcare with strenuous situation of agricultural labour. Future development of agriculture in the participation of rural people at non-agricultural sector will require attention to the problems on the attainment of necessary knowledge and experience on industrial labour of youth, an adaptation of apportioned labour resources to requirements of industrial and constructional production and enhancement of employees' level in education. The certain impact on decrease of living standards in rural areas is associated with the migration of young people (mainly of men) to cities. The reason of this process is related with the social-economic development of rural areas as well as a lag of the industrial and social infrastructural level. Hereby, this leads the age of rural population to be relatively deteriorated and its aging, and consequently causes to increase of general mortality rate. Unadjusted flow of rural people has a negative effect on growth in population particularly within high labour activity. Urban population, especially growth of death possibility after the age of 30 among men is construed with high density of people, stresses, pollution of environment and others. It is known that large-scaled technology increases demand to the especially employees of high mechanised and the advanced speciality. At the same time, the suitable conditions are created for the spread of neurogenic diseases, namely, cardiovascular, psycho-neurological and oncological diseases under the circumstance of urbanized environments. If the level of needs is provided and the temporary fund leaves behind the increased power consumption, in other sense, workforce is not completely restored, an employee's health will be spoiled and his/her disease and death risk will rise. Lower death phase of village residents and relatively long-life period is a gathering factor and informs on priorities of rural lifestyle contributing to recovery of health and causing to longevity.

At the same time, the seasonality of agricultural works is selected for a deficit of high-quality medical assistance, lower cultural levels and lack of common sanitarian-hygienic behaviors comparing with a city. Improving healthcare of people, especially the working people, and reducing economic losses is one of the most important issues of demographic policy. Rational concentrations of industrial production in small and medium cities will become more eminent in future, and will be shaped to economic and cultural centres where the opportunities will be created to combine the village of favourable living conditions with the urban environment. Growth of modern agricultural production dictates new requirements to employee's quality. In its turn, a rise of possible labour conditions and labour charges, creation of condition to evolve employees' physical and spiritual abilities more completely, increase of production profitability and elimination of diversities between mental and physical labours equalize a living level of rural and urban population.

7. ANALYSE OF SOCIAL STATUS OF TOURISM EMPLOYEES

The Ministry of Youth, Sports and Tourism of the Republic of Azerbaijan fulfils consecutive works aimed to expand corporation in international tourism field. Firstly, the Republic of Azerbaijan was adopted as full-fledged member to the World Tourism Organization in September, 2001. This granting the right to vote in General Assembly of the WTO, to participate in all events of this organization, and using the experience of leading countries in tourism field bestowed an opportunity to integrate into world tourism society. Multi-purposed relations in tourism field in corporation with membership of the World Tourism Organization are established and contributed by Organization of the Islamic Conference, Organization of the Black Sea Economic Cooperation, GUAM, Economic Corporation Organization, ESCAP (Economic and Social Commission for Asia and the Pacific), Organization for Economic Cooperation and Development-OECD, tourism council of Commonwealth of Independent States and other regional and global organizations. For instance, the representatives of the ministry of youth, sports and tourism have participated in the 15th Beijing session of General Assembly of the World Tourism Organization, in the conferences of ministers of Organization of the Islamic Conference in Saudi Arabia and Malaysia and the meetings held by working groups of the countries of Organization of the Black Sea Economic Cooperation. Considering special role of personnel and their proficiencies to develop tourism in modern age, this issue has always been in centre of attraction of the ministry. Representatives of private sectors with collaborators of the ministry as well as students of relevant universities attend the course (intensive) on training of employees working in tourism field. In consideration of those mentioned above activity of TIKA, the Turkish company should be noted that the ministries constantly cooperate in this field. Regarding the development of tourism, the establishment of a new tourism infrastructure in the regions, attraction of local and foreign investors to the regions, the establishment of new tourism institutions and opening of new jobs for the people on these bases are among the priorities of the Ministry of Youth, Sports and Tourism. To the end, collaborators of the head department in tourism employees have been assigned to 30 promising regions of the country, studied the landscape, and developed schematic maps to establish new tourism types in relation with development of tourism in regions. This work was summed up on the 15th of March in 2005. The next step intends to develop tourism zones and to attract investments to these zones. Besides, legal base should be founded and adopted relating to the events above mentioned for rationalization and maximal use of tourism zones and local opportunities by reckoning environment. The main criterion to use zones will be a development and betterment of social-economic status of regions. The richness and diversity of the regions make the extensive opportunities to develop different types of tourism. But local people having been involved in ecotourism for a long period, have spontaneously used this opportunity by offering accommodation, food, and sometimes excursion services for local and foreign tourists.

It is necessary to notice that incomes from ordinary business are not also earned by village residents who receive tourists but also by other residents of the village. This is because that neighbour villagers have a chance to offer to tourists their own agricultural products works of art.

8. CONSLUSION

Applying tourism in Azerbaijan we can come to conclusion that this sector has a priority in its essence in the country. The leadership of our country takes all necessary measures for the development of tourism by taking into consideration that the profitable development of any field demands for state support. These are included the adoption of the aimed programs, declaration of decrees, the opening of hotels, advertising of tourism potential of the country, participation in international events and etc. Increase in number of tourists leads to open new workplaces and rise of population. In the result, development of tourism industry enhances social-economic level of the country. Thus, Azerbaijan should maintain to develop tourism industry. To use experiences of countries that become a leading field of economy of tourism industry is offered for this reason.

LINKING INNOVATION AND NATIONAL COMPETITIVENESS

Rozana Veselica

Business School PAR, Rijeka, Croatia

rozana.veselica@gmail.com

ABSTRACT

Today, companies and countries live in a fast changing and dynamic business environment. Being competitive and innovative is one of the main aims of each business and national economy. The quest for competitive advantage becomes even more crucial when we consider the strong impact of globalisation and the ongoing 4th Industrial Revolution. The author will be investigating the connection between innovation and competitiveness, accordingly to the global competitiveness index. Innovation will be defined based on the most recent 4th edition of the Oslo manual "An innovation is a new or improved product or process (or combination thereof) that differs significantly from the unit's previous products and processes and that has been made available to potential users (product) or brought into use by the unit (process)." (OECD, Oslo manual, 4th Edition, 2018, p. 20.). In the paper competitiveness will be defined as "the set of institutions, policies and factors that determine the level of productivity of a country" as defined by The World Economic Forum (WEF), which has been measuring competitiveness among countries since 1979. Thought it's Global Competitiveness Index (GCI) The World Economic Forum assesses the competitiveness of 140 countries, providing valuable insights of each economy. Innovation and innovation activities are becoming one of the most important factors into achieving sustainable competitive advantage. In this paper the author will collect, compare, analyse and deduct the main indicators for competitiveness and innovation for the selected national economy - The Republic of Croatia. Competitiveness and innovation will also be analysed in terms of regional competitiveness based on the last EU Regional Competitiveness Index for 2016. The paper will investigate and furthermore analyse the strong linkage found between innovation and competitiveness for the selected national economy case.

Keywords: *competitiveness, competitiveness index, innovation, regional competitiveness, sustainable competitive advantage*

1. INTRODUCTION

Today, companies and countries live in a fast changing and dynamic business environment. Being competitive and innovative is one of the main aims of each economy. The quest for competitive advantage becomes even more crucial when we take in consideration the strong impact of globalisation and the new industrial revolution. Innovation and innovation activities are becoming one of the most important factors into achieving sustainable competitive advantage. In this paper the author will analyse, compare and deduct the innovation and competitiveness main indicators for the Republic of Croatia. Innovation will be defined as from the last Oslo manual (2018) and competitiveness will be defined through the Global Competitiveness Index and it's main twelve pillars. Innovation and competitiveness will be more overly analysed and connected thought the Global Competitiveness Index for Croatia and it's Innovation Ecosystem Pillar's including business dynamism and innovation capability factors for the Croatian national economy. EU Regional Competitiveness Index will also be taken into consideration and analysed based on the selected NUTS regions. The impact of innovation and it's connection with competitiveness indicators will be more overly analysed and investigated through the case of the Croatian national economy.

2. INNOVATION

What is innovation? When we analyse and define innovation, our guideline will be the Oslo's manual for measuring innovation which defines innovation and innovative activities. The Oslo manual is one of the most important international source of guidelines for the collection and use of data related to innovation activities in companies. The Oslo Manual had four editions until today: in 1992, 1997, 2005 and the most recent one published in October, 2018. "The first version of the Oslo Manual, issued in 1992, and the surveys undertaken using it, notably the Community Innovation Survey (CIS) organised by the EC, showed that it is possible to develop and collect data on the complex and differentiated process of innovation. The second edition of the manual takes the original framework of concepts, definitions and methodology and updates them to incorporate survey experience and improved understanding of the innovation process and also to take in a wider range of industries. It provides guidelines by which comparable innovation indicators can be developed in OECD countries, and discusses the analytical and policy problems to which the indicators are relevant. The Manual has two objectives: to provide a framework within which existing surveys can evolve towards comparability; and to assist newcomers to this important field." (OECD, Oslo Manual 2nd Edition, 2005, p. 6.) In the third Manual Edition innovation and the minimum innovation requirements are defined as follows. "An innovation is the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organisational method in business practices, workplace organisation or external relations." (OECD, Oslo manual, 3rd Edition, 2005, p. 46.) "The minimum requirement for an innovation is that the product, process, marketing method or organisational method must be new (or significantly improved) to the firm. This includes products, processes and methods that firms are the first to develop and those that have been adopted from other firms or organisations." (OECD, Oslo manual, 3rd Edition, 2005, p. 46.). The new 4th edition of the Oslo manual redefine the definition of innovation. "An innovation is a new or improved product or process (or combination thereof) that differs significantly from the unit's previous products and processes and that has been made available to potential users (product) or brought into use by the unit (process)." (OECD, Oslo manual, 4th Edition, 2018, p. 20.) The main difference between the last edition and the previous one's is the reduction of four innovation types to two main innovation types: product innovations and business process innovations. "A product innovation is a new or improved good or service that differs significantly from the firm's previous goods or services and that has been introduced on the market. A business process innovation is a new or improved business process for one or more business functions that differs significantly from the firm's previous business processes and that has been brought into use by the firm." (OECD, Oslo manual, 4th Edition, 2018, p. 21.). In this paper the author will refer to innovation mostly as it is defined by the Global Competitiveness Report, published by the World Economic Forum in 2017-2018. The competitiveness is measured by twelve pillars, where innovation is measured through the Innovation Ecosystem environment - analysing Business Dynamism and Innovation Capability in its 11th and 12th pillar. The pillar will be furthermore explained in the innovation and competitiveness section of this paper.

3. COMPETITIVENESS

What competitiveness is in today's turmoil economies? There are many definitions of what competitiveness is, in this paper we will define competitiveness as "the set of institutions, policies and factors that determine the level of productivity of a country" as defined by The World Economic Forum (WEF), which has been measuring competitiveness among countries since the year 1979. (World Economic Forum (WEF), 2016, <https://www.weforum.org/agenda/2016/09/what-is-competitiveness/>). Through its Global Competitiveness Index (GCI) The World Economic Forum assesses the competitiveness of 140 countries, providing valuable

insights of each economy. “There are a total of 98 indicators in the index, derived from a combination of data from international organizations as well as from the World Economic Forum’s Executive Opinion Survey. These are organized into 12 pillars in the GCI 4.0, reflecting the extent and complexity of the drivers of productivity and the competitiveness ecosystem. These are: Institutions; Infrastructure; ICT adoption; Macroeconomic stability; Health; Skills; Product market; Labour market; Financial system; Market size; Business dynamism; and Innovation capability.” (WEF, The Global Competitiveness Report, 2017-2018, p. 9.) According to the GC Report, United States o America, Singapore, Germany, Switzerland and Japan are the World’s most competitive countries - when measured as by the Global Competitiveness Index. All five of them are ranked equal as in 2017, except Japan - which raised for three positions, improving it’s competitiveness index in just one year. Croatia is ranked 68th, decreasing it’s position for two places compared to year 2017. Croatia is the 68th most competitive nation in the world, according to the recent Report. Here is the statistics for Croatian Competitiveness Index trend from 2007 to 2018. (Trading Economics Website, Croatia Competitiveness Rank, <https://tradingeconomics.com/croatia/competitiveness-rank/>)

Figure 1: Croatian Competitiveness Trend
(Trading Economics Website, Croatia Competitiveness Rank,
<https://tradingeconomics.com/croatia/competitiveness-rank/>)

As it is visible from the Figure, Croatia is fast growing and becoming more and more competitive. During the last 2 years Croatia had the highest Competitiveness Index in the last 8 years. Before the global recession, Croatia was at it’s peak, ranked as the 57th country (Trading Economics Website, Croatia Competitiveness Rank, <https://tradingeconomics.com/croatia/competitiveness-rank/>). When we compare Croatia to other EU members, based on the Global Competitiveness Index it is also visible the lower competitiveness ranking position. The most competitive countries in Europe in general, according to the GCI are Germany, Switzerland, Netherlands and United Kingdom. Serbia, Croatia, Montenegro, Albania, Ukraine, Macedonia, Moldova and Bosnia and Herzegovina are ranked as the less competitive countries in Europe - based on the same Global Competitiveness index Report for 2017-2018. The second Figure shows their ranking for today and for the previous competitiveness report.

Figure following on the next page

Serbia	65.00	Dec/18	70
Croatia	68.00	Dec/18	66
Montenegro	71.00	Dec/18	73
Albania	76.00	Dec/18	80
Ukraine	83.00	Dec/18	89
Macedonia	84.00	Dec/18	68
Moldova	88.00	Dec/18	87
Bosnia and Herzegovina	91.00	Dec/18	90

Figure 2: Competitiveness Rank - The Less Competitive European Countries
 (Trading Economics Website, Croatia Competitiveness Rank,
<https://tradingeconomics.com/croatia/competitiveness-rank/>)

The less competitive European country is Bosnia and Herzegovina, falling one more position from the previous GCI ranking edition from position 90th to 91st, Moldova was also ranked as 87th and in the recent edition is ranked 88th. Macedonia was ranked 68th and in this GCI edition falls for 16 places to the 84th position. Ukraine was ranked 89th, today is ranked 83rd, Albania was ranked 80th and today increased the rank for 3 positions to the 83rd place. Montenegro was 73rd and today is slightly more competitive holding the 71st position. Croatia was as previously told ranked 66th and today is ranked as 68th. Serbia increased the competitive position raising from the 70th place to the 65th position among 140 countries included. Competitiveness Index as already highlighted, is based on 12 pillars, which are divided among four basic ones: enabling environment, markets, human capital and innovation ecosystem. Croatia is ranked 63rd by Innovation Capacity Pillar, and 81st by Business Dynamism Pillar. Each of those pillars will be investigated more deeply in our further analysis. It is also visible that the best ranking position is held from the field of Enabling Environment Pillar - Infrastructure, where Croatia is 36th among the 140 countries included. Here is the complete ranking for Croatian pillars and Global Competitiveness Index for 2017.-2018.

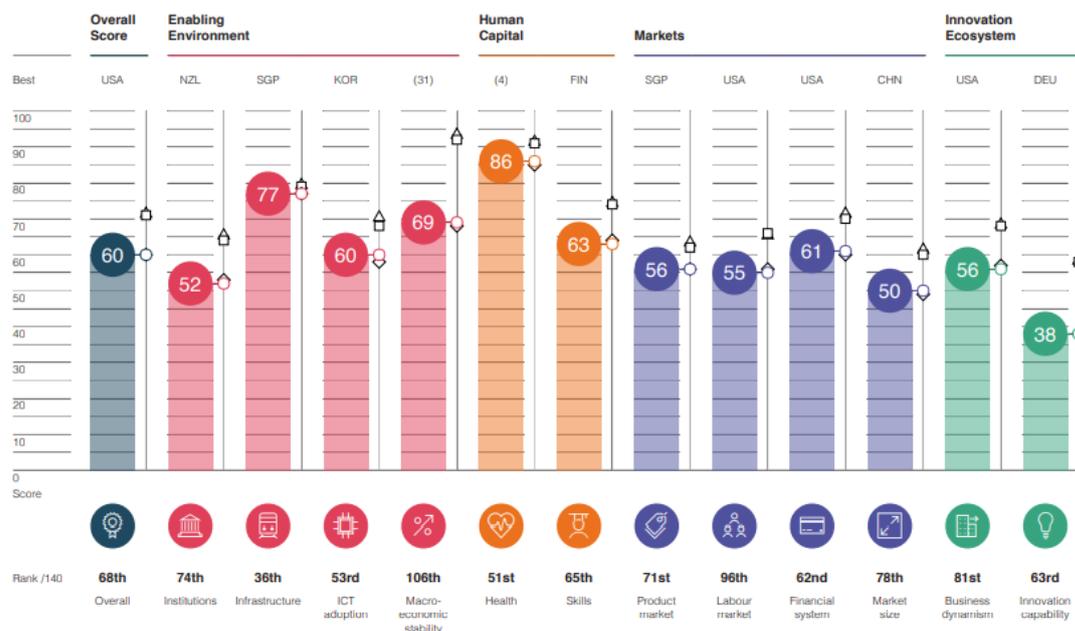

Figure 3: The Global Competitiveness Index - Croatia
 (WEF, Global Competitiveness Index 2017-2018, p. 179.)

From the Global Competitiveness Index for Croatia it is visible the score for each competitiveness pillar as well as the ranking for each of them, compared to the other 140 countries included in the index. The ranking for Enabling Environment pillars are: Institutions is scored 52 and ranked 74th, Infrastructure is scored 77 and ranked 36th. ICT adoption is scored 60 and ranked 53rd, Macroeconomic stability is scored 69 and ranked 106th. Human Capital pillars are Health, scored 86, ranked 51st and Skills scored 63, ranked 65th. Market pillars are Product market, scored 56, ranked 71st, Labour Market scored 61, ranked 62nd, Financial System scored 61, ranked 62nd, and Market Size scored 50, ranked 78th overall. Innovation Ecosystem pillar in terms of Business Dynamism is scored 56, ranked 81st and in terms of Innovation Capability is scored 38th, ranked 63rd - which is also one of the best scores for all 12 pillars included in the competitiveness measurement. The United States of America and Germany are ranked as 1st overall in terms of innovation ecosystem competitiveness pillar.

4. INNOVATION AND COMPETITIVENESS

Innovation is one of the key factors in achieving competitiveness and gaining sustainable competitive advantage. Innovative ideas and new ways of doing business are commonly accepted as one of the most important factors for success. The connection between innovation and competitiveness will be furthermore analysed based on the findings and statistics of the Global Competitiveness Report. In the terms of Innovation Ecosystem Pillar, as it was already mentioned, Croatia is ranked 81st in terms of Business Dynamism, and 63rd in terms of Innovation Capability. It is visible Croatia has a great potential in innovation activities but it still has to work on the attitudes toward entrepreneurship, willingness to delegate authority and in the growth of innovative companies. Regarding Business Dynamism, the best ranked factor is insolvency regulatory framework ranked 28th and the worst one is attitude toward entrepreneurship ranked 137th out of 140 countries. The Innovation Capability Pillar best ranks is for international co-inventions ranked 42nd and the worst one is for multi-stakeholder collaboration ranked 134th as well as diversity of workforce ranked 133rd. The Innovation Ecosystem Pillars are shown on the following figures about Business dynamism and Innovation capability. Business dynamism pillar and the Croatian score and ranking for each of them is shown on the following Figure.

 Pillar 11: Business dynamism 0-100 (best)	-	55.7 ↑	81
11.01 Cost of starting a business % GNI per capita	7.2	96.4 ↓	69
11.02 Time to start a business days	7.0	93.5 =	41
11.03 Insolvency recovery rate cents/\$	32.7	35.2 ↑	81
11.04 Insolvency regulatory framework 0-16 (best)	12.0	75.0 =	28
11.05 Attitudes toward entrepreneurial risk 1-7 (best)	2.9	32.1 ↑	137
11.06 Willingness to delegate authority 1-7 (best)	3.6	42.7 ↑	122
11.07 Growth of innovative companies 1-7 (best)	3.3	38.2 ↓	123
11.08 Companies embracing disruptive ideas 1-7 (best)	2.9	32.4 ↑	128

Figure 4: Global Competitiveness Index 2017-2018 - Croatia - Innovation Ecosystem Pillars - Business Dynamism (WEF, Global Competitiveness Index 2017-2018, p. 181.)

The second Innovation Ecosystem Pillar is Innovation Capability and it is shown on the following Figure, together with the score and ranking for each factor included.

Figure following on the next page

💡 Pillar 12: Innovation capability 0-100 (best)	-	37.7 ↓	63
12.01 Diversity of workforce 1-7 (best)	3.3	38.9 ↑	133
12.02 State of cluster development 1-7 (best)	2.8	30.4 ↑	130
12.03 International co-inventions applications/million pop.	1.15	23.53 ↓	42
12.04 Multi-stakeholder colLabouration 1-7 (best)	2.8	30.8 ↑	134
12.05 Scientific publications H Index	226.0	80.3 ↓	46
12.06 Patent applications applications/million pop.	5.01	32.94 ↓	44
12.07 R&D expenditures % GDP	0.9	28.5 ↓	44
12.08 Quality of research institutions index	0.01	3.63 ↓	57
12.09 Buyer sophistication 1-7 (best)	2.7	28.6 ↑	117
12.10 Trademark applications applications/million pop.	1,593.72	79.33 ↓	44

Figure 5: Global Competitiveness Index 2017-2018 - Croatia - Innovation Ecosystem Pillars - Innovation Capability (WEF, Global Competitiveness Index 2017-2018, p. 181.)

The most problematic factors for doing business in Croatia, according to The World Economic Forum (2017-2018) are: inefficient government bureaucracy, policy instability, tax regulations, corruption, tax rates, insufficient capability to innovate, access to finances, restrictive labour regulations, inadequately educed workforce. Croatia will have to put more effort into improving those factors and one of the possible keys for doing that can be found in innovation and innovation activities. When we compare Croatia to Europe and North America GCI average, the situation becomes even more visible. The following diagram is showing the lack of innovativeness capability and business sophistication in 2016. and the gap between Croatia and Europe/North America (the grey line on spider diagram, Figure 6.).

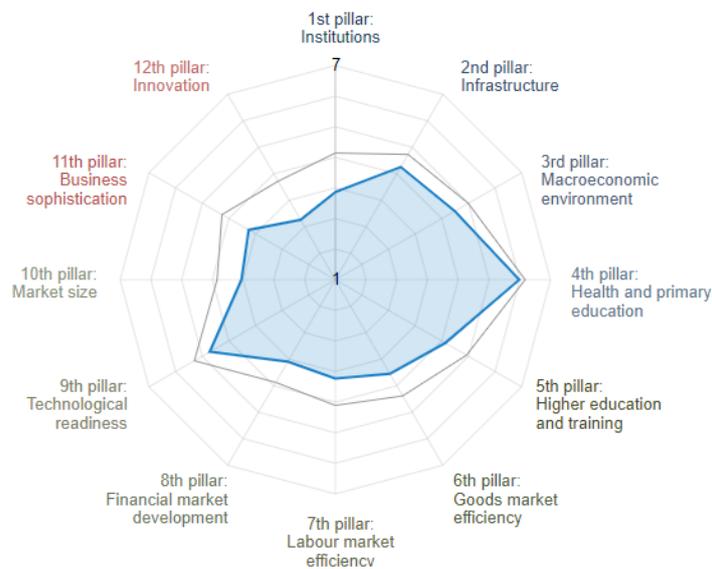

Figure 6. Croatia / Europe-North America - GCI gap
 (World Economic Forum, Global Competitiveness Index Croatia 2017-2018,
<http://reports.weforum.org/global-competitiveness-index-2017-2018/countryeconomy-profiles/#economy=HRV>)

Croatia must facilitate administrative procedures, enable better conditions regarding taxation policies and encourage the transfer of technology, knowledge and innovation (WEF, Global Competitiveness Report, 2017-2018). In terms of regional competitiveness, Croatia is also struggling to approach the EU average. One of the most important regional competitiveness indicator is presented by the European Regional Competitiveness Index (EURCI). "Regional competitiveness is the ability of a region to offer an attractive and sustainable environment for

firms and residents to live and work. Launched in 2010 and published every three years, the Regional Competitiveness Index (RCI) allows regions to monitor and assess their development over time and in comparison with other regions.” (European Commission Directorate-General for Regional and Urban Policy, https://ec.europa.eu/regional_policy/en/information/maps/regional_competitiveness/#3). “The RCI builds on the approach of the Global Competitiveness Index by the World Economic Forum. It covers a wide range of issues including innovation, governance, transport and digital infrastructure, and measures of health and human capital. A growing number of regions use it to identify their strengths and weaknesses and shape their development strategies.”(European Commission Directorate-General for Regional and Urban Policy, https://ec.europa.eu/regional_policy/en/information/publications/working-papers/2017/the-eu-regional-competitiveness-index-2016). The 2016 index is based on 74 mostly regional indicators covering the 2012-2014 period, but with a number of indicators from 2015 and 2016. It is important to accent that the European Regional Competitiveness Index is based on analysing factors of effectiveness, basic competitiveness and as the third one - innovation factors. Innovation capability is becoming more and more important and it is identified as one of the most important and relevant factors for achieving sustainable competitive advantage. The ones who will understand the importance of constant innovation will be the ones who will become and remain leaders on the market. One of the main goals of the countries should also be to assist the market in order to achieve that sustainable competitive advantage they all wish to gain (EU Regional Competitiveness Report, 2016). It is now notable Croatia is among the lowest developed regions in terms of EU regional competitiveness. The regional competitiveness in Croatia is divided among the two NUTS regions - Adriatic and Continental Croatian Region. Out of 263 EU regions, Adriatic Region is at the 222nd place and Continental Region at the 220th - for year 2016. Croatian regions are still lacking competitiveness in terms of market size, infrastructure but as well innovation. In this paper the author will consider the Adriatic NUTS region when analysing regional competitiveness. The following spider diagram shows Croatian regional competitiveness score, compared to the EU average. Croatia (Blu line -EU avg, Red line - Croatian avg, Green line - Adriatic NUTS avg).

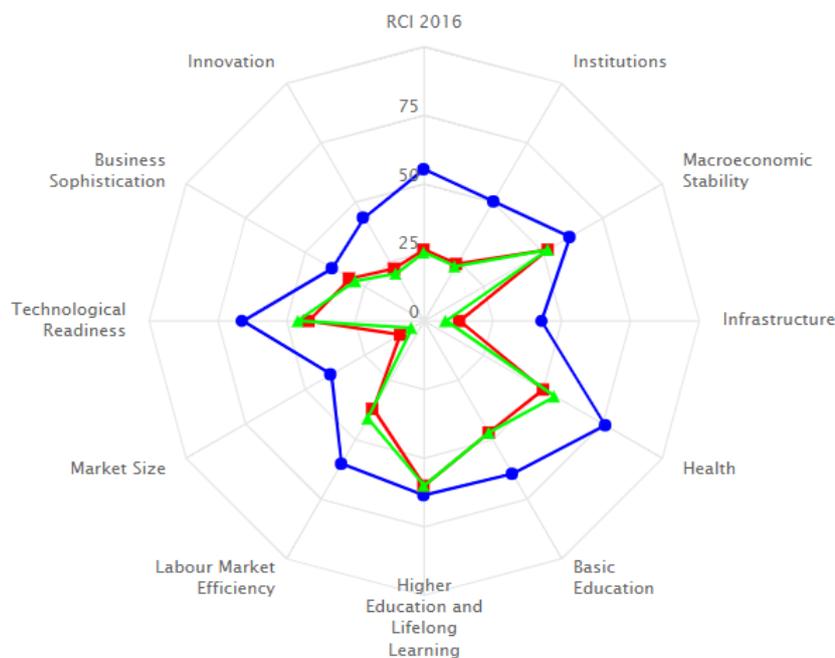

Figure 7: EU Regional Competitiveness Index 2016 (EURCI) - Croatia
 (European Commission Directorate-General for Regional and Urban Policy,
https://ec.europa.eu/regional_policy/en/information/maps/regional_competitiveness/#3)

From the EU Regional Competitiveness Index it is visible that the two Croatian NUTS regions are almost equally competitive but when they are compared to the EU regional average, the lack of competitiveness is highlighted, especially concerning institution, infrastructure and market size competitiveness pillars. Croatian regions are most competitive and closer to the EU average regarding the business sophistication, macroeconomic stability, innovation and higher education and lifelong learning competitiveness pillars. In terms of Innovation Dimension the Adriatic region is ranked 196th from 263 regions, according to RCI 2016. Innovation Dimension is based on - Technological readiness 193rd, Business Sophistication 178th and Innovation 207th. The Basic Dimension containing institutions, macroeconomic stability, infrastructure, health and basic education is ranked 228th. The Efficiency Dimension containing higher education, lifelong learning, labour market efficiency and market size is ranked 215th. It is visible from the spider diagram the discrepancy between the average Croatian regional competitiveness index, for the Adriatic NUTS region and the EU average based on the EU Regional Competitiveness Index. The EURCI for the Adriatic NUTS region is very close to the Croatian regional average for the regional competitiveness index, but there is a huge gap between the both of them and the EU regional competitiveness average.

5. CONCLUSION

The quest for competitive advantage becomes more and more important, and the accent on the sustainable competitive advantage becomes crucial. National economies and other business entities struggle on daily basis to find the right balance between in time predicting and adapting to changes. One of the key factors into achieving sustainable competitive advantage is innovation and innovation activities. Only constant innovation and permanent seek for new ideas and new ways of improvement, are generating sustainable competitiveness. National economies needs to be agile in fast changing business environment and constantly improve their selves, as well as constantly seek for new opportunities and new challenges. As it is visible from the Oslo Manual, Global Competitiveness Report, EU Regional Competitiveness Report and many others not investigated in this paper, innovation is becoming highlighted and often extracted as one of the main indicator and key driver of competitive advantage. Innovation is researched and analysed as one of the crucial activities for obtaining and preserving the sustainable competitive advantage for national economies and business entities as well. In this paper the author investigated the linkage between national competitiveness and innovation, and accented the correlation between the competitiveness ranking and high innovation and research performance. If the trend of the Croatian economy indicators, showing a slightly increase in innovation and business sophistication factors will continue, it is also possible to expect a slight increase of Croatian Global Competitiveness ranking for the upcoming GCI report. Also, the regional competitiveness indicators are showing the similar slight improvement in innovation capability factors for the two NUTS regions. If Croatia continues to research and improve on different innovation activities, it is possible it will positively affect the overall competitiveness ranking and enhance or at least detain the national economic growth.

EFFECTIVE UTILIZATION OF HUMAN POTENTIAL AND LABOR PRODUCTIVITY

Alirza Israfil Mammadov

Associate Professor at Azerbaijan State University of Economics (UNEC)

alirza.mammadov@unec.edu.az

ABSTRACT

The development and effective use of human potential, the leading role of the education system in this process is revealed in the article. The role of rational use of human potential in raising productivity in market conditions was justified. The importance of human potential in improvement of labor productivity, sustainable socio-economic development of the country, enhancement of competitiveness of production and service sectors, integration into global markets are studied. The impact of issues such as raising quality in all levels of education, development of employees' knowledge and skills through various trainings, and adaptation of qualified personnel to labor market requirements have been explored for the development of human potential. The article focuses on two major issues: 1) the elevation of quality in all levels of education for the formation and development of human potential; 2) stimulation of investment in stable development of labor potential for increasing labor productivity. The wide range opportunities for improving labor productivity in Azerbaijan as a key issue for promoting investment in human potential to increase labor productivity in all spheres covered by the Strategic Road Map on main sectors of the national economy is researched in the article. The role of internal and environmental factors in the realization of human potential is high. In developing and realizing this potential, The person himself, his family, the company where he works, and ultimately the region or the country should be interested with his life. All this shows that for the realization of human potential, human development should be invested in the micro, meso and macro levels.

Keywords: *education level, human capital, human potential, labor productivity, living standards*

1. INTRODUCTION

According to the human capital concept, the key to the development of modern information society and innovative economy is human, it's potential. It means that human potential is a key factor in sustainable and constant development in the country, the competitiveness of the labor force, and ultimately, the improvement of the living standards of the population. This theory is based on the "creative human" model and behavioral principle that is different from the traditional classic theory of the "economic human". Based on this model, it is based on realizing its creative potential and developing its personal qualities. This reflects the paradigm and principles of the creative economy. Human potential plays an exceptional role in raising labor productivity, sustainable socio-economic development, and integration of the state into global markets. Human potential ultimately shows itself in concrete labor activity, takes place and reflects the labor resources of firms and the country as a whole under equal conditions. Human resources are used by considering the employee's potential and personal qualities. This means that human resources should be adequate to human potential in terms of its application. The effectiveness of each country's employment policy affirms itself in creating the conditions for full and productive use of its human potential. It is also true that, in the developed countries, the funds invested in human resources are more effective compared to the investments in other areas.

2. THEORETICAL FOUNDATIONS OF HUMAN POTENTIAL

The theory of "human capital", which can perfectly describe the essence and content of modern information society and the innovative economy, has been created in the late 20th century. Its foundations were created by American economists G. Becker and T. Schultz, and therefore awarded the Nobel Prize. According to Becker, human capital is personal qualities affecting the flow of money generated by human beings. In economic research and literatures, human capital is generally interpreted as a combination of personal qualities, such as its ability and abilities, to influence the effectiveness of human labor" (9, p.417). While saying effective utilization of human capital, the individual human capital is primarily intended. "Individual human capital is the accumulated knowledge, skills, motivations, abilities, and health resources that have been created as a result of investment and the productivity and income of its labor." In the concept of human capital, the value of the workforce, the cost of labor force is based on the model of ordinary commodities. But the cost and cost of the labor force are not the cost value of the commodity (4 p. 257), in some cases, the concepts of "human capital", "labor potential", "labor force" and "labor ability" are identified together. So, M. Bukhalkov states: "... Labor force is the sum of the physical, intellectual and professional qualities of a person"; "Human capital is the sum of personal qualities of employees"; "Labor potential is an effective labor productivity"; "Labor potential is closely related to human capital, and its prime cost is the price of a labor force" (12: 29-30). Another author considers that human capital is the "capitalized value" of the cumulative workforce (14th, 116th). But, A. Alaverdov states that "Human capital demonstrates the development of the workforce, the formation and improvement of the work ability" (13th, 497). Human potential plays an exceptional role in raising labor productivity, raising competitiveness of production and service sectors in sustainable socio-economic development, and integrating the state into global markets. It is therefore important to improve quality in all levels of education through the development of employees' knowledge and skills through various trainings, bringing qualified workforce training into line with the labor market, encouraging firms to invest in research and development, and rational use of existing human capital. Therefore, it is crucial to carry out extensive measures to ensure continuity in the development of human capital, to increase labor productivity and increase the role of knowledge in economic development, as a major component of the reforms to transform the economy. The two main problems in these directions should be in focus:

1. Improving the quality of education at all levels for the formation and development of labor potential;
2. stimulation of investment in sustainable development of labor potential to provide the increasement of labor productivity

The employee's labor potential is related to the ability for engaging in labor activity. Labor potential is given to human beings both genetically and in the natural order, i.e. education, professionalism, creativity, knowledge, experience, business activity, etc. is formed through. Families, labor collectives and the state play an important role in formation and realization the labor potential. The labor potential of the employees is based on the labor potential of the labor collectives and society. But the quality of the workforce does not mean everything at all. UNEC professor T.A.Guliyev writes: "For this purpose, the most progressive system of organization of labor, normalization of labor and motivation of activity should be applied" (4 p. 103). Whether labor potential or human potential ultimately manifests and realizes in concrete labor activity. Labor potential reflects the equity of firms and the country's labor resources. Human resources are used to consider the employee's potential and personal qualities. It means that human resources should be adequate to human capacity in terms of its application. The concept of "labor potential" and "intellectual potential" in economic literature has become a subject of scientific debate.

A group of authors consider their labor potential as broader than their intellectual potential, and vice versa, to a greater extent than the potential for intellectual potential. "The difference between the labor potential and the intellectual potential needs to be approached from the point of view of the quality and improvement of the workforce, since there are no substantial differences between the labor potential and the intellectual potential in terms of traditional components." (4 p. 115). The effectiveness of the State Employment Policy affirms itself in creating the conditions for full and productive use of society's labor potential. Prof. M.Kh.Meybullayev wrote in his book *Theory of Economic Security*: "Employment policy should focus on the provision of full utilization of labor potential and the business activity of working-age population" (8th, 242). Investigations show that from the second half of the XXth century, the concept of labor potential has become more popular in economic literature. Labor potential gives an opportunity for complex and systematic review of the socio-economic, organizational, intellectual, psychophysiological capacity of the population, and quantitative and qualitative indicators of labor in that direction. Such approach to labor potential gives a chance to characterize a concept that reflects socio-economic relations at all stages of human labor. V.S.Bulanov writes: "... labor potential is a combination of both human and individual working capacities of various working groups in society as a whole. Unlike labor resources that determine the amount and structure of labor, the labor potential characterizes its quality and potential. Along with this, the quality side is in the unity with labor resources." (8th of 10th). Problems of labor potential, human potential and ultimately human capital formation and development are successfully being solved in our country. Thus, according to the calculations of the World Economic Forum for 2015, the "Human Capital Index" is ranked 63rd among 124 countries. Our country is ahead of such countries as China, Turkey and Indonesia. Our country was the 37th among 138 countries in the Global Report released by the World Economic Forum for 2016-2017. (2h7). For this purpose, special attention should be paid to the development of human potential, the quality of human capital and labor productivity. From the end of the 20th century, the concept of "human potential" is frequently used in economic literature. Professor S.M.Muradov writes: "At present, human potential is the main wealth and the main driving force of economic growth of society. Because the speed of scientific and technical progress depends on the organization and cultural level of the work, its productivity, first and foremost, the quantity and quality of human potential. It is no coincidence with that in many developed countries of the world the resources invested in human resources are more effective than other destinations (5 pp.206-207).

3. EFFECTIVE USE OF HUMAN POTENTIAL ON LABOR PRODUCTIVITY

Priority should be given to the development of competitive labor force, sustainable development of the economy of Azerbaijan, and the creation of areas that stimulate intensive labor in the short-term and short-term prospects for labor. In the medium and long term perspective, transition to a science intensive model should be ensured. Development of labor productivity and human potential is considered to be an important factor for two reasons. First, raising labor productivity in an intensive labor development model should be the driving force behind economic growth by creating a direct value in the country's economy. Secondly, it should be ensured that the development model, which requires more intensive knowledge, should only be achieved through raising labor productivity. All these ensure the competitiveness of Azerbaijani products in global markets, at the same time is more attractive to human capital investment. Over the past 15 years, Azerbaijan has undergone rapid growth and labor productivity has grown more than threefold. The labor productivity growth in Azerbaijan in 2000-2008 was 13.6 percent a year, but since 2008, labor productivity has continued to grow, but annual growth rates have dropped to about 2 percent on average. The "Strategic Road Map for the National Economy Perspectives of the Republic of Azerbaijan",

approved by the Decree of the President of the Republic of Azerbaijan dated December 6, 2016, has been defined as one of the priority areas for “stimulating the development of human capital to promote labor productivity”. Investigations and comparisons with regard to the level of development of countries in the region show that there are great opportunities for improving labor productivity in Azerbaijan. In eleven sectors covered by strategic roadmaps on national economy and key sectors of the economy, is intended to stimulate investment in human capital to increase labor productivity. “For this purpose it is important to establish and implement mechanisms to achieve training and regulatory change in near and far, increase the volume and efficiency of production, stimulate investment, and apply innovations to added value sectors and adapt them” (9h 91.). All projects that have already been launched in the Republic of Azerbaijan should be continued. Monitoring should also be conducted in order to follow the results of labor productivity dynamics. Grounding on the activity principles, the future development of the country should be based on new improvement plans. It is crucial to use cutting-edge and effective international practices in the preparation and implementation of measures to increase productivity. Workforce development and redesign process should always be continued to improve and develop human resources skills in production facilities. It is advisable to fund the training provided by the centers established for training employees who meet the labor market requirements in different directions. Increasing labor productivity and competitiveness in innovation activities in production and management areas is the main term for ensuring harmony in the development of human potential. The importance of this activity should be taken into account when preparing action plans and government programs that will stimulate the application of the innovation in our country. In order to stimulate innovation activities, the country has many opportunities to create a comprehensive network of knowledge through scientific research and innovations to award high-tech products and loans. Keeping these propositions in focus consistently and regularly are important for achieving optimal results. A comprehensive study of areas investigating along with measures for increasing productivity at separate levels, should be continued. The main goal here is to help them to establish effective relationships between responsible agencies, including state and regional organizations in each area, and to create mechanisms for increasing labor productivity. According to the concept of human capital, the main force in the development of modern society is the human. It means that human potential is a key factor in sustainable and stable development in the country, the competitiveness of the workforce, and ultimately, the improvement of the living standards of the population. Since human capital is creative, this theory is based on the “creative human” model and behavioral principle that is completely different from the traditional “classic” theory of the classical theory. The basis of this model lies in the realization of human creative capabilities and the development of personal qualities. This reflects the paradigm and principles of the creative economy. In this concept, a person's social role is determined by his personal qualities and abilities, not by the wealth he has accumulated. He is socialized and becomes a public figure. Labor potential, which combines the skills and capabilities of human beings with the ability to combine the profession and specialization of human beings from the birth, which is used in various spheres of public production, affecting the efficiency of labor productivity and production, increasing the wages of an individual and also increases the knowledge, habits, abilities, health, motivation and e.g. is a set of resources. Labor potential is a combination of many elements that embody it. It also has a certain structure. The followings should be included to the structural elements of labor potential: education and professional skills; health; intellectual level; mobility; natural, genetic abilities; the general-technical culture of the employee, etc. Education and health have the special place among these elements. Education as an element of human potential identifies the existence, being, ability to develop personality and resources of knowledge of human. Human health is essential for the development of his physical, mental abilities.

The employee's ability to work directly depends on his health in all directions, areas, goals and positions. Employees who have no sufficient health, poorly educated, low-educated or uneducated have a lower overall productivity than the employees who have good health and are less productive. Intellectual abilities include the solution of the problems that are characterized by the cognitive and successful performance of any activity. The existence of the knowledge and skills that the workers' labor activity is based on motivated, cultural, moral, psychological norms and values, the importance of fulfilling their professional duties, the corporate culture of enterprises and organizations, the labor remuneration and incentives combine the state policy in the direction of strong support of labor results. The role of internal and environmental factors in the implementation of the labor potential is also very high. Created suitable conditions for the realization of labor potential are one of the most important problems. In the realization of the labor potential, the person himself, his family, and then the company and organization he / she has worked for should ultimately be interested in the region or country where he lives. All this shows that in order to form and realize labor potential, people should be invested in micro, mezo and macro levels. Modernization of the education system in Azerbaijan is essential for the formation of a competitive economy. It has already been accepted that education is one of the main factors in the socio-economic development of the countries all over the world. The level of education is directly connected with the competitiveness. High quality materials are needed to produce high quality products in each socio-economic system. The education level creates labor potential, creates "Human capital", which combined with the "physical" capability, leads to increased productivity and quality improvement. Many well-known economists consider that the productivity of employees who have been educated and got knowledge in higher education institutions, is the most important factor of the competitive edge of the country's economy in the modern world. The main way of economic growth is to increase the development potential of the economy through improving the quality of human capital and management. In addition to the acceleration of both human and economic potential, the flexible and intensive development of the industry should always be focused on. Employees' health is as important as the educational system for the development of human capital in the formation of labor potential. So, if the health of the worker does not allow it, even though the knowledge level and the ability of a person is high, he couldn't be able to continue his labor activity. It means that the amount of funds allocated from the state budget to health financing is one of the most important indicators of the development level of the health system in any country. Labor Potential components form the creative energy of a person. Managing the creative energy of a person both for his own interests and for the sake of the interests of the community depends on the present circumstances. Everyone can be talented, competent, creative, but his creative energy, either positive or negative, directly depends on the specific environment of employee in which he operates, the incentives, and the existing opportunities given by the society. The first vocational, secondary, and higher education plays an exceptional role in shaping human potential, investing in human capital. Development of education all over the world has been recognized as the main locomotive for the socio-economic development of the countries, innovations and the technical and technological level of production. As a result of application of high technologies into production processes, productivity increases, products are more qualitative and cheaper. For understanding the importance and essence of productivity, let's pay attention to the Cobb-Douglas formula:

$$Y=A \times L^{\beta} \times K^{\alpha}, \text{ here}$$

A- Expresses the productivity,

K- Expresses the capital investment

L - Expresses the capabilities of the workforce.

The α and β expressions indicates the division between the investment used in production processes (k) and the workforce (L). Educated, literate, experienced and skilled labor resources and high-tech facilities are the key components of productivity. This proves that the basis of economic development, directly related to human capital and is the level of employees' education. President of the Republic of Azerbaijan, Mr. Ilham Aliyev, has approved the "Azerbaijan 2020: Look into the Future" Development Concept on December 29, 2012. Paragraph 7.2 of this Concept is called "Formation of the Modern Education System". Here, the government's activities have been reflected in the country's multidimensional development of the education sector. Targets covering all aspects of education are concentrated under the 26 headings 26 (1 pp.25-28). Human potential is essentially accomplished through entrepreneurial activity, which is a manifestation of economic relations in condition of market relations (7.p.6) Labor efficiency problem becomes even more urgent in condition of market relations. A number of antimarxist scientists, specialists, and political party leaders believe that labor productivity is merely a model of socialism and is connected with the system of socialism. In fact, the problem of labor productivity in industrialized countries is always in the spotlight. So, the State Programs on increasing labor productivity, firms related with management, industries and the country as a whole are being prepared in the USA, Germany, France, Japan, the UK and others. Edward Denison, a professor at the Brookings Institutions in the United States, has devoted much of his professional activity to research on the relationships between various factors of economic growth. E. Denison came to the most important conclusion that raising labor productivity is the most important factor in increasing national income. His research shows that 68% (about 2/3) of the US national income growth in the United States during the years 1929-1982 has been achieved through the increase in labor productivity (14. pp. 384). Brainstorming tactics, operational thoroughness and ideas in creating institutional mechanisms for raising labor productivity at national level, staff training, creation of centers, departments for labor productivity, compiling and implementing programs, economic incentives, taxes, credit income policies, and so on are related in the managing labor productivity in industrialized countries. The means directed to the development of human beings lead to an increase in its potential and ultimately the increase of labor productivity. As the productive power of labor grows, the ability of the employees for increasing labor productivity also increases. The productive labor force unlike the labor productivity is not the result, but it is the potential opportunity for achieving this or that result of labor in production process. One of the most important means of accelerating scientific and technological progress is the proper organization of material stimulation of employees working in this field. The rapid development of scientific and technical progress in the United States, the increase in its potential, is a continual increase in funding for this area and the financial status of its employees. The vast majority of American firms use flexible labor-intensive systems. The flexible system of labor compensation is based on the active involvement of employees in the creation and distribution of firms' revenues. In the United States, Various programs are used for ensuring employees' participation in the revenues of companies. These types of programs include the creation of a scholarship fund, salaries of managers and a single premium, based on the results of the year. The revenue sharing system is implemented through the concrete mechanism of motivation of employees. Razing labor productivity, is an increase in product quality, material savings, job reliability, customer satisfaction, etc. is taken as a basis here. Researches and advanced practices show that through the efficient use of flexible salary systems, firms' salaries can be increased substantially by increasing labor productivity, revenues. "The moral stimulation the labor of employees is ensured, particularly rationalized activity, shaping the company's permanent employees, reducing staff flow are solved here." (6th of 19th). Labor productivity in the flexible wage system depends on the effective organization of labor rather than the level of employees' qualifications.

The firms are constantly follow the dynamics of salaries of key categories of competitors who are competing with them, and determine the base level of their employees' wages. In this way, a competitive struggle for highly skilled workforce with high labor potential, high professionalism is carried out. The US payroll management system has a great role in stimulating employees' employment activity, who are working in the science field. In conclusion, increasing the STP's funding and stimulating employees who work in this area are one of the most important tools for increasing the scientific and technical potential of any country and to increase its effectiveness.

4. CONCLUSION

It is crucial to implement large-scale measures to ensure incessant development of human capital, increase labor productivity and the role of knowledge as a key components of the reforms, which have to be undertaken in the field of economic development. Problems such as stimulating investment in human potential development should be always at the center of attention to ensure the quality and productivity of all levels of education for the formation and development of human potential in this area. Labor potential, human potential and consequently the formation and development of human capital are being successfully solved in our country. For the two reasons, the development of human potential and increasing labor productivity in the provision of competitive, sustainable economic development of the Azerbaijani economy is considered as an important factor. Firstly, raising labor productivity in a labor-intensive development model should be the driving force behind economic growth by creating a direct added value in the country's economy. Secondly, the transition to a development model that requires a more intensive knowledge can only be achieved by raising labor productivity. All the projects envisaged in the Republic of Azerbaijan should be continued. It is crucial to use advanced and effective international experience in the preparation and implementation of measures to increase labor productivity.

MAIN ASPECTS OF IMPROVING THE FINANCIAL SUSTAINABILITY OF THE STATE AND THE USE OF INTERNATIONAL BORROWING IN THE REPUBLIC OF AZERBAIJAN

Damirov Yashar Rafael Oghlu

*PhD student and university lecturer at Azerbaijan State Economic Universit (UNEC)
yashardph@gmail.com*

ABSTRACT

The proposed article presents the economic nature and approaches to determining the financial sustainability of the state and government borrowing and the possibility of its formation. The article discusses the concept of "public debt", its structure by subjects of international credit and the foreign exchange composition of the country's foreign loans. It has been carried out the analysis of changes in economic development indicators and the indicators of the country's budget. It has been investigated the dynamics of changes in public debt and GDP in the Republic of Azerbaijan for the period 2010–2017. And also, the article examines the debt nature of the modern economy, as most countries lack their own resources to finance the current balance, to cover the state budget deficit, to carry out socio-economic reforms, and to fulfill debt obligations.

Keywords: *financial resources, economic reforms, public debt, external public debt, financial sustainability of states, solvency of the country*

1. INTRODUCTION

In international practice, external financial resources, as a rule, are used by the state as additional sources of development of the country's economy. In general terms, external debts or external indebtedness represent the sum of debts to non-residents in any currency, regardless of the place of receipt of foreign credit funds from abroad or in the country of the borrower. Over time, indebtedness goes beyond the capacity of the country, and this creates a need to reduce the expenditure side of the budget for investment and social purposes, as well as goals that are not related to the payment and servicing of public debt. The country's monetary, fiscal and debt policies interact very closely with each other: public debt has an impact on economic growth, cash flow, inflation, refinancing rate, unemployment rate, investment volume in the state economy as a whole and the real sector of the economy.

2. USE OF THE INTERNATIONAL LOANS AND MANAGEMENT OF PUBLIC DEBTS

The high growth of public debt entails a threat to the security of the country's economy and the stability of the budget system. The undocumented monetary, exchange rate and fiscal policy of the state causes concern in the financial market in relation to the investment climate, and encourages investors to put forward requirements to increase the risk premium. This mainly applies to countries that develop and form securities markets in which creditors have the right to refuse to accept long-term obligations, and this can adversely affect the formation of the financial market and economic growth [9]. At the same time, in developed countries debt and its provoked budget deficits are factors that are embedded in the economic cycle of economic development and its recovery. Money held by citizens, organizations, banks, as well as other financial and credit institutions have the asset status of these lenders. Public debt can be considered as a "loan to the nation itself" and it can be said that it does not affect the total size of the aggregated wealth of the population [5]. In General, public debt consists of:

- Domestic public debt: the debt from issued and outstanding domestic government loans;

- External public debt: the country's financial obligations to foreign creditors on a certain date;
- Gross domestic debt: this is the amount of outstanding, actual, current, non-contingent liabilities in the form of principal and interest received by a resident in relation to a non-resident, as well as obligations of residents of the country in relation to non-residents to be repaid at a certain time in the future.

In a broad sense, external public debt refers to the debt of the state on outstanding external loans and interest unpaid on them. External public debt consists of the state's debt to international and state banks, governments, private foreign banks. The current external public debt is the one for which the payment term comes in the current or the next budget year; capital debt is the one for which the payment term has not come yet [4]. Countries with low credit ratings are forced to provide extensive public guarantees to private domestic borrowers, thereby burdening the state budget in the event of their insolvency. The share of private non-publicly guaranteed debt in the external debt structure of such countries is relatively low. In developing and emerging markets, most external debt is public and publicly guaranteed; private sector debt to non-residents is predominant in developed countries. The main reasons for the emergence and increase of public debt are the following [6]:

- chronic state budget deficit;
- exceeding the growth rate of public spending over the growth rate of government revenue;
- fiscal policy aimed at reducing the tax burden without a corresponding reduction in government spending;
- expansion of expenditures and the economic function of the state;
- attraction of additional funds from non-residents in order to support stability of the national currency, etc.

At this time, the state economy faces two goals: to develop the financial market within the country and to direct funds to reduce the deficit in the country's consolidated budget. With a significant amount of public external debt, therefore, there is a reduction in the cost of development and expansion of production within the country, for social needs, in the end, everything affects the standard of living of people. Thus, the economic growth of the country is slowing down. The amount of public debt in the national part of the external debt also depends on the exchange rate. If the exchange rate has changed between the dates of determining the amount of debt, the revaluation of the amount of external debt denominated in foreign currency, is one of the factors of changes in the total value of public debt. This is especially important due to the fact that structurally the public debt consists of two parts: the main debt (capital) and the outstanding debt (current), which includes in addition to the main interest on debt amounts, or under the name of debt service. The state external debt of the country has both a positive impact on the national economy and a negative one. The positive consequences are as follows: 1) a great benefit for the country is that there is a possibility of attracting borrowed funds to the state budget and maintaining the relative size of the debt; 2) the budget deficit in the country leads to an increase in the volume of public debt, and the surplus, on the contrary, gives the opportunity to repay the overgrown debt [7.9]. Consequently, if a country is experiencing sustained economic growth, then the revenue side of the budget increases, which allows you to pay interest on the state debt. The negative consequences are as follows:

- with a constant increase in the external debt of the state, the government has to restrain investment in the national economy;
- the growth of foreign borrowing leads to a decrease in its political independence, and also entails a huge dependence of domestic finance on international one;
- public external debt, like any other debt, must be repaid together with interest.

In the process of organizing the state budget, public authorities need to take into account the optimal amount of the state external debt of the country. The budget legislation of the Republic of Azerbaijan defines the maximum amount of the state debt, as well as the debt obligations of the Republic of Azerbaijan to individuals and legal entities of the Republic of Azerbaijan, foreign states, international financial organizations. Public external debt includes foreign currency denominated debt:

- the amount of debt on state securities;
- the size of the principal debt of the loans received by the Republic of Azerbaijan;
- the value of obligations under state guarantees of the government of Azerbaijan.

We note that the state debt includes loans received under direct obligations of the state and attracted under state guarantees.

3. INDICATORS OF FINANCIAL SUSTAINABILITY OF STATES IN THE REPUBLIC OF AZERBAIJAN

The foreign debt of Azerbaijan under the signed loan agreements at the beginning of 2017 amounted to \$ 10 billion 931.8 million or 32.3% of GDP. Of this amount, 6.913 billion dollars or 20.4% of GDP was actually disbursed. And also in 2016 alone, Azerbaijan mastered loans worth \$ 1.204 billion (external debt grew by 46.1% over the year compared to 2015), and sent \$ 0.719 billion to payments on foreign debt (with figure 2015 year growth is 41.9%) [11, 12]. Foreign donors issuing loans to Azerbaijan are the following economic entities: the World Bank, the Asian development Bank, the Islamic development Bank, the European Bank for Reconstruction and Development, the Japanese Agency for International Cooperation, which have a share of 82.3% of the attracted public debt and the remaining subjects of 17.7% have attracted shares from the international capital market through the placement of long-term securities. According to the Ministry of Finance, as of April 1, 2016, the volume of the external public debt of the Republic of Azerbaijan amounted to 7,448.7 million dollars (11,486. 6 million manats), i.e. 21% of the country's GDP [13].

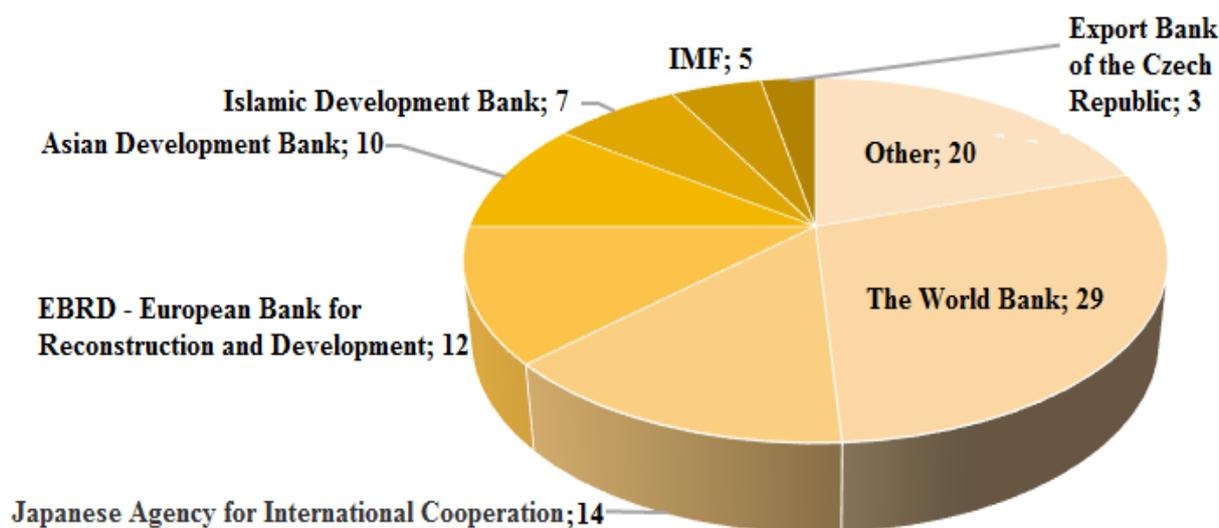

Figure 1: Structure of external debt by subjects of international credit, share by percentage.
<http://www.maliyye.gov.az/node/1939>

20 % of the signed loan agreements include the share of agreements from the Chinese government, loans from the Kuwait Fund, Royal Bank of Scotland, Import-Export Bank from the USA, etc. As of 01.04.2017, Azerbaijan has signed loan agreements worth \$ 14.2 billion

with international financial institutions and other credit institutions. At the same time, Azerbaijan's foreign debt on loans used on the basis of these agreements amounted to 9.6 billion dollars. The ratio of external debt to GDP was 22%, the volume of external debt per capita is 972.4 dollars [11, 12]. The currency composition of foreign loans of the state as of April 1, 2017 is distributed as follows:

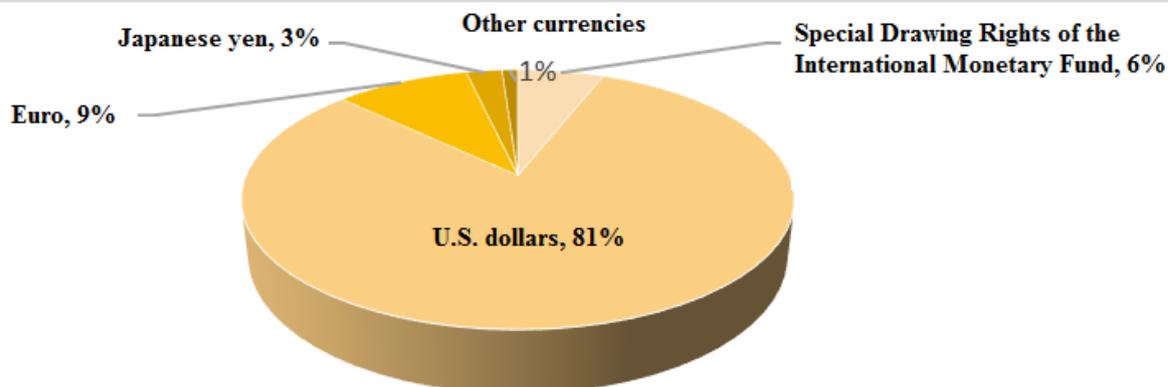

Figure 2: Currency composition of foreign loans of Azerbaijan.

At a fixed rate, it was raised 46.5% of the loan, at a floating rate - 53.5%. In the structure of external public debt, 43.9% accounted for loans for a period of 10 years, 52.3% - 10-20 years and 3.8% - more than 20 years. In the first quarter of this year, \$ 255.9 million was used under signed credit agreements. As of April 1, the country's internal debt amounted to 1.070 billion AZN. Note that 75% of the total amount of public external debt is debt on external bonds. It will be necessary to pay them until 2047, the highest payment is expected in the amount of US \$ 6,966 million in 2030. At the same time, as of January 1, 2018, the volume of external public debt of Azerbaijan amounted to 9398.9 million dollars (15978.1 million AZN), which is 22.8 percent of the country's GDP (we note that, in 2017, the country's GDP was 70135,1 million AZN). The borrowing statistics include direct liabilities of the state and contingent liabilities on loans attracted under a state guarantee. (Ministry of Finance). External public debt consists mainly of credit programs and infrastructure projects of international financial institutions, as well as securities placed on international financial markets. In drawing up the amount of government debt, the Ministry of Finance takes into account only those loans that have already been used at the time of the official report. In General, studying the volume of external debt of the state, it is possible to do several reasons for the sharp increase in the external debt of Azerbaijan. "In particular, within the framework of restructuring of external obligations of the International Bank of Azerbaijan, as well as obligations on large projects such as TANAP, TAP, Shah Deniz-2, the southern gas corridor, etc., it was signed large loan agreements. In the framework of these projects, Azerbaijan finances its share mainly through foreign loans. As part of the implementation of these major projects until 2020, the government will attract even more credits [14, 15]. As in other countries, debt management is already a problem of our country too. Here the main problematic issues are as follows: the first stage of the problem is related to the purposeful use of debts. As you know, the first condition for the successful implementation of the signed loan agreements is related to the use of costs for their intended purpose. But sometimes we see that these loans are spent on irrational directions and turn into corruption. That is, the use of such loans for projects that are not worth anything and the inflating of this loan portfolio from year to year is or becomes a serious problem in the management of public debt. The next problem is related to the distribution of external borrowings by sectors of the economy. There is considerable unevenness in debt diversification.

Most of the loans received are used for infrastructure projects (41.4%) and the energy sector (36.2%). This, after all, is causing delays in the development of the non-oil sector, which is one of the country's priorities. The share of public debt on foreign loans used relates to road infrastructure, industrial and energy sectors (Figure 3.).

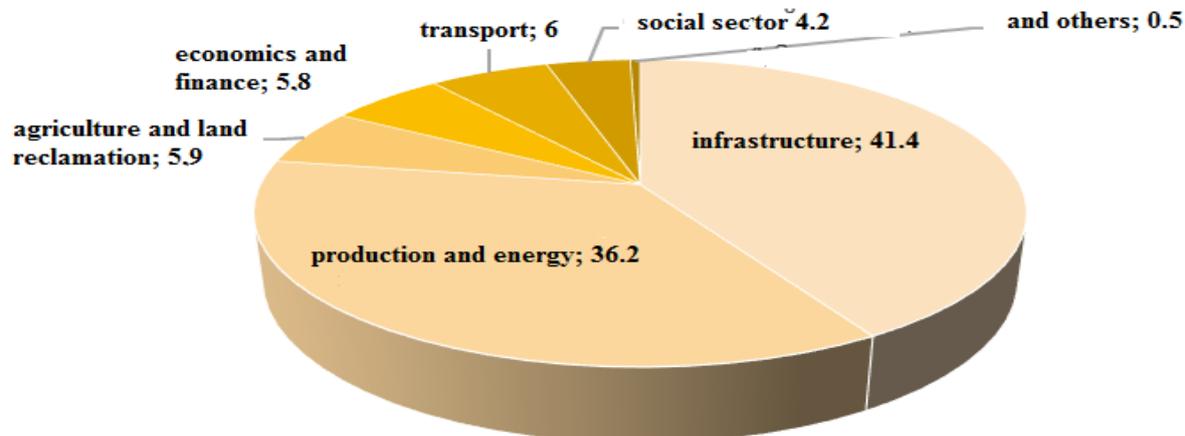

Figure 3: The structure of public debt by sectors of the economy, with percentage in 2016 (cbar.az).

For the analysis of financial indicators and to obtain the maximum possible effect from the attracted loans while minimizing the costs associated with them, as well, the severity of the debt burden of the country is determined by the following indicators [4,6]:

- ratio of total external debt to GDP as a percentage;
- ratio of total external debt to income from exports of goods and services as a percentage;
- ratio of payments on external debt service-to-GDP ratio as a percentage;
- ratio of payments on external state obligations to budget revenues in percent;
- ratio of external debt service payments to exports of goods and services in percent;
- the ratio of interest payments to GDP and exports of goods and services, official reserves to the total external debt as a percentage, etc.;

The debt dependence of a country can be measured by the level of severity of a country's debt load on liabilities to non-residents. The upper limit of the size of external debt, which theoretically allows it to be serviced promptly, is its ratio to GDP up to 40-60%, as well as to exports of goods and services - up to 200-250%; the ratio of debt service payments to the export of goods and services is up to 20-25%. In world practice, a country is considered insolvent if foreign debt exceeds 40% of GDP and 200% of exports [7]. The study of these indicators were put on the following table.

Table following on the next page

Indicators with percentages / years	Share of export in GDP	The proportion of imports in GDP	The share of foreign investment in GDP	Share of domestic investment in GDP	The ratio of external public debt to GDP	The ratio of external public debt to export	The ratio of external public debt to state budget revenues
2016	46,45	43,67	16,82	26,61	19,4	43,63	69,92
2015	29,81	15,61	22,0	18,1	12,4	14,8	36,18
2014	43,3	26,23	19,83	21,56	8,6	25,37	35,21
2013	48,4	26,26	18,12	22,65	8,2	16,87	24,38
2012	53	25,29	18,84	22,19	8,3	15,45	25,93
2010	54,3	20,68	19,42	17,66	7,42	13,42	27,15

Table 1: Indicators of public external debt of the country [13,15].

Studying in this table, we can draw the following conclusions that the share of public debt in recent years, starting in 2015, increases in the country's GDP. And if the share of public debt on the country's GDP in 2014-year is 8.6 %, then in 2018 this figure was already 22.8 %. In particular, all the studied indicators that determine the role of external public borrowing in the processes of economic development are increasing. These indicators indicate the obliging situation in the country, the first case is related to short-term insolvency of the country. The share of exports in the country's GDP was the worst in 2015 and amounted to 29.81%, since 2016, the increase in exports of goods and materials continues. The share of exports to the public debt was 25.3 % in 2014, 14.8% in 2015, and 43.63% in 2016 [16]; Studying the share of macroeconomic indicators of the Republic of Azerbaijan, we note that, starting from 2014, there has been a continuous increase in external public debt. The growth rate of debt in 2013, the country's foreign debt amounted to about \$ 6050.41 million, in 2014, 36% increase amounting to \$ 8257.74 million. In 2015-2016, due to servicing external debt, the state reduced its size down to \$ 6913.2 million. But the manat equivalent increased almost 2 times due to the devaluation of the exchange rate. We note that in 2013 \$ 1 was equal to 0.78 manat, and already starting from 2015, the rate of manat per dollar is 1.7 manat. The results of our research works indicate that if the government does not change the rate of growth of public debt, the economic crisis may worsen and then it may not be able to pay interest in the future and return loans that cannot be prolonged. This leads to the improvement of the public debt management system, which should be aimed at:

- optimization of public debt;
- strengthening of administrative control over the financial flows of the state;
- implementation of systemic institutional changes that create a favorable investment climate.

However, the use of these debt sources as a growth factor needs to take into account two important conditions:

- macroeconomic limitation of the level of external debt;
- improving the structure of external debt, i.e. the desire to increase the share of investment loans in the profitability of programs funded by them.

One of the steps taken to address the above mentioned issues is the establishment of a Financial Stability Council in the Republic of Azerbaijan as a governance mechanism. The Financial Stability Council should also ensure macroeconomic stability and financial viability of the financial, fiscal and monetary policies of a country that is responsible for a single platform. At present, due to the fact that the institutions that conduct macro and fiscal policy are included in the structure of the Cabinet of Ministers and on the other hand, the following structures not

being included in the structure of the Cabinet of Ministers, it necessitates even deeper coordination of fiscal and financial policy:

- Central Bank that is responsible for monetary policy;
- Financial Market Supervision Chamber as a megaregulator, and;
- State Oil Fund that has a leading role in the foreign exchange supply of the economy;

In this sense, the Financial Stability Council mobilizes all resources to determine the macro framework more precisely, as well as to create a basis for fiscal and financial policies to complete each other. In the world practice Financial Stability Councils were established in 2010 in the United States, in 2011 in Turkey, in 2012 in Sweden, in 2013 in Germany and Croatia. Analysis of world practice shows that co-ordination of agencies responsible for the different directions of economic policy gives positive effect. In Azerbaijan, the Financial Stability Council will play an important role in ensuring macroeconomic stability and financial sustainability in the country in line with the examples of successful foreign analogues.

4. CONCLUSION

Having analyzed the state of public debt, we came to the conclusion that the essential requirement for the payment of the non-payment policy is the export orientation of the economy and the implementation of the policy of free trade, while maintaining a surplus on the net international investment position is the main priorities of the state. When using the advanced payment system for long-term resource utilization, the most important factor is not to teach the essential requirements:

- macroeconomic limitation of external fluctuations;
- improving the structure of external debt, i.e. striving to increase the share of investment loans in the profitability of programs financed by them.

ABSTRACT

The purpose of this article is to analyze the financial stability of the banking sector of the group of countries and to build a risk map according to groups of countries based on basic indicators. The article presents the methodology of calculating the composite index BSFSI, which allows making a comparative assessment of financial stability of the banking sector of different countries. Using the Minmax method, the BSFSI sub-indices expressed in different units are comparable and can be used in comparative analysis. The article presents a review of the methods of assessing the liquidity of a commercial bank. As a result of the calculation, the estimation of financial stability of the banking sector of 29 countries on the basis of composite BSFSI index. The index BSFSI gives the ability in the most general form to assess the banking sector from the point of view of international competitiveness, and to compare it with other countries. On the other hand, this index allows identifying the strengths and weaknesses of the current financial condition of the banking sector at the level of individual countries and monitoring its sustainability. At the same time, the index does not allow us to judge the sources of risk if, for example, they are financial instruments. Thus, our index allows us to consider systemic risk as the probability of a serious downturn in the financial system. In this study, based on data on the basic indicators of the stability of the banking sector of 29 countries, we have calculated the BSFSI index, conducted the analysis for individual countries and groups of countries. In particular, on the basis of the BSFSI index, we constructed a map of risks for the financial stability of the banking sector in developed countries, the CEE and CIS countries, and countries with risky debt.

Keywords: *financial stability, banking sector, risk analysis, financial indicators, composite index, capital adequacy, earning capacity, liquidity, sensitivity to risk*

1. INTRODUCTION

In order to assess the current financial condition of the banking sector, to analyze its strengths and weaknesses, the international practice widely uses such indicators as the capital adequacy ratio, an indicator of the quality of assets, the level of profitability, liquidity and sensitivity to market risks. Assessment practice of these indicators is based on the standards of the CAMELS methodology, which is used in assessing the financial condition of commercial banks. Besides the well-known advantages, this technique has several distinct methodological disadvantages.

In particular, the result indicator of the bank reliability is a simple sum of scores of the reliability components, not taking into account the different degree of their influence on the overall assessment of the bank. In addition, evaluation of the quality of bank management used in the analysis at the micro level (for individual banks) are difficult to integrate to obtain the general assessment of the quality of management at the macro level (the whole banking sector) (Indicators, n.d.). In addition to the above key indicators, assessment of the financial condition of the banking sector in the international practice contains a set of auxiliary indicators. These indicators include: the geographic distribution of loans, the ratio of capital to assets, the ratio of large exposures (risks) to capital, relation of positions of total assets and liabilities on financial derivatives to capital, the ratio of trading income to total income and other indicators of this type (San Jose & Georgiou, 2008). To assess the financial condition of the banking system, the developed countries use main and slave indicators. On the contrary, the emerging market economies mainly use the set of basic indicators for the analysis and evaluation. On the one hand, this can be explained by the fact that the second group of countries falls behind the first in the complexity and depth of the financial system; on the other hand, this is due to the imperfection of the existing information base in emerging market economies. Thus, to assess the financial stability of the banking sector at the country level and conduct the comparative analysis of groups of countries according to this indicator, we need a more flexible method, which is presented in our work.

2. LITERATURE REVIEW

Assessment of financial stability of the banking sector based on different indicators has a fairly deep level of scientific study. The study of systemic risks in financial markets of different countries has increased after the mortgage crisis in the United States, which began in 2007, and after the start of the sovereign debt crisis in the Euro-zone. According to Grilli, Tedeschi, Gallegati (Grilli, Tedeschi, & Gallegati, 2014), the current economic system has placed considerable emphasis on transferring resources from the production segment to the financial sector, and therefore, ignoring the comprehensive assessment of the banking sector threatens with a more intense financial instability. Attempt to develop an assessment of financial stability of banking sector was made by Oort (Oort, 1990) in 1990. However, now it does not correspond to the new challenges and driving forces of the financial industry. Although, the study provided the basis for subsequent work. For example, a number of authors (De Nicolo & Kwast, 2002) have developed a model, according to which the continuing consolidation of the financial system increases the systemic risk. Some authors (Danielsson, James, Valenzuela, & Zer, 2016) in a series of their works showed that the risk indicators, that only take into account the specific risk of the institution, do not just help in monitoring systemic risk across the banking sector, but may exacerbate it. Another author (Lehar, 2005) also came to similar conclusions. Among the latest works, we can highlight the work of DeYoung (DeYoung & Torna, 2013), which shows that the policy of the Central Bank based on the wrong choice of indicators leads to increases in bank failures and growth of bank risks. There is a large amount of empirical literature, which considers financial stability focusing only on the quality of assets. Such works as Acharya (Acharya, Afonso, & Kovner, 2016) show why it is important to consider composite indexes for the financial sector, when banks start to compete with each other for liquidity after asset-backed commercial papers. The results convincingly point to the financing risk, which manifests itself as lack of foreign currency for banks engaged in liquidity transformation in foreign countries. For all this research area, there is a big methodological problem. These models do not explain the behavior of financial sectors with imperfect information base that we can observe in emerging market economies. At the same time, we can state that in our opinion each new work in this direction shows the same subject of study from different points of view.

Although the results stated in this literature are not final and cause a lot of controversy (Gong & Jones, 2013; Ioannidou, Ongena, & Peydró, 2015; Jones & Oshinsky, 2009; Ongena & Penas, 2009; Pais & Stork, 2011; Schaeck, Cihak, & Wolfe, 2009), our paper complements the works devoted to the evaluation of the financial market on the basis of composite index by the fact that our indicator correctly displays the rating both at the international level and at the level of individual countries. Thus, it eliminates the difficulties of scientific research of trends, associated with the fact that the same indicators in different countries in practice mean very different states of the market.

3. METHODOLOGY

The proposed index of financial stability of the banking sector BSFSI (Banking Sector Financial Stability Index) with certain modifications, is intended to be used both for the analysis and evaluation at the international level and at the level of individual country. This index can be calculated monthly, quarterly or annually. In our research, we used annual value of BSFSI. In the creation of the index, we used the following set of basic indicators of the financial condition of the banking sector:

- The sub-index of capital adequacy reflects the adequacy of the total capital. For its calculation, we used the eponymous indicator;
- The sub-index of asset quality expresses the quality of the loan portfolio, which constitutes the basis of the bank assets. For this purpose, we used the ratio of the share of non-performing loans in the loan portfolio;
- The sub-index of profitability assesses the level of general profitability of the banking sector. When evaluating on the basis of weight in the world economy, in index we used the averaged sector values of the margin on profit on assets and capital (ROA, ROE);
- Sub-index of liquidity maintenance characterizes the liquidity risks of the sector. When evaluating on the basis of weight in the world economy, we used the averaged sector values — the liquidity ratio (the ratio of liquid assets to total assets) and the ratio of instant liquidity (the ratio of liquid assets to short-term liabilities).
- The sub-index of sensitivity to risk reflects the sensitivity of the sector to foreign exchange risks. For the measurement, we used the indicator of open foreign currency positions.

In the construction of composite indicators, to convert variables expressed in different units to a common scale (measurer), we use a variety of methods. The most common of these are the standardization methods (z - skor), the Minimax method, method of separation from the compared country, the method of scale categories, the method of indicators above the average and below the average price, the method of cyclical indicators, balance reviews method (Freudenberg, 2003; Nardo, Saisana, Saltelli, & Tarantola, 2005). The use of any of these methods depends on the research objectives and properties of the used variables. Here, when the construction of BSFSI index, we used the Minimax normalization method. With the help of this method, variables expressed in different units are transformed to a comparable form and become suitable for comparative analysis. Normalization based on the Minimax method is carried out using the following formula:

$$I_c = \frac{X_c - \min(X)}{\max(X) - \min(X)} (I)$$

Here: I_c – normalized price X_c ;

X_c – price of the variable X in country C ;

$\min(X)$ – the minimum price of variable X in the analyzed countries;

$\max(X)$ – expresses the maximum price of a variable X in the analyzed countries.

From a theoretical point of view, capital adequacy, indicators of profitability and increase of liquidity ratios lead to higher financial stability of the banking sector, i.e. increasing the value of BSFSI. And increase of the share of non-performing loans in the loan portfolio and the deviation from zero in the open foreign exchange position indicates an increase in credit and currency risks in this sector. To consider these differences, we used a normalization of variables formula (2), inverse in the mathematical sense to the formula (1). It was used in the calculation of sub-indices of quality of assets and their sensitivity:

$$I'c = \frac{Xc - \max(X)}{\min(X) - \max(X)} \quad (2)$$

Here X_c , $\max(X)$, $\min(X)$ have similar values to variables in the formula (1).

Based on the assumption about the difference of impact force on the financial stability of the banking sector variables used to construct the sub-indices, BSFSI was calculated in two variants on the basis of equal and different weights of sub-indices;

$$BSFSI_1 = 0.2*CA + 0.2*AQ + 0.2*P + 0.2*L + 0.2*S \quad (3)$$

$$BSFSI_2 = 0.1*CA + 0.6*AQ + 0.2*P + 0.05*L + 0.05*S \quad (4)$$

Here, CA – the sub-index of capital adequacy;

AQ – the sub-index of the assets quality;

P – the sub-index of profitability;

L – the sub-index of liquidity;

S – the sub-index of sensitivity.

The value of BSFSI₁ calculated according to the formula (3) a priori estimates the equivalent contribution of each of the sub-indices in the overall assessment of the sector. A similar approach is used in CAMELS only at the micro level. International practice shows that efficient operation of the banking sector is possible only if the asset quality and profitability are high (that is, the non-performing loan ratio is low). In most cases, especially when the economy is facing a deep recession, stress in the banking sector is accompanied by, namely, a deterioration of asset quality, that in chain reaction leads to a decrease in profits, weakening of liquidity support and requires costs of capital reserves for compliance with obligations. This fact points to the inadequacy of the contribution of each of the sub-indices into the calculation of BSFSI, which is considered in the calculation of BSFSI₂ according to the formula (4). Instability in the banking sector may occur because of a "banking panic", "speculative flows", the sharp reduction of national currency. At the same time, the banking sector in the first place is facing a liquidity problem (although the sharp devaluation of the national currency directly influences the asset quality and their profitability), and its elimination will cost faster and easier than improving the quality of assets and increasing of profitability. The Central Bank has all the capabilities to provide commercial banks with liquidity assets. If necessary, it is possible to transfer liquidity assets to commercial banks and neutralize the stress of liquidity using such tools as the issuance of loans to banks using the channel of refinancing, operations with securities, foreign exchange intervention, svop-operations and changes in reserve requirements. Since the profitability indicator depends on the state of "saturation" of the economy, and is also closely related to non-performing loans, giving them both a high specific weight may lead to incorrect results. Therefore, the sub-index of the assets quality resulting from the main functions of the banking system (effective allocation of financial resources) should be different from other sub-indices by higher specific weight, which is reflected in the calculation of BSFSI₂. In total,

the analysis included 29 countries, including 19 countries of Central and Eastern Europe and the CIS, as well as 10 countries with the developed market economies. The information base of the assessment and evaluations is the database of the International Monetary Fund (International Financial Statistics/ Financial Soundness Indicators). The calculations were carried out on the basis of available materials over the last period of 17.11.2016.

4. THE RESULTS OF THE EVALUATION ON THE STABILITY OF THE BANKING SECTOR ACCORDING TO THE COMPOSITE INDEX BSFSI

This work brings additional knowledge and useful scientific conclusions about the problems of assessing financial stability. According to the results of the evaluation according to the index of financial stability of banking sector, at present, among the analyzed countries, countries such as Sweden (0,851), United Kingdom (0,792) and South Korea (0,775) have the most stable banking system. Norway and Georgia close the first five countries with the evaluation indices 0,764 and 0,736 respectively. (Table 1).

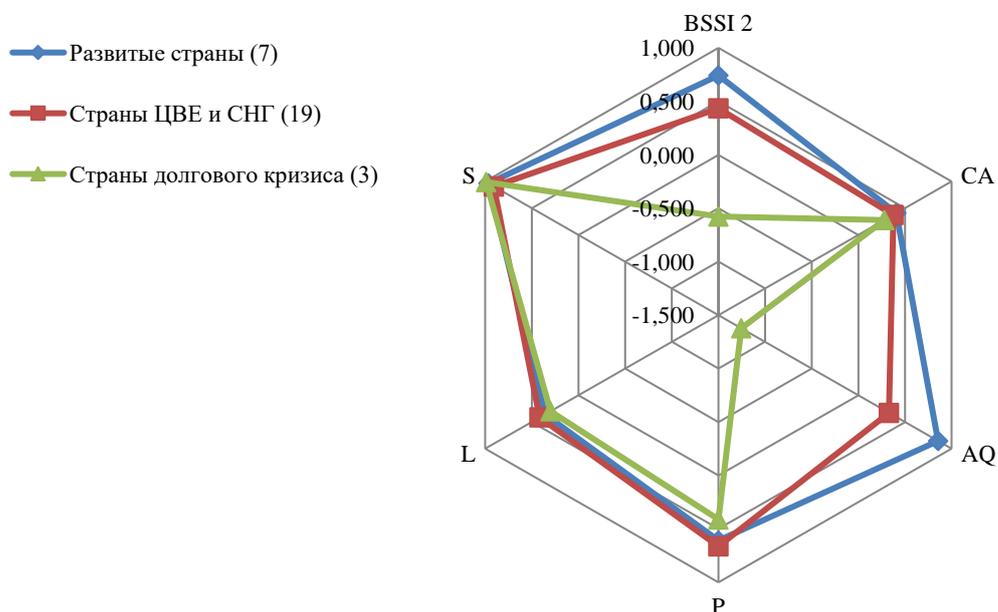

Table 1: The results of the evaluation of the index of financial stability of the banking sector in the CEE countries, CIS countries and some developed countries

Ranking according to BSFSI 2	Name of the country	Sub-indices					BSFSI 1	BSFSI 2
		CA	AQ	P	L	S		
1	Sweden	0.788	0.927	0.702	0.550	0.968	0.787	0.851
2	United Kingdom	0.442	0.930	0.671	0.187	0.931	0.632	0.792

Source: Compiled based on author's calculations

Cyprus, Greece, Ukraine and Italy have the worst indicators. Since 2010 they try to resolve the debt crisis, but failed to achieve this, and now they are in the ranks of outsiders. The countries of CEE and the CIS are mainly in the center. Kazakhstan's banking sector retains its stability at the present time, as it has better learned the lessons of the global financial crisis of 2008-2009, despite the negative shock from oil prices observed over the past two years. With the index of 0,558, Kazakhstan is slightly above average (0,404) level, in 14th place. The banking sector of Russia has an index rating 0,361 and is in the 22nd place, including the economy and financial sector, which suffered most from the negative shock in oil prices, where non-performing loans increased and profitability declined sharply. Overall, the considered countries can be relatively divided into 3 groups. Developed countries (7 countries), the countries of CEE and CIS (19 countries) and the countries of Europe, where the results of the debt crisis are most deeply manifested. Next, for each group, we showed the risk map of the financial stability of the banking sector (Figure 1).

Figure 1: Risk map of the financial stability of the banking sector according to groups of countries

Source: Compiled based on authors calculations.

Translation of elements: *Развитые страны* - Developed countries; *Страны ЦВЕ и СНГ* - CEE and CIS countries; *Страны долгового кризиса* - The countries of debt crisis.

As it can be seen from the risk map in Figure 1, the main difference between groups of countries is evident in the quality of bank assets as banking systems of developed countries has higher quality of loan portfolio. The results for the other risk factors are close to each other. The CEE and the CIS countries are even ahead of developed countries according to the results regarding the indicators of profitability and liquidity. This can be explained by characteristics of the market (in CEE and the CIS countries, the profit margins are higher) and the difference in approaches to the management of assets and liabilities.

5. DISCUSSION

In the last 10 years, the problem of assessing the stability of the banking system to risks was the center of attention of researchers and practitioners. However, literature about this and discussions about how to include risk in the evaluation system was quite rare. The authors of those empirical studies that examined the impact on the stability of the banking sector of certain

variables noted that the banking system of developed countries has higher quality of credit portfolio thanks to the work of the supervisors. In this regard, we also came to the same conclusion, as other authors (Acerbi & Scandolo §, 2008; Derviz & Podpiera, 2008). In the framework of this research, we did not record the effect of impact of increased capital on credit volume growth. So for comparison, Carlson (Carlson, Shan, & Warusawitharana, 2013) based on the annual data of Bank of the United States brought the dependency so that a 1-percentage point of capital increase, the credit increases by 0.05–0.2 percentage points. Such growth becomes particularly prominent during the crisis as banks are increasing their actual capital adequacy ratios by adjusting their portfolios in favor of less risky assets. Thus, our work confirms the results of other studies that also did not find this relationship (Gambacorta & Marques-Ibanez, 2011). Our work confirmed the thesis, according to which there are limits to the economic benefits from the creation of liquidity. We affirm the findings of Acharya and Naqvi (Acharya & Naqvi, 2012), who estimated that the excess liquidity may lead in the deeper crisis for banking sector. The resulting asset bubble potentially increases the vulnerability of the banking sector and increases the risks of generating financial crisis. On the basis of our index, we can't confirm those studies that try to explain the strong correlation between the ratio of debt to equity, creating liquidity and increasing risk. Thus, Berger and Bowman (Berger & Bouwman, 2009) believe that the accumulation of liquidity and the excessively risky behavior of banks may precede the financial crisis. There is a number of works that tried to find a link between the development of subprime mortgages and rising risks (Hellwig, 2009; Petersen, De Waal, Mukuddem-Petersen, & Mulaudzi, 2014), and that have come to controversial conclusions. Our results also indicate that the strategy of banks from the point of view of growth of credit and liquidity risks will differ in the extent of economic fluctuations. For example, as banks face greater liquidity risk, they create more risks during recessions than during economic expansions. In other words, our results show that liquidity risk is more important than credit risk in a downturn than during a boom. This conclusion is consistent with the recent policy of the Central Bank of different countries, where regulators have been more focused on liquidity management in the banking sector. Especially after December 2010, when the macroprudential policy of the Central Bank was aimed at reducing risks in the financial system by adjusting the reserve requirements. Our index confirms the findings of some works (Fiordelisi & Mare, 2014; Vallascas & Keasey, 2012) about the importance of the regulatory framework for the functioning of a stable system. Restrictions on attraction of borrowed proceeds and strict requirements for liquidity can improve the resilience of financial institutions to system events. The size of the bank may be an effective tool for risk reduction, according to these authors. Our index also allows us to conclude that increased competition stimulates banks to diversify risks, indirectly making the system less vulnerable to shocks, but only in cases where an institutional system is strong. Otherwise, we can establish that financial liberalization increases bank risk. This is also confirmed by several studies (Cubillas & González, 2014).

6. CONCLUSIONS

To assess the financial stability of the banking sector, we used a variety of metrics. From the point of view of possible applications, combining them into a single composite indicator is of particular importance. Our proposed Banking Sector Financial Stability Index (BSFSI) is intended both for comparative international assessment of financial stability of the banking sector and for its evaluation in the country. On the one hand, the index BSFSI gives the ability in the most general form to assess the banking sector from the point of view of international competitiveness, and to compare it with other countries. On the other hand, this index allows identifying the strengths and weaknesses of the current financial condition of the banking sector at the level of individual countries and monitoring its sustainability. At the same time, the index does not allow us to judge the sources of risk if, for example, they are financial instruments.

Thus, our index allows us to consider systemic risk as the probability of a serious downturn in the financial system. In this study, based on data on the basic indicators of the stability of the banking sector of 29 countries, we have calculated the BSFSI index, conducted the analysis for individual countries and groups of countries. In particular, on the basis of the BSFSI index, we constructed a map of risks for the financial stability of the banking sector in developed countries, the CEE and CIS countries, and countries with risky debt.

ABSTRACT

Building a successful innovation ecosystem is a key factor in innovation, growth, and development. Formation of a favorable innovation ecosystem remains an essential policy priority for the government of Azerbaijan too. President of the Republic of Azerbaijan signed a decree on the establishment of the Innovation Agency under the Ministry of Transport, Communications and High Technologies of the Republic of Azerbaijan on November 6th, 2018. The Innovation Agency to be established in 2019 will be a coordinating body to draft and implement an innovation roadmap of an Azerbaijani ecosystem. This paper reviews world practice, including an Israeli practice of success to deduct results and models to build an ecosystem in Azerbaijan. The aim is to determine factors that made the Israeli ecosystem successful and study if these factors can be applied to the development and implementation of similar benchmarks in Azerbaijan. The methodology that is used for this research is the case study from Israel. Through systematic analysis and logical generalization, the paper analytically discusses and deducts conclusions from Israel's experience to spell out some key public policy lessons. While the paper finds out that the R&D grants, venture capital policies, developing skilled human capital and public-private partnerships were the reasons of the success of Israel, this paper also determines that government played a key role in stimulating these policies with successful outcomes in successful practice. The limitation of the research with the case is the generalizability of the case study. The practice of Israel does not mean that the similar practice will be successful in Azerbaijan.

Keywords: *Business Model, Ecosystem, Innovation*

1. INTRODUCTION

Innovation has become an essential concept in the economic growth related to the rapid development of Information Communication Technologies (Mercan and Göktaş, 2011, p. 1), and building a successful innovation ecosystem is an essential factor in the growth and global development. Scholars in economics study what the prerequisites are contributing to the construction of a sound innovation ecosystem. At the same time, the establishment of a favourable innovation ecosystem remains an essential policy priority for the government of Azerbaijan as a part of a global trend and requirement of a modern economic system. President of the Republic of Azerbaijan signed a decree on the establishment of the Innovation Agency under the Ministry of Transport, Communications and High Technologies of the Republic of Azerbaijan on November 6th 2018. The Innovation Agency to be established in 2019 will be a coordinating body to draft and realize an innovation roadmap of a country's ecosystem.

Considering the above-mentioned issues, studying the world practice in the case of Israel is imperative from an academic point of view to define policy lessons for thriving innovation policy and investigate the possibility of implementation of related benchmarks in Azerbaijan.

After the establishment of the State of Israel in 1948, it was remaining an underdeveloped and rural country negatively affected by the war. However, Israel could successfully make a huge transformation into a global innovation powerhouse with multibillion innovation companies (David, 2016, p. 26). Haan and Golany (2011, p.130) determine Israel as a nation of innovation and entrepreneurship. In spite of its remote location, today Israel is a leader of medical, automotive technology and FinTech (World Finance, 2018). Encouraged by Intel's entrance into the Israeli market in 1974, hundreds of multinational corporations started investing in the high-tech sector in Israel (World Finance, 2018). Israel's innovation ecosystem can be mentioned as a good sample of success. As of September, 2nd2018, multinational companies run 344 R&D centres in Israel (Haaretz, 2018). The companies that opened R&D centres in Israel include Facebook, General Electric (GE), Barclays, Google, IBM, PayPal, Dropbox, Huawei (Nocamels, 2018). Based on an available data, more than 20 billion dollars were spent for acquiring Israeli companies by multinational giants such as Facebook, Grubhub and Salesforce in 2018, while accurate numbers must be larger (Feller, 2018). Venture funds such as Sequoia Capital, Greylock, and Nokia Ventures have a strong presence in Israel (Kalish & Avni, 2016). The above-mentioned accomplishments, as well as the inflow of international venture firms into Israel, have been possible due to the uniqueness of innovation ecosystem in Israel. Lacked an abundance of natural resources, the priority of Israeli government was to innovate an economy since its early days. This paper will show that the government of Israel did not only pursue an active policy in terms of distributing R&D grants and funding for venture firms, but also stimulated the emergence of start-ups, public-private partnerships, and provided skilled human capital with right resources in order to create a strong innovation ecosystem.

2. THE CONCEPT OF INNOVATION ECOSYSTEM

Before we started to find out policy lessons for building an innovation ecosystem in Azerbaijan on the basis of the study of Israeli practice, this concept must be clarified.

2.1. What is Innovation?

Avidor writes that 'innovation is the conception, design, and implementation of new products and processes or changes to existing products and processes that create value for society' (Getz and Segal, 2008; referenced by Avidor, 2011, p. 4). Avidor mentions two forms of innovation. The first type of innovation which he calls 'high-order innovations' include the creation of new and disruptive technologies/solutions. The second type of innovation which he describes as 'low-order innovations' include small applications to enhance the efficiency of the existed technologies/processes (2011, p.4). Historically speaking, regardless of their low and high order, innovations have always served to the consolidation of economic efficiency and bolstered economic & societal development. Today's the most fortunate companies including Apple, Google, Alibaba, Microsoft, Facebook, IBM, Samsung, Toyota, SpaceX, and Amazon have reached a pinnacle of success thanks to their innovative products. Wealth creation has always been related to innovation (Jackson, 2015, p.1).

2.2. What is an Innovation Ecosystem?

'The term innovation ecosystem refers to a dynamic, interactive network that breeds innovation'(Oksanen, Hautamäki, 2014, p. 4). A widely believed agreement is that the main parties of innovation ecosystem include academic institutions, government agencies, policy-makers, research centers, venture funds, large companies and start-ups (Oksanen, Hautamäki, 2014, p. 4-5).

Briefly speaking, the development of an innovation ecosystem depends on the availability of skilled labor, research institutions, funding as well as the availability of private or government-sponsored infrastructure. Silicon Valley is a well-known example of an innovation ecosystem. India and Israel can also be mentioned as good examples of innovation ecosystems too. 'An innovation ecosystem is said to be thriving and healthy when the resources invested in the research economy (either through private, government or direct business investment) are subsequently replenished by innovation induced profit increases in the commercial economy' (Jackson, 2015, p.4). A strong ecosystem requires cooperation among individual investors, government agencies, and research centers (Wessner, 2004, p.1).

2.3. What are criteria of a sound Innovation Ecosystem?

Avidor elaborated its four-factor framework which highlights the importance of four criteria for a sound ecosystem which includes the availability of financial capital and skilled human resources, economic incentives, access to information (2011, p. 4). Despite the fact that the importance of these factors must be recognized, the role of government is unavoidable for consolidating an innovation ecosystem. Meanwhile, the government can not only play a crucial role in facilitating collaboration but also can support programs to create incentives for private investors to invest in innovative products/solutions. Investing in innovative products is deemed to be risky for private investors, as there is not an uncertain probability of success.

3. THE CASE OF ISRAEL: POLICY LESSONS FOR AZERBAIJAN

As mentioned earlier, Israel is one of the most developed countries which possess a well-functioning innovation economy. Multinational companies and international venture funds have actively participated in investing in Israeli technology companies and start-ups. It was Israeli governments' programs that made an effective innovation ecosystem. Therefore, it is a good case for an empiric study to understand the role of government in innovation policy. In 1948, when the State of Israel was established, it was a poor and agricultural country. Its economy was weakened by the war, and it had a little prospect of development. The country had scarce natural resources. Therefore, the government of Israel aspired to establish a robust innovation economy from the first days of its foundation (Claros, Mia, 2006, p.89). Claros and Mia (2006, p.89) write that 'recent Israeli economic history is an excellent showcase of the key contribution efficient government intervention can make to the overall innovation potential and ICT readiness of a nation'. As illustrated in the four-factor framework of Avidor and in the earlier theoretical studies, a number of primary factors are prerequisites to building a sustainable innovation ecosystem (2011, p. 4). These elements include the availability of financial capital, human resources, economic incentives, information access, as well as the collaboration and interaction between government, the private sector, educational & research centers and individual entrepreneurs who are aspired to produce innovative products/ solutions (Avidor, 2011, p.4).

3.1. Venture capital, public-private partnership & infrastructure, and human capital support policies in Israel

Avidor (21, p.21) mentions that 'Israel's policy planning, responses to market developments, and luck led to the creation of proper economic incentives, fluid access to financial capital, skilled human capital and robust connections to global information networks for the emergence of an innovation economy'. The most important factor for an innovation ecosystem is the availability of adequate financial capital. 'Innovation typically requires investment capital to pay for labor, office/lab space and/or materials. High-order R&D investments tend to require large up-front, uncollateralized cash and only offer varying probabilities of success' (Avidor, 2011, p. 6).

The requirement of uncollateralized cash and uncertain probabilities of success makes innovation project riskier for individual investors. Thus, a developed venture fund industry is crucial to financing inventions and technological creativity (Claros, Mia, 2006, p.99). 'Venture capital (VC) firms are specialized financial intermediaries formed to invest in startup firms on behalf of a pool of investors' (Avidor, 2011, p.9). Especially, the involvement of international venture funds is useful in countries with limited financial capital. Israel has also lacked VC funds in the early 1990s since the country had 2 VC funds (Avnimelech, 2009, p.12). The creation of the VC fund industry was a crucial priority to provide funding for innovative programs. Therefore, the most successful program of the Israeli government for nurturing VC fund industry, involving international capital as well as providing cooperation between private and government sectors was 'Yozma'. The program was launched in 1992 with the goal of creating a competitive VC industry and involving international VC funds in Israel (Avnimelech, 2009, p.4). Eventually, a 100M\$ state-owned VC fund was founded with the first objective of investing in 10 private funds (80M\$) and with the second objective of making direct investments in high tech companies in Israel (Avnimelech, 2009, p.5). The main regulation to invest in VC funds was that Yozma fund would invest 40% in a newly established VC fund by stipulating that a fund has to be an independent Israeli fund, has to raise the rest of finance (60%) by establishing limited partnership with an international venture fund while most investment decisions have to be made by international investors (Baygan, 2003, p. 16). Eventually, the program 'Yozma' did not only become a cornerstone program in building VC industry in Israel but also it provided early-stage funding for Israel companies to develop their products (Yin, 2017). In the 1990s, the venture capital investments increased from \$58 million by \$3.3 billion thereby making Israel second in the private equity market after the US (Yin, 2017). Between 1990 and 2008, there was a dramatic increase in the number of active VC funds in Israel. The number of venture funds increased from 2 to 68. Furthermore, Yozma promoted the cooperation between professional American VC funds and local Israeli funds as well as private and government sector. As a result of the involvement of international funding in locally established VC funds, Yozma funds increased by 250 million US dollars (Baygan, 2003, p. 16). As the availability of financial capital was one of the key factors for a sound innovation ecosystem, the Israel government did not only play an important role for providing funding for Israeli startups but also stimulated the creation of VC funds industry and the entrance of international VC funds into Israeli market under the Yozma program. Yozma program is considered an important program in VC fund policy. 'Inbal' was another program of Israel government for involving international investment in the innovation industry. The program which started in 1991 offered 70% equity guarantee for international VC funds which want to invest in Israeli start-ups (Baygan, 2003, p. 16). Although Inbal is not considered as successful as Yozma, it is important to note that the program can be characterized by its uniqueness for both attracting international VC funds by minimizing their risks. The program can offer incentives for global VC funds to invest in Israel start-ups. The third promising initiative that was designed to fill the funding gap for early innovation projects was the Technological Incubators Program of the Israeli Innovation Authority which was established in 1991. The Technological Incubators Program established 24 incubation centers (Yin, 2017). The program offered \$500,000 to \$800,000 for funding and incubating early-stage ideas for the period of two years (Yin, 2017). Incubators are hubs with the appropriate human and material resources which carried 1300 projects between 1991 and 2008 while involving additional private investment up to 3 billion US dollars (Avidor, 2011, p. 28). By initiating the Technological Incubators Program, the Israeli Innovation Authority did not only offer to fund for early-stage ideas that can be found risky by private investors but also established an extensive network of technology hubs to generate viable projects. In addition to the above-mentioned programs, the government of Israel offers R&D grants, especially to those products and solutions that are related to

innovation. Thus, the Office of the Chief Scientist was established in 1969 to encourage research and development in industrial innovation, and it distributed R&D grants (with an annual budget of \$500 million) between 1988 and 2000 (Avidor, 2011, p. 25). Israeli government's programs including Yozma, Inbal and the Technological Incubators Programs provided seed funding and R&D grant for early-stage ideas. The availability of financial capital is an essential component of a sound innovation ecosystem, and the programs of Israel created the emergence of VC industry and grants for funding early-stage ideas. As mentioned earlier, interaction and cooperation between private sectors, government, and individual investors are another essential component of a sound innovation ecosystem. It is important to mention that Yozma, the Technological Incubators program and Inbal promoted the cooperation and interaction between the parties of innovation. Another interesting program of the Israeli government was Magnet which started in 1993. Under this program, multi-year R&D grants were offered for an academic institution to cooperate with an industrial firm to produce innovative technologies/solutions, while the program provided 66% of the total R&D budget (Claros, Mia, 2006, 98). The program played an important role in facilitating cooperation between the academic and industrial sector and initiated the establishment of 31 consortia by 2005 (Claros, Mia, 2006, 98). The program can also be unique to facilitate interaction, inter-linkages, and cooperation between industry and university sector, and it creates incentives for a business sector to cooperate with universities and research centers. Uniqueness and effectiveness of Israeli government's programs is that the government took the responsibility of risky funding for technological start-ups, creative ideas and venture funds, while it offered economic incentives and infrastructure support (R&D grants, venture capital funding, early-stage investment in start-ups) for various sectors (venture funds, educational institutions, international venture funds, start-ups) to cooperate and interact with each other. While analyzing all programs, almost all of them intended not only funding but also promoting strong cooperation. The availability of funding stimulated the emergence of new start-ups, while venture policies fostered the dramatic increase in the number of venture funds. Development of human resource is another criterion for an effective innovation economy. Since Israel lacks natural resources, the governments another priority was to develop human capital through building a quality education system. Skilled engineers, scientists, and inventors can contribute to research and innovative product development. When the state of Israel was founded in 1948, another priority of the government was to enhance the quality of education and academic excellence with the special focus on preparation and training of world-class engineers, scientists and industrial managers (Claros, Mia, 2006, p. 91). In the early 1970s, a number of universities in Israel were offering world-class research and education including Ben Gurion University in Beer Sheba, the Technion in Haifa, the Weizman Institute in Rehovot, Hebrew University in Jerusalem, and the Universities of Haifa and Tel Aviv (Claros, Mia, 2006, p. 91). In the early 2000s, the Israeli workforce was one of the most educated in the world having world-class specialists in agriculture, engineering and natural sciences (Avidor, 2011, p.43). Finally, the activity of Innovation Authority of Israel is interesting to study from the perspective of international cooperation. Along with distributing R&D grants, the authority conducts its operation in Europe, Americas, Africa, and Pacific to find global opportunities for Israeli companies and cooperate with multinational corporations for joint projects (Innovation Israel, 2018).

3.2. Policy Lessons for Azerbaijan

A number of policy lessons can be deduced from the case of Israel to build an innovation ecosystem in Azerbaijan. First of all, the role of government is inevitable in innovation management and funding. Second, the Israeli case shows that the development of the innovation economy requires a huge financial investment.

Since these kinds of investments are risky for private companies, the government is supposed to both provide incentives and sponsorship in the sector innovation. Programs Yozma and Inbal can be mentioned as successful examples.

3.3. Development of VC fund industry

As the Israeli case shows the availability of capital and development of the VC industry is a key area in the development of the innovation ecosystem. Under programs of Yozma and Inbal, the government of Israel did not only encourage the development of VC fund industry but also created incentives for foreign venture funds to enter Israel. This can be a good public policy lesson for Azerbaijan as the government of Azerbaijan should consider in both enacting laws on the management of VC industry as well as providing financial support for venture funds under its Innovation Agency. As Azerbaijan is a small country, it lacks financial capital. There is a need for contributions from international venture funds. The government venture fund can be established and should offer incentives for foreign venture funds. Involvement of foreign venture funds in Azerbaijani is also good practice from the perspective that the country lacks the professional expertise in terms of making investment decisions. Development of VC fund industry should be a priority in the innovation roadmap of Azerbaijan.

3.4. Provision of the collaboration between academia, industry, and government

The second policy lesson for Azerbaijan is that interaction and cooperation between the government and industrial sectors as well as education/research institutions are very important. There is not a culture of cooperation between the industrial sector and education/research institutions in Azerbaijan partially because it was a part of former the Soviet Union. As Israel's experience shows, the Magnet program incentivized the development of cooperation between industrial and academic sector by providing grants to develop innovative products. It is necessary to develop a similar grant scheme under the Innovation Agency in Azerbaijan to offer grants in reasonable amounts to facilitate the cooperation between industry and research. It will definitely increase interests of academic and industrial sectors to apply for grants. There are many academicians and researchers in Azerbaijan who have theoretical inventions, but they really need funding for development, testing, and commercialization. Cooperation with the industrial sector for commercial feasibility is a must. The design and implementation of similar grant schemes will definitely contribute to the development of interaction between various sectors and offer further incentives for the cooperation.

3.5. Funding support, infrastructure, and resource provision

Another lesson from Israel can be deduced from Technological Incubators Programs which supported the development and realization of proper funding, incubation and infrastructure support. Surely, development a favorable infrastructure and technological incubators with the right resources and available funding should be considered as a good benchmark for Azerbaijan too. Establishment of incubation centers, hubs and provide the incubation programs with the right resources and labs should also be considered for Azerbaijan. As Yozma experience shows that state-funding scheme should be created for start-up companies. Having a government funding scheme and resources will definitely stimulate the emergence and the growth of Azerbaijani start-ups. A good lesson is that the formation of proper innovation infrastructure and its maintenance should be a government task. Investment in start-ups can be riskier from cultural and business points of view. The government can establish a program to provide equity guarantees for private investors too.

3.6. Development of human capital

Israeli experience shows that the availability of human capital is also important for an innovation ecosystem. The government should cooperate with universities to build the capacity of departments that provide technical education programs while specialized training courses are for managers and engineers. Study tours, international training courses and increasing the capacity of key participants of the innovation ecosystem should be useful from this point of view. Meanwhile, funding schemes and R&D grants can be provided with Technological Incubators Program or under the program like Magnet which offers to fund but also stimulates a business sector and universities to cooperate on the development of certain innovation programs.

3.7. International collaborations

Final policy lesson for Azerbaijan is that international cooperation should be maintained as a priority. Economic, tax and other types of incentives should be created to involve R&D centers of foreign companies in Azerbaijan as well as provide the involvement of foreign venture funds. Israeli experience shows that the government played a key role in almost all levels of development of the innovation ecosystem in Israel. The role of government should also be organized in a way that it can find our global opportunities of cooperation for companies. At the same time, the government should provide the companies with resources to get access to international sources of finance and collaboration.

4. CONCLUSION

This paper reviewed and deducted policy lessons for Azerbaijan by analyzing and discussing the policies and programs in Israel for building innovation ecosystem. The main finding of this paper is that the government has a vital role in building the innovation ecosystem, as the Israeli case showed. The paper deducted that several factors and policies of Israeli government made it one of the best innovation ecosystems in the world, including VC fund policies, R&D grants, facilitating public-private partnership support as well as sponsorship support for start-ups. Based on Israel experience, the paper determined several key policy lessons for Azerbaijan which include the development of VC fund industry, provision of cooperation between academia, industry, and government, start-up funding, infrastructure support, human capital development and international cooperation. The paper also determined that a successful innovation economy depends on the formation of a successful innovation ecosystem. Innovation ecosystem is successful when there is cooperation between various sectors and developed VC fund industry. The successful government programs can support developed venture capital industry, facilitate the cooperation, develop infrastructure and create incentives for international cooperation. The main directions for Innovation Agencies were determined which include:

1. Active participation in the development of VC fund industry;
2. Provision of incentives for the cooperation between industrial sector and research institutions;
3. Fostering the commercial and R&D cooperation between start-ups, multinational companies, and government agencies;
4. Rendering investment grants to start-ups;
5. Development of innovation infrastructure, hubs and technological/business incubators;
6. Supporting and facilitating international cooperation and linkages.

ABSTRACT

At present, it is crucial for companies to remain in the global market and to become more competitive in their position through the implementation of innovation policy. Major innovations are the product innovations where significant improvements can be reflected in technical specifications and new materials, that are significantly different from the original products, thus replacing the products and materials that are absent for the needs of different sectors of industry. Replacement of existing materials in the production of final products by new, forward-looking materials contribute to preserving and increasing market. Solving this relatively complex problem is to focus attention to the manufacturing process that delivers prospective products from new materials with minimal adaptation of technological processes and repeatable economically efficient and environmentally friendly production. At present, the field of manufacturing of special composite materials is considered to be key in the view of new, safer, technically more environmentally friendly and economically more efficient applications for various industries. New trends in fibers development are going towards widening the range of fibers from the classic types of fiber-forming polymers. Polymer blends where a large number of mixtures with a wide range of performance can be prepared from a limited number of ingredients are becoming more important. In our research based on the study of the structural characteristics of polymer mixtures and the determination of the optimal technological conditions of the manufacturing process we have experimentally prepared new types of special composites, which are applicable as materials for collection of hazardous compounds in air protection sector as effective filters.

Keywords: *Effective manufacturing processes, Product innovation, Special polymer composites*

1. INTRODUCTION

Major innovations are the product innovations where significant improvements can be reflected in technical specifications and new materials, that are significantly different from the original products, thus replacing the products and materials that are absent for the needs of different sectors of industry. Extending the range of existing materials or replacing them with new, innovative materials for different sectors of the industry is currently an extremely up-to-date direction for product innovation (Linderman et al., 2013; Ružinská, 2017). At present, the field of manufacturing of special composite materials is considered to be key in the view of new, safer, technically more environmentally friendly and economically more efficient applications for various industries (especially engineering, construction, automotive, chemical, rubber and textile). New types of materials for preparing composite materials with a wide range of functional properties and higher added value are currently being preferred, prepared by modifying and optimizing the manufacturing process from an existing assortment of fiber-forming polymers for automotive, civil engineering, woodworking, chemical and other sectors of industries (Bhattacharyya et al., 2009; Lindermann, 2013; Alexandrescu et al., 2017; Ružinská et al. 2014, 2018). Predictions in the development of chemical fibers in the world point to a further increase in the proportion of fibers with specific characteristics such as ultra-fine fibers, particularly beneficial for use in composite materials.

New trends in fibers development are going towards widening the range of fibers from the classic types of fiber-forming polymers. In fibers industry now increasing attention is paid to the polymeric system type "polymer-polymer", usable in composite materials. Polymer blends where a large number of mixtures with a wide range of performance can be prepared from a limited number of ingredients are becoming more important (Han, 2007; Alexandrescu et al., 2017). Preparation and diversifying fibers may also be based on intentional physical modification of polymeric systems in the preparation of fibers. Particular attention will be paid to the preparation of fiber-based bicomponent and composite systems. This type of modification is possible to prepare fibers with improved functional characteristics (Ružinská, 2014). Practically the most important method of preparing polymer mixtures is mixing the components in the melt. If mixing lasts long enough, and the system does not take chemical reactions a dynamic equilibrium between breakup and coalescence of particles is created in the mixture (Cool et al., 2005; Gold et al., 2017). Polymeric blends form a group of polymeric materials, the relevance of which is recently growing. This is due to the fact that it is possible to produce a large number of mixtures with a wide range of performance from limited number of components. Polymers suitable for the preparation of fiber-forming mixtures are mostly thermodynamically intolerant ones, which prevents the formation of a homogeneous system (Staropoli et al., 2017). Thermodynamic compatibility is the ability of polymers to create a homogeneous, single-phase, thermodynamically stable system (Van Hemelrick et al., 2004). In terms of intermolecular action we distinguish incompatible or pseudo compatible polymer blends, to which the abovementioned condition does not apply. The compatibility of components of the mixtures is the result of interactions between the same (cohesion), respectively different components (adhesion). Compatibility is usually manifested in polymers of similar chemical composition. Fiber-forming polymers (PP, PA₆, polyester, polyolefins) belong to groups of thermodynamically immiscible (intolerant) polymers. The outcome of polymer intolerance is the formation of the boundary as a result of the increase in the enthalpy during mixing of polymers (Tol et al., 2004; Cook et al., 2005; Zheng et al., 2007; Gold et al., 2017). In our research, we focused on the experimental determination of optimal conditions for the preparation of polymeric bicomponent mixed fibers from polymeric mixtures for thermodynamically incompatible polymers (PP, PA₆), and we studied important primary rheological characteristics for systems with the addition of the interfacial reagent.

2. THEORETICAL FOUNDATIONS OF PREPARATION OF POLYMER MIXTURES

Polymer blends are bi-component or multi-component polymer systems obtained by technological methods of mixing two or more polymers. This is due to the fact that it is possible to produce a large number of mixtures with a wide range of performance from limited number of components (Cook et al., 2005; Gold et al., 2017). Preparation of polymer blends belongs to one of the physical modifications, which result in changes in the supramolecular polymer structure and also a change in the original properties of the base polymers occurs (Scholz et al., 1989; Park et al., 1990; Han, 2007; Bhattacharyya et al., 2009). The most important method of preparing polymer mixtures is mixing the components in the melt (Pötschke et al., 2003). Each operation of mixing must have a process of distribution and dispersive mixing that is a mixing operation must be carried out such that the individual components (Scholz et al., 1989; Staropoli et al., 2017):

- are evenly distributed throughout the mass
- give strict deformation "history" of mixing.

Processes of create of polymer blends can be separated into operations involving formation of mixtures and processing operations. Mixing the polymers via extrusion is one of the easiest methods for preparing blends.

During the mixing operation the components of the mixture are distributed and deformed in the molten state to form a dispersion. A successful outcome of this operation is conditioned by the uniformity of size and dimensions of the dispersed or continuous phase (Scholz et al., 1989). During subsequent processing operations the phase structure of the mixed system can be further modified. There are changes during which dimensions of phases change. Coalescence takes place simultaneously (combining) to the particles of larger sizes (Cook et al., 2015; Mehrabi et al., 2015; Alexandrescu et al., 2017). In general mixing can be expressed as the growth of interfacial interface and drop in "furrows" of thickness or increase in the degree of segregation. Only macroscopic (technological) miscibility is achieved during the mixing of polymers (Steinmann et al., 2001). The mixture does not get divided when being stirred in the molten state into separated macroscopic phases due to the rapid rise in viscosity accompanying the cooling process. However, the separation takes place at the microscopic level and micro-heterogeneous structure is reflected in the properties of the system. Such mixtures also include mixtures of basic fiber-forming polymers. The structure of polymer blends after solidification is very complex and depends primarily on the rheological and thermodynamic aspects of mixing polymer components (Tol et al., 2004; Zheng et al., 2007; Van Hemelrick et al., 2004). Polymers suitable for the preparation of fiber-forming mixtures are mostly thermodynamically intolerant ones, which prevents the formation of a homogeneous system. Thermodynamic compatibility is the ability of polymers to create a homogeneous, single-phase, thermodynamically stable system. The stability of the created phase morphology is highly dependent upon the addition of interfacial agent, ensuring improved dispersibility and improved adhesion at the interface, thus improving the physical and mechanical properties of the polymer system (Ružinská, 2017; Mehrabi et al., 2015; Gold, 2017). In terms of intermolecular action we distinguish incompatible or pseudo compatible polymer blends, to which the abovementioned condition does not apply. The compatibility of components of the mixtures is the result of interactions between the same (cohesion), respectively different components (adhesion). Compatibility is usually manifested in polymers of similar chemical composition. Fiber-forming polymers (PP, PA₆, polyester, polyolefins) belong to groups of thermodynamically immiscible (intolerant) polymers. The outcome of polymer intolerance is the formation of the boundary as a result of the increase in the enthalpy during mixing of polymers (Cook et al., 2005; Gold et al., 2017). The relationship of deformation and flow of polymers - as significant parameters is studied and described by the rheology of polymers. Rheological properties are evaluated in terms of the orientation of the macromolecules in the flow deformation, which is related to the formation of the structure of the polymer and filament current and the processing properties of the polymer (Tol et al., 2004; Van Hemelrick et al., 2004; Hun, 2007; Staropoli et al., 2017). It is important to find out the relationship among the characteristics of the rheology of polymer melts viscosity belongs to one which is affected significantly by the factors such as temperature, polymer molecular weight, molecular weight distribution, shear values, additives in the polymer. Rheological properties of polymer melt mixtures are determined by the nature of the individual components as well as by the process of forming structures in the flow conditions (Cook et al., 2005; Han, 2007; Robertson, 2007; Zheng et al., 2007; Mehrabi et al., 2015; Gold et al., 2017; Ružinská et al., 2018).

3. EXPERIMENTAL PART

In experimental part were prepared polymer blends (mixtures) by remelting a mechanical mixture of granules of polypropylene (PP) and polyamide (PA₆), resp. interfacial agent copolymer polypropylene – maleic anhydride (MAH) using twin screw devices for various experimental determination manufacturing temperatures (from phase structure polymers) (Ružinská et al., 2017, 2018).

In order to study the impact of the ratio of the components and contents of interfacial agent these series of mixtures were prepared (Ružinská et al., 2017, 2018):

- Mixtures of various proportions of the components of polypropylene and polyamide 6.
- Mixtures prepared without interfacial agent were labelled PP/PA₆ and mixtures prepared by mixing polypropylene with polyamide 6, modified by 4% copolymer PP-MAH, were identified as PP/PA_{6M}. The following mixtures were prepared without addition interfacial agent: PP/PA₆ 90/10 and 80/20; PP/PA_{6M} 90/10, 80/20, 70/30, 60/40, 50/50.

3.1. Determination of rheological properties of polymers using capillary viscosimeter

Rheological properties were studied on semi-automatic discharge plastometer (capillary viscosimeter). The melt is extruded from the plastometer by a piston with weights that are placed in top of the device. A photocell measures the stream-time of a polymer of constant volume that is being extruded at the temperature: 260, 270 °C.

For the calculation of the apparent shear viscosity (Pa.s) from the shear parameters we used the equation (1):

$$\eta = \frac{\tau}{\gamma}$$

where: τ – is shear stress (Pa) , γ - shear rate (s⁻¹).

Calculated values of the difference of the actual and additive values of apparent viscosities (Pa.s) of polymer mixtures was determined according to (2):

$$\Delta\eta = \eta_{exp} - \eta_{adit}$$

In our research we then compared the apparent viscosities of the varied polymer mixtures with the viscosities calculated according to the Ostwald de Wael rheological equation.

4. RESULTS AND DISCUSSION

Rheological properties of polymer melt are one of the decisive processing properties of the polymer in fiber forming processes including the structures and properties of the final product. For the evaluation of the rheological properties on capillary viscometer we used a mixture of PP/PA_{6M} with a changing content of the dispersed component (polyamide containing 4 % wt. of interfacial agent) in the range of 10 % to 50 % wt. To assess the effect of interfacial agent to flow parameters of the mixtures we evaluated PP/PA₆ mixture prepared without interfacial agent containing polyamide 6 in the amount up to 20 % wt. Mixtures prepared without the interfacial agent, with more than 20 % wt. of polyamide phase, were very badly workable and practically not forming any fibers. The first step the solution to find appropriate processing conditions for the preparation of thermodynamically compatible polymer compositions was based on the results of our previous research on the specification of the rheological characteristics of the Ostwald de Wael and Carreau rheological models (Ružinská et al., 2017, 2018). In the following stage, we monitored the change in apparent viscosity of the mixtures depending on the composition and content of the interfacial agent. The measured and evaluated results are shown in the Figures 1 - 4.

Figure following on the next page

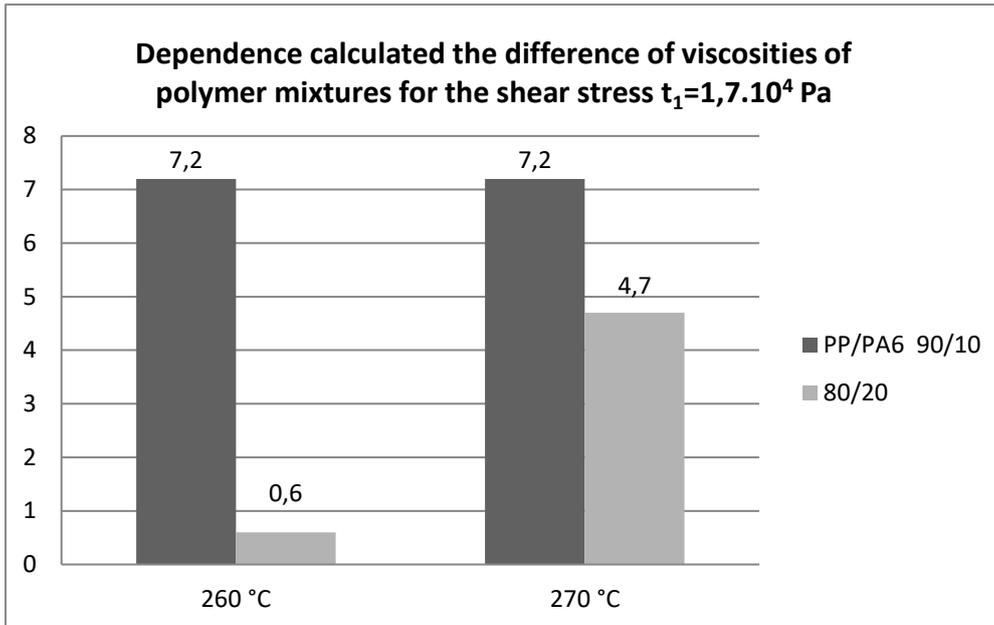

Figure 1: The dependence calculated the differences of viscosities of unmodified polymer mixtures PP/PA₆ for the shear stress $\tau = 1.7 \times 10^4$ Pa at the various processing temperature (Source: author)

In the Figure 1 and Figure 2 we can see the dependence calculated the differences of viscosities of unmodified polymer mixtures PP/PA₆ for the shear stress $\tau = 1.7 \times 10^4$ Pa at the various processing temperatures – 260, 270 °C. In the Figures 3, 4 are shown the dependence calculated the differences of viscosities of modified polymer mixtures PP/PA_{6M} 90/10, 80/20, 70/30, 60/40, 50/50 for the shear stress $\tau = 1.7 \times 10^4$ Pa at the various processing temperatures – 260, 270 °C.

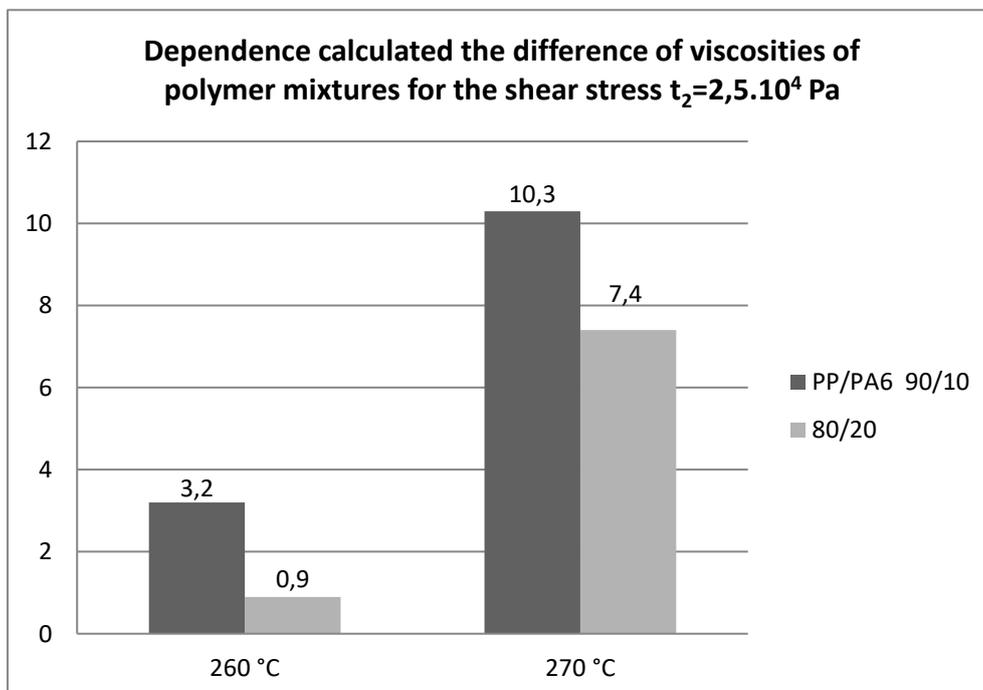

Figure 2: The dependence calculated the differences of viscosities of unmodified polymer mixtures PP/PA₆ for the shear stress $\tau = 2.5 \times 10^4$ Pa at the various processing temperature (source: author)

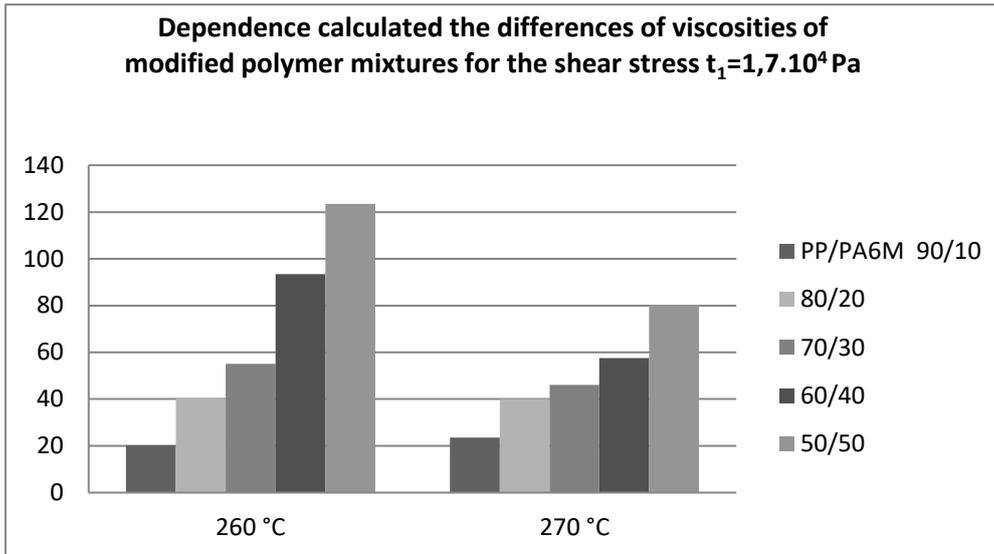

Figure 3: The dependence calculated the differences of viscosities of modified polymer mixtures PP/PA_{6M} for the shear stress $\tau = 1.7 \times 10^4$ Pa at the various processing temperature (source: author)

The role of interfacial agent in the formation of the structure of the mixtures, reflected in the rheological properties, was examined from the dependence of the apparent viscosity on the shear stress of the mixtures prepared by using intermediate stage respectively mixtures without the interfacial agent. While the apparent viscosity values of mixtures of PP/PA₆ (without intermediate stages) are close to the additive values, the apparent viscosities of the mixed melt prepared by using intermediate stage have significantly higher values (Figure 1, 2).

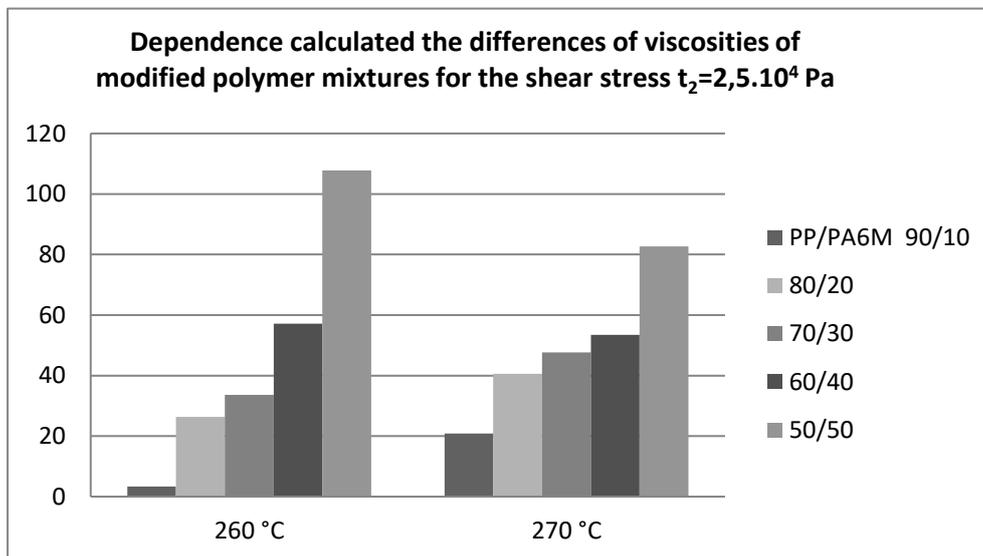

Figure 4: The dependence calculated the differences of viscosities of modified polymer mixtures PP/PA_{6M} for the shear stress $\tau = 2.5 \times 10^4$ Pa at the various processing temperature (source: author)

Viscosity values (Figure 1 - 4) of the mixtures increase with increasing content of the polyamide components, and their values are significantly higher than the additive values calculated from the pure components. Presumably, this is an indication of increasing tolerance of the system due to the high degree of components dispersion (Ružinská, 2017; Gold et al., 2017). The role of interfacial agent in the formation of the structure of the mixtures, reflected in the rheological

properties (Cook et al., 2005; Zheng et al., 2007), was examined from the dependence of the apparent viscosity on the shear stress of the mixtures prepared by using intermediate stage respectively mixtures without the interfacial agent (Ružinská et al., 2018).

5. CONCLUSION

In our research, we focused on the experimental determination the optimal conditions for the preparation of polymer blended by rheological characteristics. These polymer blends are used for manufacturing processes of preparation special fibrous polymer composites usable as efficiency filters in various industrial sectors. The evaluation of rheological characteristics (apparent viscosities) showed the following: polypropylene and polyamide 6 polymer blends, prepared without the use of interfacial agent can be prepared in conventional technological conditions of fiberization only at low contents (up to 20 wt. %) of the dispersed component. However, by using the interfacial agent it is possible to prepare PP/PA6 composite fibers in full concentration ratios. PP-MAH interfacial agent increases the degree of dispersion of the dispersed phase in the matrix of polypropylene, by which we get increased thermodynamic compatibility of the polymer components of the mixed fibers. We can assume that the increasing homogeneity of dispersion was due to increased technological compatibility of the components of the mixture. The degree of dispersity of the mixture increases because more interactions of macromolecular constituents during deformation are created. This confirms the crucial role of interfacial agents in increasing the tolerance of the system (Ružinská, 2017; Staropoli, 2017). However, by using the interfacial agent it is possible to prepare PP/PA6 composite fibers in full concentration ratios. PP-MAH interfacial agent increases the degree of dispersion of the dispersed phase in the matrix of polypropylene, by which we get increased thermodynamic compatibility of the polymer components of the mixed fibers. The addition of interfacial agent improves the degree of dispersity and adhesion at the interface and thus prevents the formation of pores (Ružinská et al., 2018). We expectee that product innovations of new prospective materials are a way of promoting strategic production innovations, and can significantly boost the unique position of a manufacturing companies in a competitive environment. Transfer of research results and its subsequent implementation into the manufacturing processes will allow for a relatively short time to implement product innovations with the expected results.

ABSTRACT

Paper considers the impact of cash, debt, trade credit and equity financing on firm efficiency. Paper argues that 1) cash holding negatively affects firm efficiency, 2) debt and trade credit have both positive and negative impact on efficiency, 3) debt and trade credit are more conducive to increasing efficiency than cash holding, 4) trade credit is more conducive to increasing efficiency than debt and 5) the strongest positive impact on efficiency is provided by equity financing.

Keywords: *capital structure, cash, debt, equity financing, firm efficiency, trade credit*

1. INTRODUCTION

The relationship between capital structure and efficiency cannot be ignored because the improvement in the efficiency is necessary for the long-term survivability of the firm. However in some cases, there is a conflict between efficiency and profitability. For example, when lending rates are low, firms can use more debt in order to increase profitability that negatively affects firm efficiency: growth in leverage increases the risk of default that forces firms to hold more cash as a buffer against possible insolvency in the future, which negatively affects return on assets (ROA). There are many empirical and theoretical researches devoted to relationship between capital structure and firm performance. The Modigliani and Miller (1958) claims that in an efficient market which has no tax, no transaction cost, no information asymmetry, the value of a firm is unaffected by how that firm is financed. Thus MM theory predicts that there is no relationship between a firm's capital structure and its performance (Modigliani and Miller, 1958). According to the "pecking order" theory informational asymmetries between the firm and external creditors make external financing more expensive than internally generated funds (Myers and Majluf, 1984). Therefore firms initially rely on internally generated funds (e.g., retained earnings) where there is no existence of information asymmetry, then use debt, then equity (Myers and Majluf, 1984). The agency cost theory suggests that significant amount of cash in balance sheet can generate agency problems, encouraging managers to invest in inefficient projects. According to Jensen a company that uses debt will be more efficient with its spending than a company that generates a lot of free cash as the threat caused by failure to service debt motivates firms to work more efficiently. However, on the other hand, the opportunities for firms to refinance debt reduce the incentives of firms to increase the efficiency for debt servicing. In this regard, paper argues that use of trade credit (installments sale) instead of debt, and prohibition of refinancing trade credit will positively affect firm efficiency. Paper also argues that equity financing is more conducive to increasing efficiency than debt and trade credit. Thus, paper argues that 1) cash holding negatively affects firm efficiency, 2) debt and trade credit have both positive and negative impact on efficiency, 3) debt and trade credit are more conducive to increasing efficiency than cash holding, 4) trade credit is more conducive to

increasing efficiency than debt and 5) the strongest positive impact on efficiency is provided by equity financing.

2. CAPITAL STRUCTURE OF NON-FINANCIAL FIRMS

Debt is typically large source of corporate finance in the USA and Euro area. In 2016 debt (debt securities and loans) amounted to 19% of total assets in the USA and 32% in the Euro area (Figure 1). Liquid assets – consisting of cash, bank deposits etc.– accounted for 6% of total assets in the USA and 7% in the Euro area. In the countries all over the world, share of cash in firms' balance sheets ranges between 10% and 23% (La Rocca et al., 2017).

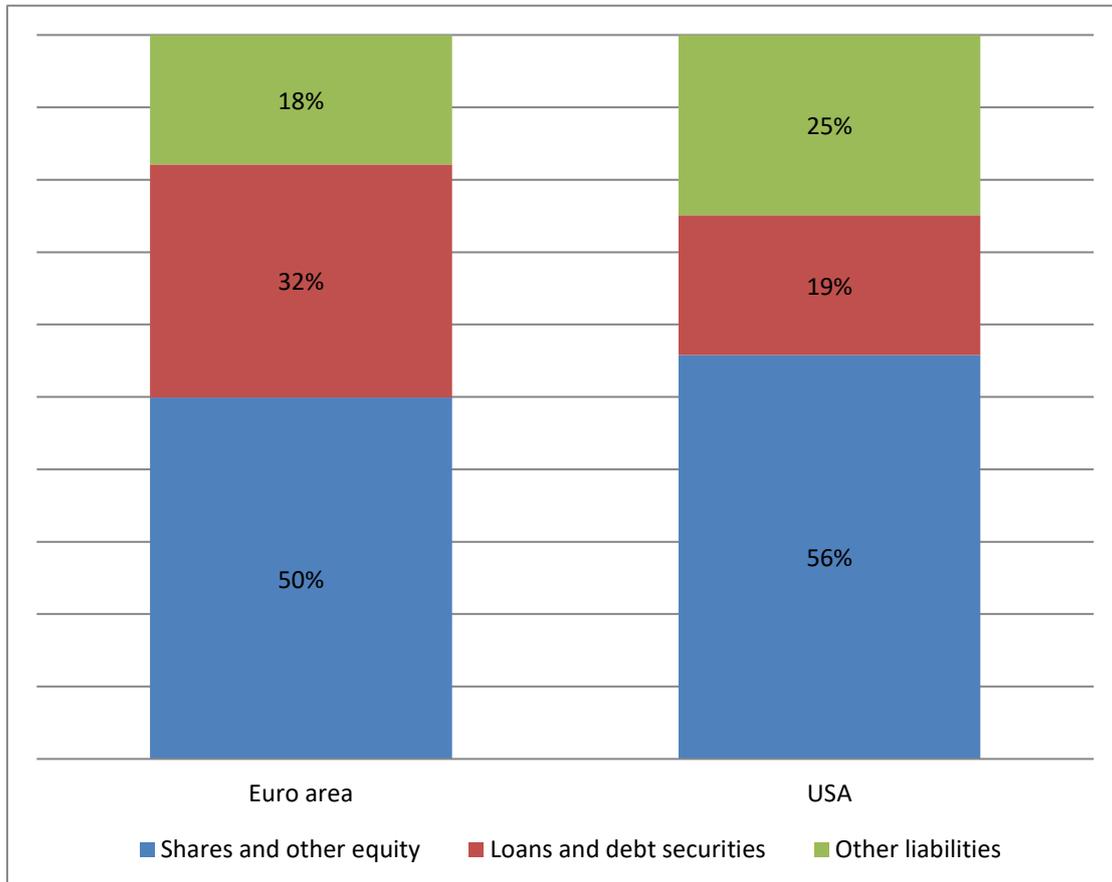

Figure 1: Liabilities of non-financial corporations in USA and Euro area, % of total liability, 2016 (FRS, ECB)

3. CAPITAL STRUCTURE AND FIRM EFFICIENCY

3.1. The effect of cash holding on efficiency

The effect of cash holding on efficiency is ambiguous. On the one hand cash holdings, in line with transaction and precautionary saving motives introduced by Keynes, have a positive impact on firm performance, particularly when the firm faces financial friction and in the presence of high cost of external financing. Cash holding allows firm to avoid the transaction costs of selling illiquid assets, converting them into cash, or using capital markets to raise funds to secure resources to meet payments due. In the precautionary motive, cash holdings function as a buffer against possible adverse shocks in the future. On the other hand cash holding negatively affects return on assets (ROA) as significant amount of cash in balance sheet indicates that a company is not using its assets to generate maximum possible revenue. Significant amount of cash in balance sheet can also generate agency problems, encouraging managers to invest in inefficient projects (Jensen, 1986).

3.2. The effect of debt on efficiency

According to Jensen, debt positively affects firm efficiency (Jensen, 1986). Jensen's argument is that debt creates default risk and the threat caused by failure to service debt motivates firms to work more efficiently (Jensen, 1986). According to this line of thought, debt produces a stimulating effect originating from the obligation to service the debt on time. Thus, according to Jensen, a company that has debt on which cash must be spent will be more efficient with its spending than a company that generates a lot of free cash. However there is negative effect of debt on efficiency of firms. Thus, leverage increases the risk of debt defaults that forces firm to hold more cash as a buffer against bankruptcy. However the increase in ratio of cash to total assets negatively affects return on assets. It would be noted that some authors argue that high level of debt decreases the amount of cash holding in balance sheet (Ferreir and Vilela, 2004). Argument is that high indebtedness of firm could mean that it has easy access to credit and close relationship with banks allows the firm to hold less cash for precautionary reasons (Ferreira and Vilela, 2004). It is true during easy monetary policy when years of cheap money lead firms to hold cash at levels that do not reflect debtor risk, but this is not sustainable as when Central bank tightens policy, level of cash increases. Moreover, the opportunities for firms to refinance debt servicing reduce the stimulating effect of debt on firm efficiency.

3.3. Trade credit and firm efficiency

The other possible source of financing for firms is trade credit (installment sale). A trade credit is an agreement in which a customer can purchase goods, paying the supplier at a later date. Trade credit is essentially credit given by one firm to another, however in Islamic finance trade credit is extended not only by firms but also by banks. As is known, interest on debt is forbidden in Islamic finance, and banks therefore, instead of loan, extend Murabaha trade credit. In particular, banks purchase goods, on the client's request, from a third party and resell it to client in installments at an agreed mark-up. And as in Islamic financial system financing is linked with purchasing goods, firms may not refinance trade credit that forces them to work effectively to pay for the goods. Thus, as trade credits are more conducive to increasing efficiency than debt, use of trade credit instead of debt, and prohibition of refinancing trade credit will positively affect firm efficiency. However, like debt, trade credit also has negative impact on efficiency. This is because purchase in installments, like debt, is firms' obligation that also forces firms to hold cash as a buffer against defaults.

3.4. The effect of equity financing on efficiency

The strongest positive impact on efficiency is provided by equity financing. According to Nucci et al. (2005) it is due to the fact that market-based financial systems drive to higher levels of real economic activity (Nucci, Pozzolo, and Schivardi, 2005). Positive relationship between equity financing and firm efficiency is also due to the fact that as, in contrast to debt, issuing shares doesn't create risk of default, firms are not required to hold cash as a buffer against debt defaults that positively affects efficiency.

4. CONCLUSION

Significant amount of cash in balance sheet can generate agency problems, encouraging managers to invest in inefficient projects. In order to increase efficiency Jensen argues to use debt since the threat caused by failure to service debt motivates firms to work more efficiently. However the opportunities for firms to refinance debt servicing reduce the stimulating effect of debt on firm efficiency. Thus, paper argues that use of trade credit instead of debt, and prohibition of refinancing trade credit will positively affect firm efficiency. Paper also argues that the strongest positive impact on efficiency is provided by equity financing. This is due to the fact that in contrast to debt and trade credit, issuing shares doesn't create risk of default, and

firms therefore are not required to hold cash as a buffer against debt defaults that positively affects efficiency. Thus, in view of the above, paper argues that 1) cash holding negatively affects firm efficiency, 2) debt and trade credit have both positive and negative impact on efficiency, 3) debt is more conducive to increasing efficiency than cash holding, 4) trade credit is more conducive to increasing efficiency than lending and 5) the strongest positive impact on efficiency is provided by equity financing.

SUSTAINABLE DEVELOPMENT OF TOURISM IN AZERBAIJAN: CURRENT SITUATION, PROBLEMS AND SOLUTION

Gadir Bayramli

*Azerbaijan State University of Economics (UNEC), Azerbaijan
kadirbayramli@gmail.com*

ABSTRACT

In the non-oil sector of Azerbaijan, tourism is seen as one of the most promising areas. Azerbaijan has a strong potential to develop tourism with rich natural and historical-cultural recreation resources. After gaining independence in 1991, a new tourism strategy was developed in the country and an independent tourism policy was started. Taking into account the importance of tourism for the country, tourism development priorities and targets have been identified in regional development programs as well as on tourism related documents. The "Strategic Road Map", approved in December 2016, can be considered as a new stage in the development of the country's tourism. In recent years, the positive results of the measures taken in the field of tourism infrastructure development, promotion and personnel training in Azerbaijan are observed. Growth in the number of foreign tourists visiting the country and revival in domestic tourism are indicators of progress in tourism. In Azerbaijan tourism development is essential for the protection of nature, such as the conservation, rational use of natural and historical-cultural recreation resources, solving existing problems in tourism and ecotourism in order to sustain sustainable development of tourism.

Keywords: *sustainable tourism, tourist infrastructure, strategic roadmap, ecotourism*

1. INTRODUCTION

Tourism is a powerful factor of the economy, an influential social institution, as well as a public welfare and culture of the society. It promotes the growth of people's living standards and their spiritual enrichment. Increasing the contribution of tourism to the country's economy, the rational use of natural resources and the high competitiveness of tourism destinations, led to its sustainable development. Socio-economic development of Azerbaijan has opened new opportunities for sustainable development in tourism. In a country with a rich tourism potential, a range of measures taken in acceleration of tourism reforms, strengthening of infrastructure and protection of environment can be seen as important steps towards the sustainable development of tourism. The multidimensional research and development perspectives of this field are crucial in ensuring sustainable development of tourism. In this article, the current situation and problems of sustainable tourism in Azerbaijan have been analyzed and solutions have been sought. The article outlines the differences in sustainable tourism among developed countries and developing countries, including Azerbaijan, and states the need for a sustainable tourism model for developing countries. Taking into account the relevance of the topic, sustainable tourism and its significance, tourism in Azerbaijan, the reforms in the independence period have been analyzed, the potential of regions in terms of tourism sustainability has been evaluated and comparative analysis and generalization methods have been used in the article along with statistical and regional analysis methods.

2. BRIEF OVERVIEW OF HISTORY OF TOURISM

Looking at the history of travels in Azerbaijan, it is still possible to see that trade in the Middle Ages was mainly for trade, religious visits and treatment. Caravanserais, built between major and middle cities as well as trade points, were the main overnight destinations. In the Middle Ages, those who visited Ateshgah temple in Absheron dominated India and other eastern countries.

Visits from the country are mainly focused on the cities of Mecca, Mashad and Karbala. Religious sites and therapeutic centers prevail among the regions visited throughout the country. In the second half of the 19th century, Azerbaijan became one of the world's oil centers, increasing the flow of Western businessmen and companies to the country, and played an important role in the construction of European-style hotels. At that time, sharp increase in tourism travel made by Azerbaijani rich people to Europe and Russia can be seen as well. Rapid development of the oil industry has changed the cultural landscape of the capital Baku. Today, many magnificent buildings attracted by foreign tourists have also been built by oil millionaires at that time. After the establishment of the Bolshevik government in Azerbaijan in 1920, the nature of development of tourism changed and tourism was developed within the framework of the Soviet system. In the Soviet era, especially after the Second World War, the construction of social enterprises expanded, ten tourist bases were opened in Azerbaijan, and touristic routes were organized to different regions. The vast majority of tourists coming to Azerbaijan in that period were from other Soviet republics, and in the 1980s the number of tourists coming beyond the Soviet Union was around 50,000. The majority of foreign tourists were citizens of the socialist countries, and the main place of visit was Baku. In the Soviet era, Azerbaijan's tourism potential was not properly evaluated, and environmental protection measures were insufficient. At that time, opportunities for exploring the impact of tourism on the environment were limited and no serious investigations were carried out on this issue. Despite promoting the development of mass tourism in the Soviet Union, tourism infrastructure, personnel training and service levels have dropped far short of international standards. Decisions of the USSR and the Council of Ministers on the development of tourism on the Caspian coast of Azerbaijan were accepted, but the collapse of the Soviet Union did not allow this to happen.

3. AZERBAIJAN TOURISM IN INDEPENDENCE PERIOD

The main objective of the first 10 years of independence of Azerbaijan was to ensure economic stability, but there was no progress in the development of services, including tourism, but some of the people who left their homes after the occupation of Armenia were placed in tourist camps and sanatoriums. Thus, in the first years of independence, as in other sectors of the economy, tourism also experienced a decline, while economic stability in the late 1990s also had a positive effect on tourism. Adoption of the Tourism Act on June 4, 1999, stimulated the development of infrastructure and the opening of tourism companies, and accelerated the process of contributing region's recreational resources to tourism. Significant changes in the field of tourism in Azerbaijan happened in the beginning of the 21st century. By the decree of President of the Republic of Azerbaijan dated August 27, 2002, No. 1029, the "State Program on the Development of Tourism in the Republic of Azerbaijan for 2002-2005" was approved, and the conditions for the efficient use of tourism potential have been created (Soltanova, 2015, p.162). State Program on Tourism Development in the Republic of Azerbaijan for 2010-2014 (April 6, 2010), State Program on the Development of Resorts in the Republic of Azerbaijan for 2009-2018 (February 6, 2009) and "Tourism Strategic Roadmap for Industrial Development" (December 6, 2016) aims to transform tourism into one of the leading sectors of the country's economy. These documents are of great importance in terms of ensuring the sustainable development of the tourism sector. Implementing a series of activities related to tourism education during the years of independence has contributed to the training of qualified personnel. In 2006, the Azerbaijan Tourism Institute was established and in 2014 it was renamed the Azerbaijan University of Tourism and Management. In this high school, personnel covering key areas of tourism are being trained. Additionally, tourism faculties have been opened at several universities of Azerbaijan, and staff training has started in the regions. It should be noted that, despite certain improvements in staff training in the field of tourism, there are a number of problems in this field.

Implementing reforms in the tourism sector has shown its positive results. Strengthening the stability and tourism infrastructure in the country made it possible to hold the 2012 Eurovision Song Contest, the 1st European Sports Games in 2015, and the Islamic Solidarity Games in 2017.

4. CURRENT SITUATION OF TOURISM IN AZERBAIJAN

Over the past 25 years, significant work has been done in the field of tourism development in Azerbaijan, the legislative base of tourism has been strengthened, promotion activities have been expanded, and state programs on the development of this sphere have been prepared. Thanks to these measures, significant increases have been registered in the number of foreign tourists, as well as hotels and travel agencies. The dynamics of foreign tourists can be found in the table below.

Table 1: Breakdown of foreigners and stateless persons arriving to Azerbaijan (The State Statistical Committee of the Republic of Azerbaijan, Statistical Yearbook (publication) 2018, p 25.)

	2013	2014	2015	2016	2017
Number of foreigners and stateless persons arrived to Azerbaijan	2 508,9	2297,8	2 006,2	2 248,8	2 696,7
including tourism purpose of which:	2 129,5	2159,7	1 921,9	2 044,7	2 454,0
leisure, recreation tourism	705,2	709,9	668,8	697,1	839,3
business tourism	648,9	670,5	632,3	691,7	834,4
treatment tourism	46,2	46,3	36,5	41,5	49,1
religious tourism	13,7	13,7	11,5	12,6	14,7
visiting friends and relatives	673,7	677,1	542,0	562,0	674,9
other tourism purpose	41,8	42,2	30,8	39,8	41,6
other purpose	379,4	138,1	84,3	204,1	242,7

Looking at the tourism market of Azerbaijan, we will witness the increasing number of tourists from different countries every year. If in 2005, 692,700 foreign tourists visited Azerbaijan, then in 2009 this figure was equal to 1.0 mln. In 2010, it reached 1.9 million people (Soltanova, 361). Although the number of tourists coming to the country in 2015 has dropped slightly in comparison with 2014, in 2017 it was about 2.5 million. In recent years, it is possible to observe that tourists come mostly on recreational or business purposes, or just to see their relatives. In recent years, there has been some increase in the number of visitors for both treatment and religious purposes. Once capacity of hotels and similar establishments changes by economic regions. In 2017, capacity of hotels throughout the country was 41611 bed places, 15781 bed places (38%) were in Absheron economic region (including Baku). The capacity of Guba-Khachaz on this indicator was 10162 (24.2%), Shaki-Zakatalan - 4308 (10.3%). The total capacity of remaining 7 economic regions was 27.5 % (The State Statistical Committee of the Republic of Azerbaijan, 2018, p.62-63.). 40% of hotels are in Absheron and surrounding territories because of the capital city of the country which locates in this territory, as well as its favorable geographical position and historical development. The relative elevation of the number of places in Guba-Khachmaz and Sheki-Zakatala regions is due to the richness of natural recreation resources and the development of transport infrastructure. Economic regions with an absolute majority of hotels are the most popular tourist destinations in the country. 40.4% of foreign tourists coming to Azerbaijan used automobile, 42.7% airlines, 11.4% of railways, 0.7% by sea and 4.8% by other transport routes. (The State Statistical Committee of the Republic of Azerbaijan, 24). As it is seen from the statistics, only a small number of tourists coming to the country have used sea and railways. This is due to the lack of speed and low comfort levels of off-road vehicles. Inefficient use of cruise tourism potential is one of the weak points of tourism in Azerbaijan.

The low level of comfort in the majority of trains, the lack of infrastructure and the low level of service lead to less use of the railways by tourists. Launching of the Baku-Tbilisi-Kars railway in 2017 has increased the importance of railways in terms of tourism. At the initial stage, one million passengers will be transported by this line. This figure is expected to rise to 3 million in recent years. For the passenger trains operating on the Baku-Tbilisi-Kars route, the Azerbaijani side has ordered 30 types of wagons to the Swiss company Stadler. Wagons are manufactured in four categories: "standard", "comfort", "business" and "restaurant". Azerbaijan Railways CJSC plans to organize passenger transportation by 2019 in Baku-Tbilisi-Kars route. For this purpose, new wagon types produced by Swiss STADLER Rail Group will be brought to Azerbaijan in the first quarter of next year. At present, German Donauwörth and Treuchtlingen railway stations are tested for all parameters of passenger carriages, which will operate on the Baku-Tbilisi-Kars railway route (Azerbaijan Railways Department, 2018, <https://ady.az/az/news/read/990/43>).

5. SUSTAINABLE TOURISM AND ITS IMPORTANCE

Sustainable development term started to gain importance and be discussed thanks to World Commission on Environment and Development (WCED) published in 1987 and called Brundtland Report shortly. According to WCED sustainable development is described as “a development that meets the needs of the present without compromising the ability of future generations to meet their own need” (WCED, 1987, p.42). Expressed simply, sustainable tourism can be defined as: "Tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, the industry, the environment and host communities" (WTO, 2018, <http://sdt.unwto.org/content/about-us-5>). Factors such as natural and cultural-historical recreation resources, tourism infrastructure, ecological legislation, geographical location of destinations, availability of qualified personnel and public awareness of environmental awareness play a crucial role in the development of sustainable tourism. The effectiveness of sustainable tourism depends on the level of development of countries. Developed European countries, as well as the United States, Canada, Japan, have developed infrastructure and are pursuing an environmental protection policy. These countries, which have rich tourism traditions, prefer the use of "environment-friendly" technologies. In these countries, the importance of the Environmental Impact Assessment (EIA) reports and the implementation of a strong control system over the Carrying Capacity are of great importance in optimizing the economic impact of economic activities. Therefore, developed countries have achieved success in the development of sustainable tourism. The level of development of sustainable tourism in developing countries is even lower. Many of these countries are trying to get as many tourists as possible and to maximize their tourism's economy. In developing countries, trends in the development of mass tourism are hampering the transition to sustainable tourism. While many countries have different economic and political systems and different development levels, most countries see sustainable tourism as one of the priority areas. It is better understood that sustainability of tourism is important for its stable development. Due to development of sustainable tourism, it is possible to preserve both natural and historical-cultural recreation resources, improve their quality, and preserve them for future generations. On the other hand, improving the welfare of the peoples, raising the satisfaction of visitors, enlightenment of tourists and indigenous people on the environment, preserving the aesthetic appearance of natural and cultural landscapes are among the main goals of sustainable tourism. Targeted development and poverty reduction measures make sustainable tourism more attractive.

6. CURRENT SITUATION OF SUSTAINABLE TOURISM IN AZERBAIJAN

Sustainable tourism development in Azerbaijan is characteristic of developing countries. A number of reforms have been performed in relation to the development of tourism, a certain infrastructure has been created, tourism legislation has been improved, and a network of hotels that can accommodate 4-5 million tourists a year in a country with a population of 10 million has been established. The necessity of sustainable tourism development has been highlighted in tourism travel programs and the Strategic Road Map, and sustainable development of tourism has been included in the priority targets. At the same time, it is encouraged to optimize the impact of tourism on the environment, to develop ecotourism, pasture tourism and agrotourism. In recent years, enhancing environmental protection, expanding the range of protected areas, and applying modern technologies for environmental control are crucial for the sustainable development of tourism. The application of the Asan Visa system accelerated the flow of foreign tourists. In recent years, tourism destinations network has been expanded in the country, enhancing environmental protection in tourism areas, opening new jobs in the region, increasing income of local residents from tourism, and organizing gourmet tours to the regions have boosted hopes for sustainable tourism development. The necessity of awareness-raising activities in the field of sustainable tourism has become clear and the first steps have been taken in this area. The announcement of tourism as one of the priority areas among non-oil sectors and expanding the scale of reforms in the tourism sector is of great importance in terms of sustainable tourism development. The Tourism Roadmap on the Strategic Roadmap on the Development of Tourism Industry has highlighted the importance of sustainable tourism development: "The tourism sector is a continuation of environmental sustainability, cultural heritage, and protection and development efforts "(<https://president.az/articles/22134>, 2016). Establishment of the State Tourism Agency of the Republic of Azerbaijan in 2018 can be considered as an important step in the development of sustainable tourism in the country.

7. PROBLEMS OF SUSTAINABLE TOURISM IN AZERBAIJAN

Despite some progress in the field of tourism in Azerbaijan, there are a number of problems that hinder the sustainable development of tourism. These problems that cover most areas of tourism can be summarized as follows:

- Tourism infrastructure is poor and it is felt especially at overnight stays and transport.
- Hotels have been distributed unevenly across the country and one-third of them are gathered in the Absheron Peninsula, where the capital Baku is located.
- Low quality of services in hotels, motels and camping stays.
- There is a shortage of qualified personnel in the field of tourism, and 10% of the employees in the field of tourism are qualified personnel.
- Environmental protection measures related to tourism destinations are insufficient.
- The Caspian Sea and coastal zones, which are considered to be an important tourism destination, have been polluted with oil waste. The lands polluted in Absheron peninsula more than 10,000 hectares.
- There are gaps in the field of tourism legislation.
- There is no clear statistical information on domestic tourism activities.
- The number of scientific researchers in the field of sustainable tourism is limited and limited.
- There are a number of shortcomings in the sphere of tourism education. There are fewer quality textbooks available, and researchers and students have limited experience.
- Enlightenment measures in the field of tourism and ecological consciousness are insufficient.

- The norms relating to carrying capacity are not complied with and do not comply with Environmental Impact Assessment (EIA).
- Investing in tourism is insufficient, and bureaucratic maneuvers make it difficult.
- Tourism promotion and advertising are not enough.

In recent years, tourism development has created a basis for sustainable tourism development in the country, but the country is still at the forefront of sustainable tourism.

8. SUGGESTIONS FOR SOLUTION OF SUSTAINABLE TOURISM PROBLEMS

In our opinion, implementation of the following measures can have a positive impact on sustainable tourism development in Azerbaijan:

- Preparation and implementation of a special vaccine program for sustainable tourism.
- To develop tourism infrastructure in the regions using the experience of developed countries.
- Improving the quality of service and increasing the range of tourism enterprises.
- Taking into account the carrying capacity of the regions in the organization of tourism routes.
- Development of tourism education, preparation of high quality textbooks, taking measures to promote environmental awareness of secondary schools.
- Ensuring internships for students and researchers of local tourism institutes at foreign universities and tourism organizations.
- Improving ecotourism and tourism legislation.
- Strengthening environmental protection measures and making the use of treatment facilities in enterprises.
- Expansion of scientific research in the field of tourism, organization of international and national congresses on sustainable tourism.
- Expansion of participation in international tourism exhibitions.
- Expansion of advertising on country tourism.
- Implementation of modern technologies for regular monitoring of ecological situation in tourism destinations.
- Application of modern methods of domestic tourism statistics preparation in the country.
- Detailed study of the impact of tourism activities on the development of regions.
- Development of the gifted goods sector.

Implementation of the above-mentioned measures can accelerate the development of sustainable tourism and increase the contribution of tourism to the country's economy.

9. EVALUATION OF SUSTAINABLE TOURISM POTENTIAL OF AZERBAIJAN

The potential of sustainable tourism in Azerbaijan is diverse according to regions. One of the main goals in our article is to evaluate the sustainable tourism potential of the regions. During the evaluation of the sustainable tourism potential of each region, natural and historic-cultural recreation resources, tourism and transport infrastructure, environmental degradation rates have been used. The natural and economic resources generating the tourism potential of each region are assessed by a 10-point system. The points given to the indicators were summed up and divided by the number of indicators and average number was calculated.

Table following on the next page

Table 2: The potential of sustainable tourism of Azerbaijan in regions (Bayramli, 2018)

Economic regions	Indicators						Average indicator
	Climate	Hydrography	Forest resources	Transportation	Historical-cultural recreation resources	Ecological purity degree	
Absheron (including Baku)	7	3	3	10	10	5	6.3
Guba-Khachmaz	7	7	8	8	6	8	7.3
Sheki – Zagatala	8	8	8	7	7	8	7.6
Ganja-Gazakh	7	8	6	7	7	7	7.0
Lankaran	8	8	8	7	6	8	7.5
Aran	5	6	3	6	6	6	5.3
Upper Garabag	9	6	6	8	8	6	7.1
Kalbadjar-Lachin	7	7	5	6	7	5	6.1
Daghlig Shirvan	7	7	8	6	7	7	7.0
Nakhchivan	7	6	6	6	8	7	6.6

It is possible to classify the regions in terms of sustainable tourism potential. The regions with average point over 7 (Guba-Khachmaz, Shaki-Zakatala, Ganja-Gazakh, Upper Garabagh, Daghlig-Shirvan) are high, 6-7 points (Absheron, Kalbajar-Lachin and Nakhchivan) regions - moderate, and less than 6 points can be referred to regions with a weak tourism potential. Depending on the development of sustainable tourism in Azerbaijan, it is possible to change places in the upcoming classification system in the future.

10. SUMMARY

Azerbaijan, with rich natural and historical-cultural resources, has broad opportunities for the development of sustainable tourism. The reforms in the tourism sector during the years of independence, state tourism programs and the preparation and implementation of the Strategic Road Map, the development of transport, hotel and other infrastructure, and environmental protection have created a basis for sustainable tourism development in the country. New tourist destinations have been created in the direction of development of tourism and the flow of foreign tourists to the country has increased. As a result of sustainable tourism potential assessment in Azerbaijan, Guba-Khachmaz, Sheki-Zakatala, Ganja-Gazakh, Upper Garabagh, Daghlig-Shirvan regions are more promising in terms of sustainable tourism is seen. It should be noted that along with the development of sustainable tourism in the country, there are a number of problems. In developing countries, including Azerbaijan, strong tourism infrastructure should be established, environmental protection measures should be strengthened, staff training should be improved in the field of tourism, Environmental Impact Assessment (EIA) reports need to be made compulsory. Sustainable tourism in Azerbaijan is characteristic of developing countries and a special model of sustainable tourism different from developed countries should be applied to these countries. The occupation of 20% of Azerbaijani lands by Armenia, the presence of densely populated tourism resources in the occupied territories, destruction of natural landscape and economic and social infrastructure in occupied territories have made Azerbaijan unable to utilize tourism potential.

After withdrawal of Armenia from occupied territories, it will be possible to use the rich tourism potential of Nagorno-Karabakh and its surrounding regions. Thanks to the continuation of tourism reforms, the planned tourism policy and the public-private sector partnership in the field of tourism, Azerbaijan can become a country where sustainable tourism develops.

MECHANISMS OF NATURAL RESOURCE REVENUES AND ECOLOGICAL BALANCE

Ceyhun Hajiyev

Azerbaijan State Economic University, Azerbaijan
ceyhun.g.haciyev@gmail.com

ABSTRACT

Economists and politicians in many countries predict the collapse of the economy's commodity models. This is largely due to the future depletion of certain natural resources. Partly knowing this risk is still a lot of doubt. But the main threat to the operation of the "raw material economy" is the formation of the so-called economy of information. The resource economy is aimed at studying and evaluating economic resources, especially resources - public goods, when determining their optimal placement. The methodological basis of resource economics is a system of methods and tools for non-valuable valuation and this allows for determining costs or benefits related to resources that are free of charge. In many countries, active research is being carried out to improve the use of alternative fuels and resources. Therefore, knowledge becomes a kind of multiplier that increases the value of other economic resources. Countries with rich mineral resources need to start shaping elements of knowledge economy by increasing the scientific and technical potential, increasing the scientific and technical potential by obtaining a supercontrol by reducing the dependence on natural resources in the long run, using dependency on external systems.

Keywords: *ecological balance, environmental economics, ecological economics, environmental taxes, ecological policy*

1. INTRODUCTION

As we know, the 21st century has been declared a century of ecology, sustainable development, health in the world. It is for this reason that this global-scale problem has always been and remains the focus of world scholars at all stages of society's history. Research shows that the dispute with the scientist working in these areas is still ongoing. In general, recent studies on the regulation of the world, local and regional environmental safety problems in the world are insufficient. In particular, the studies on the establishment of a regulatory legal framework for environmental safety should be further expanded. In the modern era, the causes of environmental threats are military, economic and social, travel and terrorism. If the threat of military threat - the global nuclear war, the proliferation of weapons of mass destruction, international armies, major wars and local conflicts, economic and social hazards. Connections between environmental protection and international trade have been recognized for many decades. In recent years the political rise of environmentalism has focused acute attention on possible conflicts between environment and trade values and rules. National environmental law has become more comprehensive and more central in most polities, and present or proposed measures of environmental protection often touch matters addressed by international trade rules. (Environmental Regulation and Economic Growth, By A. E. Boyle, 1994, pp 189-190).

2. ECONOMIC DEVELOPMENT AND DIRECTIONS TO SOLVE THE PROBLEMS OF AND ENVIRONMENTAL PROTECTION

Implementation of the principles of protection of natural resources, science-based development at the national, international and regional levels by strengthening the coordination of state activities in the field of environmental protection in order to achieve ecologically sustainable socio-economic development, ensuring the sustainability of the country's economic and human resources should be implemented.

'The materials balance principle' is the term that economists tend to use to refer to the law of conservation of mass, which states that matter can neither be created nor destroyed. (Perman et al, 2003, pp-22). It is essential to eliminate and limit the serious environmental problems that arise during economic activity to ensure sustainable development from ecologically sustainable and can be achieved by fulfilling the following objectives in interconnectedness:

- Using appropriate methods of managing economic and human potential to improve the quality of the environment;
- the creation and use of economic models and technologies that stimulate the well-being of present and future generations;
- implementation of guarantees between representatives of the same and different generations on the principles of fairness;
- Protecting systems, ecosystems and biodiversity that can provide human life.
- The implementation of these tasks is based on the following principles:
- Implementation of the decision-making principle, taking into account short-term and long-term economic, environmental and social outcomes and probable consequences;
- taking into account alternatives in decision-making processes;
- Preventing the implementation of economic, social and environmental projects that may cause irreversible damage to any component of the environment;
- Ensuring strong and diversified economic development, allowing allocation of funds for environmental protection and sustainable development;
- Expansion of involvement of representatives of public and non-governmental organizations in decision-making process in sustainable development and environmental protection.

Natural resource availability and environmental factors are not seen as providing significant limits to economic growth. Indeed, the most optimistic thinkers see economic growth as a positive means to reduce scarcity permanently through the accumulation of capital and knowledge and other effects. Some growth optimists see global advantages through greater economies of scale and argue that economic growth results in a faster rate of technological progress (Tisdell, 1990, pp 2-5). In Europe, the United States, Japan and China, active and highly successful scientific studies are being carried out to create the most powerful thermoelectric power plants capable of meeting the demand for a long-term country and several countries. Solar power stations and their placement in space are the following. Two models can be combined organically: the information in the resource model can be regarded as an economic resource, and resources themselves can be the main object of studying the knowledge economy. Unlike many resources, information and knowledge can be used indefinitely and are actually used more and more. In this context, the information acquires the characteristics of capital as an increasing value. Resources are available in quantitative and qualitative levels. This is a quantitative character that reflects the volume and speed of resource utilization and the quality of the potential that they can afford. Quantitative characteristics of resources and the level of utilization of them reflect the efficiency of resource utilization. At the same time, quantitative characteristics of resources can increase or decrease resource potential from a quantitative perspective. For example, while the world oil market price fell to \$ 38 per barrel in 2014, the oil price in Azerbaijan in 2014 was \$ 60-70 in October 2018. On the other hand, resources are not the same as quality. The quality of the mineral raw material is determined by its composition, ie the rate of the ingredients contained in it. Land quality is determined by their fertility rate. The development of resource potential (resource resources) is related to the complexity, completeness and substitution of resources. Resource complexity is expressed through the acquisition of some of their resources. At the same time, complex utilization of resources reduces the production of natural raw materials. For example, during oil extraction it is obtained in natural gas.

The nature of the resources to complement each other is explained by the fact that sometimes there are some resources in the production process. The production process can not be started as a result of at least one of them. For example, raw materials, fuels, fixed and circulating funds and labor resources complement each other in the production process. The ability to replace resources contributes to achieving the desired result as a result of the use of different resources in different ways. That is, the same resource can be used by replacing other resources to meet different functional requirements in different fields. For example, petroleum gas can be replaced by gas, coal, atomic energy, metal plasma in industry, and labor resources can be replaced by machines and equipment. From the point of view of ecological security, opportunities for replacement of resources within the national economy are constantly examining and expanding towards expansion. At the same time, this feature can be applied both to internal and external resources. Thus, a number of raw materials, fuel and other resources can be imported, which is due to their cheaper receipt. Therefore, taking into consideration the economic growth and the depletion of a number of resources, various countries take this step by increasing their reputation. The functions of the state in the mixed economy include the establishment of legal basis for economic decisions, the stabilization of the economy, the achievement of macroeconomic and structural balance, the development strategy, and the creation of favorable investment, business environment, resource allocation, and economic and environmental security, and solution of social problems, these functions include specific areas, regions, spheres of regulation in the transitional period. The policy objectives should be based on the criteria system that forms the basis of the state, society and economic entities. All of this, in turn, is a constant focus on preventing the initial quantitative and qualitative changes in the environmentally-friendly tangible assets and the need for future generations to utilize the natural environment, leading to a breach of the ecological sustainability of the environment to meet the social and economic needs of the community a consistent monitoring of the use of natural resources efficiently and economically without regulating the environment, ecological sustainability of the environment, and the preservation of biodiversity and the sustainable use of ecological systems expansion.

2.1. Ecological and environmental economics. basic mechanisms of difference

Ecological economics is an interdisciplinary area between economics and ecology. Their goal is to develop models that can analyze economic, social and environmental conditions in the form of a network, embedded and evolving system. Environmental economists mainly study the social and political problems of environmental economics. Her work focuses on identifying conditions for a sustainable socio-economic system and developing a model that describes it. Ecological economics is based on ecosystems and is trying to find a solution to conflicts between the economy and society on this basis. After successfully determining the relationship between the economy and the environment, plans and recommendations for adjustments aimed at creating a socio-economic system in harmony with the biosphere can be developed. Opinions of environmental economists are not same . Among the most prominent scientists in this field: Schumacher E., Boulding K. E., Costanza R., Carten D.

2.2. Comparison of ecological and environmental economics

Figure following on the next page

Ecological Economics	Traditional Environmental and Resource Economics
1. Optimal scale	1. Optimal allocation and externalities
2. Priority to sustainability	2. Priority to efficiency
3. Needs fulfilled and equitable distribution	3. Optimal welfare or Pareto efficiency
4. Sustainable development, globally and North/South	4. Sustainable growth in abstract models
5. Growth pessimism and difficult choices	5. Growth optimism and “win-win” options
6. Unpredictable co-evolution	6. Deterministic optimisation of intertemporal welfare
7. Long-term focus	7. Short to medium term focus
8. Complete, integrative and descriptive	8. Partial, monodisciplinary and analytical
9. Concrete and specific	9. Abstract and general
10. Physical and biological indicators	10. Monetary indicators
11. Systems analysis	11. External costs and economic valuation
12. Multidimensional evaluation	12. Cost-benefit analysis
13. Integrated models with cause-effect relationships	13. Applied general equilibrium models with external costs
14. Bounded individual rationality and uncertainty	14. Maximisation of utility or profit
15. Local communities	15. Global market and isolated individuals
16. Environmental ethics	16. Utilitarianism and functionalism

Figure 1: Comparison of ecological and environmental economics (Ecological Economics: Themes, Approaches, and Differences with Environmental Economics, Jeroen C. J. M. Van den Bergh, 2000)

Environmental economics focuses on value dimensions: namely, utility and welfare in theory, and costs and benefits in practice. Unlike neoclassical economics, ecological economy does not regard a total valuation of changes in ecosystems as the sum of private values. For the latter takes no account, or insufficiently, or insufficient account, of internal environmental system functions, “life-support” functions, future generations, and non-instrumental existence values. EE is inclined to add criteria to the economic values in the context of decision making concerning management of and changes in ecosystems.

3. ENVIRONMENTAL TAXES

Environmental pollution is a global problem of our time, and the efforts of all economically developed countries without exception are aimed at combating it. In world practice, there are two main approaches to the regulation of environmental activities: command and control (administrative) and market. The market approach involves primarily the use of financial instruments to stimulate and deter entrepreneurial activity affecting the field of nature management and ecology. The leading place among such instruments belongs to environmental taxes. An environmental tax cannot guarantee a particular environmental impact polluters behavioural responses may be less, or more, than expected. In cases where the precise achievement of an environmental target is a high priority, this may be an important drawback of environmental taxes, and quantity instruments such as emissions trading may be preferred (Fullerton et.al., 2008 pp. 6-8). Environmental taxes began to apply the Scandinavian countries in the 80s. Until the mid-90s. their role in tax revenue grew slowly. In the EU as a whole, the share of such taxes in the aggregate GDP of the member countries increased from 2.6% in 1980 to 2.9% in 1994. A slight increase was observed in 1995-1996. mainly due to the expansion of the membership of the EU. In the OECD countries, which includes most European countries, the tax shift towards environmental taxes — the Green Tax Reform — began in 1995-1996. In many countries with an effective environmental protection mechanism, environmental taxes play a significant role. The experience of the EU and OECD countries shows that environmental taxes, which constitute a large part of the revenue base of the budgets of these countries, are taxes for environmentally hazardous economic activities. In other words, anything that can cause adverse changes in the environment can be subject to environmental taxation.

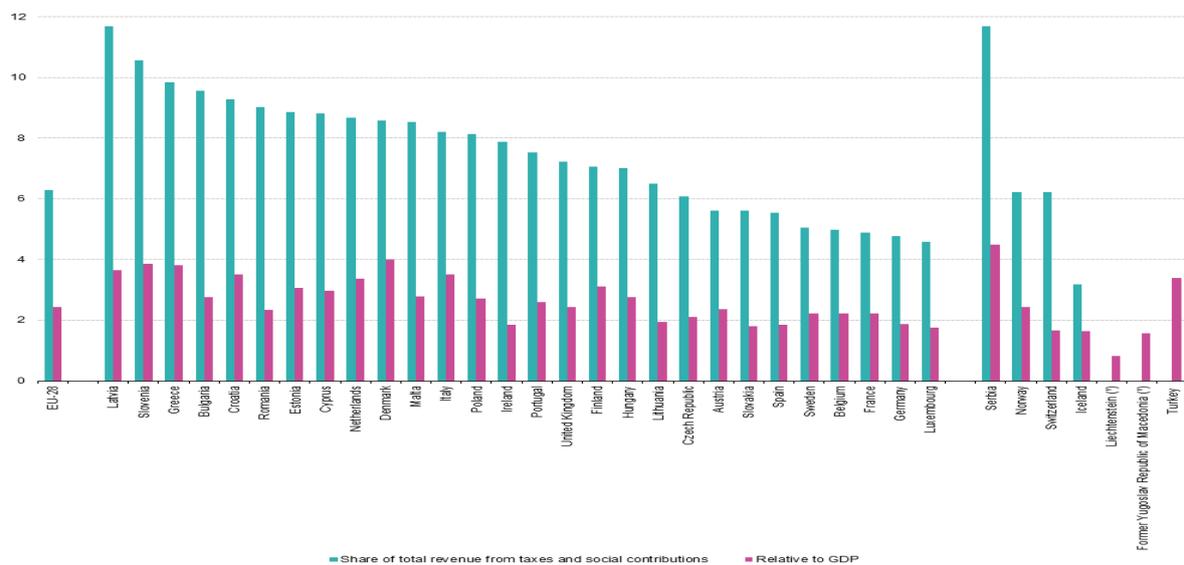

Taking this definition as a basis, the European Commission's Tax and Customs Directorate has divided environmental taxes into seven groups by application:

- energy taxes: motor fuel; energy fuel; for electricity.
- transport taxes: taxes on kilometers traveled; annual tax on the owner; excise taxes when buying a new or used car.
- pollution charges (tax on emissions): emissions of pollutants into the atmosphere; emissions to water basins; emissions of carbon dioxide and other harmful substances (chlorofluorocarbons, oxides of sulfur and nitrogen, lead); emissions of substances causing global environmental changes (such as damage to the ozone layer).
- payments for waste disposal (tax on waste). These include payments for the disposal of waste in landfills and their recycling and taxes on a number of special products (packaging, batteries, tires, lubricants, etc.).
- noise impact tax (earmarked charges).
- payments for the use of natural resources (royalty).

	million EUR	% of total environmental taxes	% of GDP	% of total revenues from taxes and social contributions
Total environmental taxes	364 398	100,0	2,4	6,3
Energy taxes	280 354	76,9	1,9	4,8
Transport taxes	71 747	19,7	0,5	1,2
Taxes on pollution and resources	12 297	3,4	0,1	0,2

Figure 2: Total environmental tax revenue by type of tax, EU-28, 2016 Eurostat

In 2016, the total income from environmental taxes in the EU-28 (that is, income from environmental taxes collected by governments in all EU member states) was € 364.4 billion; this figure represents 2.4% of the gross domestic product (GDP) of the EU-28 and 6.3% of all government revenues from taxes and social contributions to the EU.

(*) 2015 instead of 2016.

Figure 3: Total environmental tax revenue, 2016 Source: Eurostat

Figure 3 shows the revenues of environmental taxes in 2016 by countries, both in terms of GDP, and in terms of total government revenues from taxes and social contributions. Regarding GDP, the highest level of revenues from environmental taxes was recorded in 2016 in Denmark

(4.0%), followed by Slovenia (3.9%), Greece (3.8%), Latvia (3.7%), Croatia and Italy (both 3.5%). The lowest revenues from environmental taxes in relation to the country's GDP (below 2%) were recorded in six EU member states (Lithuania, Germany, Spain, Ireland, Slovakia and Luxembourg). Serbia stands out for its environmental tax revenue in 2016 at 4.5%, followed by Turkey (3.4%). Of the EFTA countries, Norway in 2016 recorded the highest level of tax revenues relative to GDP (2.4%). For Switzerland and Iceland, revenues from environmental taxes in 2016 amounted to 1.7% and 1.6% of GDP. The share of environmental taxes in total government revenues from taxes and social contributions also varied considerably across EU member states. Latvia had the largest share in the EU (11.7%), slightly ahead of Slovenia (10.6%). Four other EU member states have a share of at least 9%: Greece (9.8%), Bulgaria (9.6%), Croatia (9.3%) and Romania (9.0%). At the opposite end of the scale, the lowest shares of environmental taxes are Luxembourg (4.6%), Germany (4.8%), France (4.9%), Belgium (5.0%) and Sweden (5.1%), followed by Spain (5.5%).), Slovakia and Austria (both 5.6%). The share of environmental taxes in total government revenues from taxes and social contributions registered by Serbia (11.7%) was at the same level as in Latvia, the country with the largest share in the EU. Environmental tax revenues collected in 2016 in Norway and Switzerland accounted for 6.2% of total government revenues from taxes and social contributions, while for Iceland the equivalent share was relatively low (3.2%).

4. CONCLUSION

An important direction in improving nature conservation and the use of natural resources is the determination of an adequate price or economic assessment of natural resources and natural services. The environment provides three functions:

- the provision of natural resources;
- the assimilation of waste and pollution;
- providing people with natural services, such as recreation, aesthetic pleasure, etc.

These three functions can also be represented as components of one general function of the natural environment - life support functions. Real prices of natural resources can be effective levers in the market mechanism. With irrational environmental management at enterprises, their accounting will lead to a deterioration in production indicators, which will affect financial results. Accounting prices of resource estimates will allow more reasonably determine the cost-effectiveness of development alternatives. The use of estimates can significantly affect the choice of capital construction options. For example, taking into account the fact that land resources planned for withdrawal can be used in agriculture and produce, it may make expedient to change investment projects in the direction of higher prices for the construction object itself due to its maximum concentration, additional costs for attracting uncomfortable land. Inadequate assessment of natural resources leads to underestimation of the effects of greening the economy, the transition to sustainable resource-saving development. The annual losses of oil, timber, various minerals of degraded land, etc. can be estimated at many billions of dollars. One of the important reasons for the loss of natural resources and the increase in the environmental intensity of the economy was the deterioration of equipment exceeding all acceptable standards. In the conditions of continuing operation of such equipment, the probability of environmental disasters sharply increases. Now the UN, developed countries are trying to "green" measurement of the main economic indicators, taking into account the environmental factor. In particular. The United Nations Statistics Division proposes a system of integrated environmental and economic accounts aimed at taking environmental factors into account in national statisticians. Also of interest are the following indicators: the human development index proposed by the UN and the sustainable economic well-being index proposed by G. Dali and J. Cobb.

The first one is an aggregate indicator calculated on the basis of the characteristics of life expectancy, level of knowledge and level of mastering the resources necessary for normal life. The second is a fairly comprehensive indicator that takes into account the costs of an environmental nature associated with inefficient management. However, the exit of the economy to the path of sustainable development is impossible only through market mechanisms. The market model, as already shown above, cannot lead to the path of sustainable ecological and economic development of the economy. The market failures are obvious in this case. An important quality of the market is that it makes it possible to ensure the best use of various resources due to price signals of their scarcity. But the real social costs and benefits of the use of environmental resources through the prices of resources emerging on "environmental" markets, it is impossible to calculate. As a result, there is an inadequate assessment of scarce resources, supply and demand quantities, which gives underestimated incentives for the efficient use of natural resources and environmental protection. The reasons for market failures in the environmental field are such as

- externalities (external effects);
- the absence (undervaluation) of prices for natural goods and the absence of such markets;
- public goods;
- transaction costs;
- property rights;
- uncertainty and short-sightedness.

As for externalities, they cannot be adequately taken into account primarily in terms of the social costs of society from environmental degradation. Therefore, the understated prices of natural goods are obvious. Transaction costs can also be quite large in relation to the expected benefits (costs associated with obtaining information, conducting multilateral negotiations, ensuring compliance with negotiations, etc.) And, even if an agreement is reached, the degradation of nature still continues. The market system is not interested in producing public goods, since their features are opposed to the characteristics of individual consumer goods. These large units are indivisible and the principles of exclusion do not apply to them. The benefits of public goods come to society as a result of the production of such goods. A significant problem for the market is uncertainty and short-sightedness. By its nature, the market is focused on getting quick results, profits and does not take into account long-term damages and benefits. Market failures in the economic sphere show that purely market regulators in the use of nature are ineffective. At the same time, the inefficiency of state regulators in solving environmental problems is obvious. Among the examples of ineffective public policy are the following:

- subsidies (for pesticides, energy, irrigation water, etc.);
- tax system (stimulation of environmental activities in agriculture, energy, etc.);
- price control;
- environmentally destabilizing foreign trade policy;
- inconsistent reform of property rights;
- deficiencies in environmental management and monitoring, and so on.

In society, there is a dispute about subsidies, in particular, for electricity. They need to be resorted to because of the distortion of prices for this product. The removal of subsidies will force everyone to save energy and reduce local air pollution, reduce carbon emissions in some countries by 20%, and globally by 7%. Despite the shortcomings, the role of the state in environmental protection is great now and will grow in the future. The experience of developed countries over the past two or three decades shows that the role of the state is important in

setting different standards and standards in the field of environmental protection. He plays a leading role in the implementation of alternative solutions to environmental problems, economic restructuring and others. Today, in many countries in the field of environmental protection, a kind of symbiosis of administrative and market mechanisms has developed. And the search for optimal environmental and economic regulators continues. There is no ready and well-established model of the economic mechanism of interaction between society and nature in the world, but there is an obvious need to balance state and market approaches depending on the ecological situation, characteristics of the economy, etc. As already noted, the greening of the economy for our country, the transition to a sustainable type of economic development is complicated by a structural crisis. Institutional inefficiency (protection of property rights, privatization, incorporation, etc.) only aggravates the situation. This does not mean that it is necessary to slow down the progress towards new forms of management. However, everything new needs to be weighed on an ecological scale; any decisions in the economy, including institutional ones, must begin with the creation of a system of strict environmental protection or an assessment of how a particular decision will affect nature. If today enterprises (in the face of fierce competition, bankruptcies and a constant lack of financial resources) tend to sacrifice primarily nature, then they can be understood. Under these conditions, the role of the state in ensuring the environmental safety of the country increases (preserving the health of the nation and ensuring sustainable socio-economic development with the adequacy of the environmental conditions).

THE CURRENT STATE OF THE AZERBAIJAN REPUBLIC BUDGET POLICY AND THE PROSPECT OF ITS IMPROVEMENT

Rauf Gushkhani

*PhD, Associate professor at Department of Economics,
Azerbaijan State University of Economics, Baku
rauf.kafedra@mail.ru*

ABSTRACT

The state budget policy is determined by the Constitution of the Republic of Azerbaijan, the Law of the Republic of Azerbaijan on the budget system, as well as other legislative acts defining the functions and responsibilities of various authorities in the budget process. The basis of the budget policy is the strategic directions of economy and social policy of the state; it is they who determine the size and proportions of financial resources centralized by the state, the prospects for using budgetary funds in the interests of solving major savings, and social tasks. In the market conditions of fiscal policy - the main lever for determining the main directions of economy, the impact of the state on social production.

Keywords: budget policy, state budget, Strategic Roadmap, taxes

1. INTRODUCTION

Budget policy is the impact on aggregate demand through a system of government orders, taxation and transfer payments:[1] The state budget, being the main means of mobilizing and spending state resources, gives political power a real opportunity to influence the economy, finance its structural adjustment, stimulate the development of priority sectors of the economy, and provide social support to the least protected segments of the population. The basis of the budget policy is the strategic directions of economy and social policy of the state; it is they who determine the size and proportions of financial resources centralized by the state, the prospects for using budgetary funds in the interests of solving major savings, and social tasks. In the market conditions of fiscal policy - the main lever for determining the main directions of economy, the impact of the state on social production.

2. FORMATION OF STATE BUDGET

Budget revenues are generated from taxes (TA), and expenses are purchases of goods and services and transfer payments (G + TR) in this case, the budget surplus (BS) will be equal to:

$$BS = TA - G - TR$$

Positive budget surplus is called a budget surplus, a negative one is called a budget deficit. If we take into account that $TA = tY$, where t is the tax rate, Y is the income level, then we get the following equation $BS = tY - G - TR$. This shows that the budget surplus depends on the tax rate, the volume of government purchases, the size of transfers and all the factors that change the level of income. Therefore, during periods of economic recession, when there is a decrease in tax revenues and, as a rule, an increase in transfer payments, the problems of the budget deficit are exacerbated. Sources of financing the budget deficit are:

- internal sources of the following types: loans received from credit institutions in foreign currency; government loans made by issuing securities on behalf of the Republic of Azerbaijan; budget loans received from the state budget;
- external sources of the following types: government loans in foreign currency through the issuance of securities on behalf of the Republic of Azerbaijan; loans from foreign

governments, banks and firms, international financial organizations provided in foreign currency and financial resources from the privatization of state property.

Theoretically, government spending and revenues should be equal. But since they represent different aspects of the state's activities, depend on different factors, solve different tasks, affect income and employment differently, characterize different relationships qualitatively, in practice this causes some imbalance. Therefore, in reality, the revenues and expenditures of the state may not be equal. Moreover, the difference between the sum of government revenues and government spending is used as a tool of fiscal policy, i.e. can stabilize or stimulate the economy of the country. There is no close interdependence between expenditures and state revenues, since they are not connected with the purchase and sale of those services that are performed by the state. For firms, the interdependence of income and expenses is quite obvious. It acquires resources, produces any goods from them, sells them and, with the money received, acquires material resources in order to start the cycle anew. At the same time, both the costs and the income of the company increase the GDP and employment. For the activities of the state, this dependence is not typical. The public goods that the state produces are not mediated by money. Taxes directly reduce revenues and output, raise prices. And only government spending increases output, employment, and income. The budget is usually considered as a law, because minor fluctuations in government spending can lead to destabilization of the economy as a whole through a government spending multiplier, breaking certainty in the economic activities of economic agents. The destabilization of the economy, the violation of the certainty of its development deprives both the state and economic agents of the future. In such conditions, not long-term economic development tasks come to the fore, but short-term (in the sense of survival), so we can say that the practice of restructuring the budget in the middle of the next financial year means the absence of the state's strategic and long-term goals in economic development. This kind of state policy, based on the absence of strategic goals, affects the entire society, since under conditions of uncertainty and instability, a periodic depreciation of financial and physical assets (property) of economic agents, they cannot have long-term goals. Short-term tasks, such as income and current consumption, including calculations, payments, look strategic. State expenses, depending on their economic content, are divided into current expenses and capital expenditures. Capital expenditures of the state is a part of the costs that provides innovation and investment activities, expenses in the exercise of which property is created or increased and other expenses. Current state expenditures are a part of expenditures that ensures the current functioning of government bodies, the provision of state support to other budgets and individual sectors of the economy in the form of subsidies, subsidies and subventions for current funding and other expenditures. Government spending and the equilibrium net national product (NNP): there are two approaches to their consideration - from the standpoint of analyzing the flow of total expenditure and national output and from the standpoint of analyzing the flow of leakage and injection. The first approach is as follows: total expenses are equal $C + I + X_n + G$, i.e. as the G component increases in them, their graph shifts upwards, which leads to an increase in the NNP. The second approach assumes that government spending complements private investment and net export spending ($I + X_n + G$), and, increasing, cause an increase in the equilibrium NNP. Or else, as a result of the diversion of savings and imports, the consumption of the domestic product falls below the level of domestic income after taxes, creating a gap in spending. This gap can be covered by injections of investments, exports or government procurement. If there are no taxes, $TA = 0$, the equilibrium NNP is determined at the intersection of the graphs $(S + M) = (I + X_n + G)$, where S is the household savings, M is import.

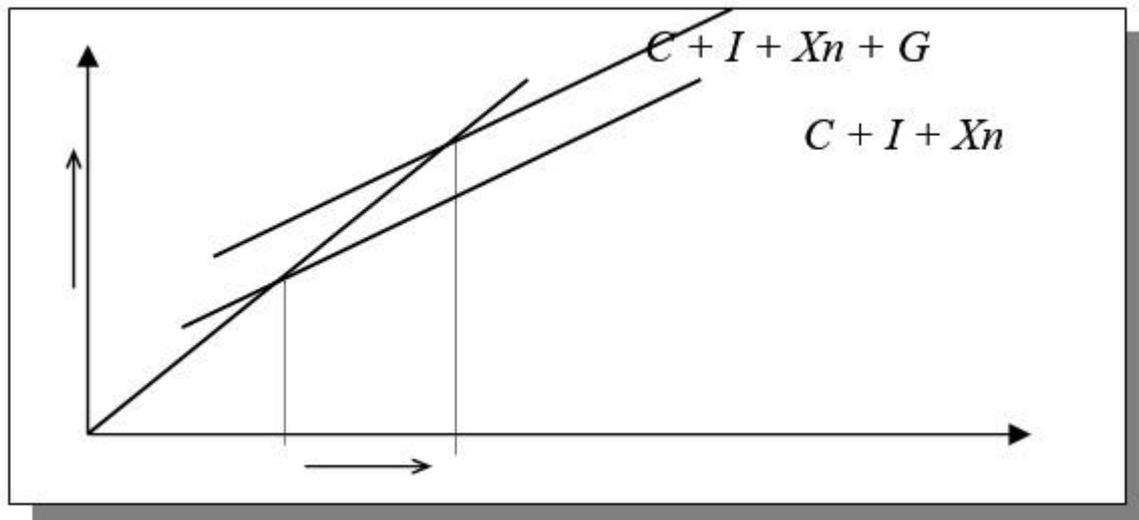

Figure 1: Government spending and equilibrium NNP: from the standpoint of analyzing aggregate expenditure flows and national output.

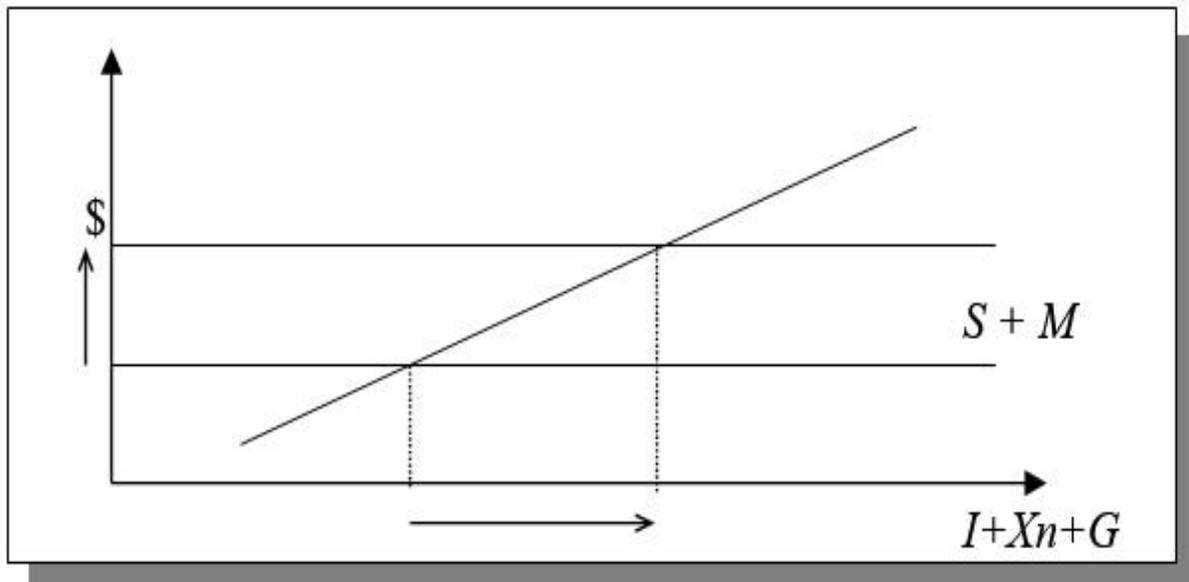

Figure 2: Government spending and equilibrium NNP: in terms of leakage flow analysis.

Both approaches draw identical conclusions: the increase in the public expenditures leads to growth of size of equilibrium ChNP. In turn, reduction of size of the public expenditures will cause shift down of the schedule of cumulative expenses or the schedule $(I + X_n + G)$ of that reduction of equilibrium ChNP will be result. Income of the state is formed at the expense of tax and non-tax types of income, and also due to gratuitous transfers. Besides, balance for the end of previous year is enlisted in the income of the state of the current year. The state and local taxes and fees, and also penalty fee and penalties provided by the tax law belong to the tax income. Treat the non-tax income: the income from use of the property which is in the state or municipal ownership; the income from sale or other paid alienation of the property which is in the state or municipal ownership; the income from the paid services rendered by appropriate authorities of the government, local governments, and also the budgetary institutions; the means received as a result of application of civil, administrative and criminal liability, including penalties, confiscations, compensations, and also the means received in indemnification: [1] As for the tax income, their size depends on two factors: tax rate and size ChNP.

From here the following conclusions follow:

1. It means that the more ChNP, the less tax component of ChNP, i.e. at high ChNP and a small tax rate the state can collect very heavy taxes in absolute expression.
2. The ChNP less, the more there has to be a tax rate.

State revenues (taxes) and equilibrium ChNP: for their consideration the same approaches, as for consideration of the public expenditures and equilibrium ChNP, i.e. consideration from positions of the analysis of cumulative expenses and national release and consideration from positions of the analysis of streams of leaks and injections are used. The first approach, using definition of cumulative expenses as $C + I + X_n + G$, considers that fact that at increase in taxes consumption of C decreases to some size of S_a . I.e. there is a decrease in the schedule of cumulative expenses down, and it leads to decrease in equilibrium ChNP.

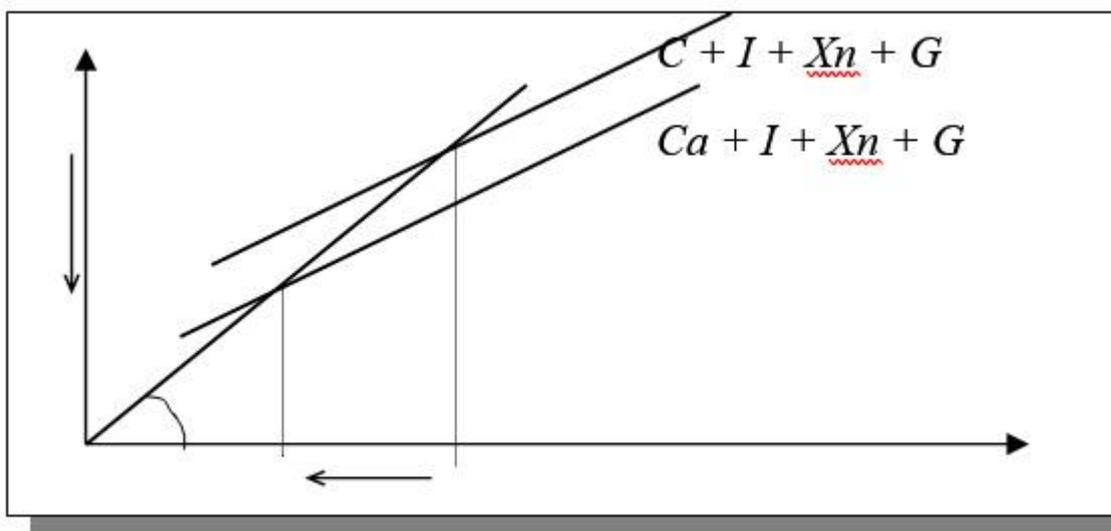

Figure 3: Government revenues and equilibrium NNP: from the standpoint of analyzing the flow of total expenditures and national output.

The second approach assumes dual influence of taxes. First, taxes conduct to reduction of the income after payment of taxes and to decrease in savings from size S up to the size S_a . Secondly, taxes as those, it is additional leak from system at each ChNP level, and have to be added to S_a + by M , giving $S_a + M$ + T . All this leads to shift of schedules, and finally we receive reduction of equilibrium ChNP.

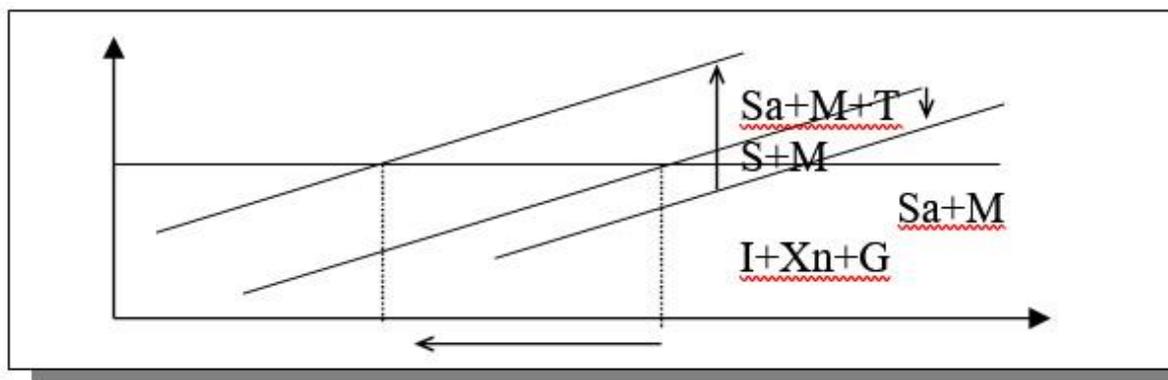

Figure 4: State revenues and equilibrium ChNP: from positions of the analysis of streams of leaks.

The conclusion at both approaches is identical: the increase in taxes leads to decrease in equilibrium ChNP. In case of decrease in taxes there is a movement of the schedule of cumulative expenses or decrease in level of the schedule of $S_a + M + T$ up. Growth of size of equilibrium ChNP will be result anyway. I would also like to say about the mechanism called in the Western economic literature the Oliver-Tanzi effect". Its essence consists that the government isn't able to collect taxes instantly. Between the moment of implementation of economic activity, taxable, and the time log is always available the moment of payment of a tax. This situation doesn't depend on character of a tax (on profit, a value added tax, on the income). As a result, the government is compelled to pay the operating costs for the current prices though these expenses are financed by the taxes created on the basis of the prices of the previous period. If rate of inflation doesn't exceed several percent a year, compensation of this effect and maintenance of the balanced budget by means of little change of tax rates is quite real. If rate of inflation is estimated in tens or hundreds of percent a year, similar compensation is impossible because further increase of tax rates doesn't increase it, and on the contrary, reduces.

3. COMPOSITION OF BUDGET POLICY

The budgetary policy can't be effective if its main directions for the next period and prospect are accurately not defined, main goals and priorities aren't formulated. Thus, validity of the put-forward measures and the forthcoming decisions has to be supported with the corresponding calculations allowing to define not only a total cost of expenses of the state in connection with the made decisions, but also the remote financial consequences. Components of the budgetary policy are:

- fiscal, or tax policy;
- investment policy.

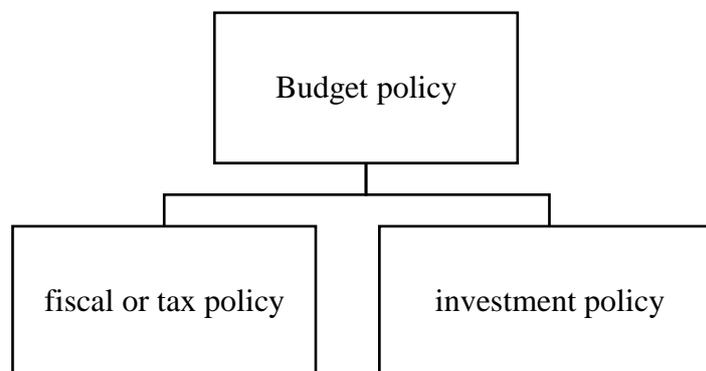

Figure 5: Budgetary policy.

In fiscal, or tax, policy interests of government, businessmen and hired workers that assumes a choice of this or that fiscal course, the principles of a tax policy face. Among the last the greatest fame was gained:

- the maximum taxation of the received and available vital values of subjects;
- taxation according to solvency of economic subjects;
- taxation according to mutual benefit of payers and the state;
- the principle of a donation from economic subjects.

The choice and ratio of the principles in concrete practice of the taxation substantially are defined by character of a state system, specifics of the historical moment and other factors. So, the first two principals were widely used by the totalitarian modes when interests of the ruling

state clique supported by power structures were put on the first place. After all the more taxes, the share of an internal product at the state is higher, it is more powerful and stronger than subjects. To the contrary, the last principles (mutual benefit and a donation) characterize a democratic system when citizens of the country through electoral system of government dictate a course and the course of fiscal policy.

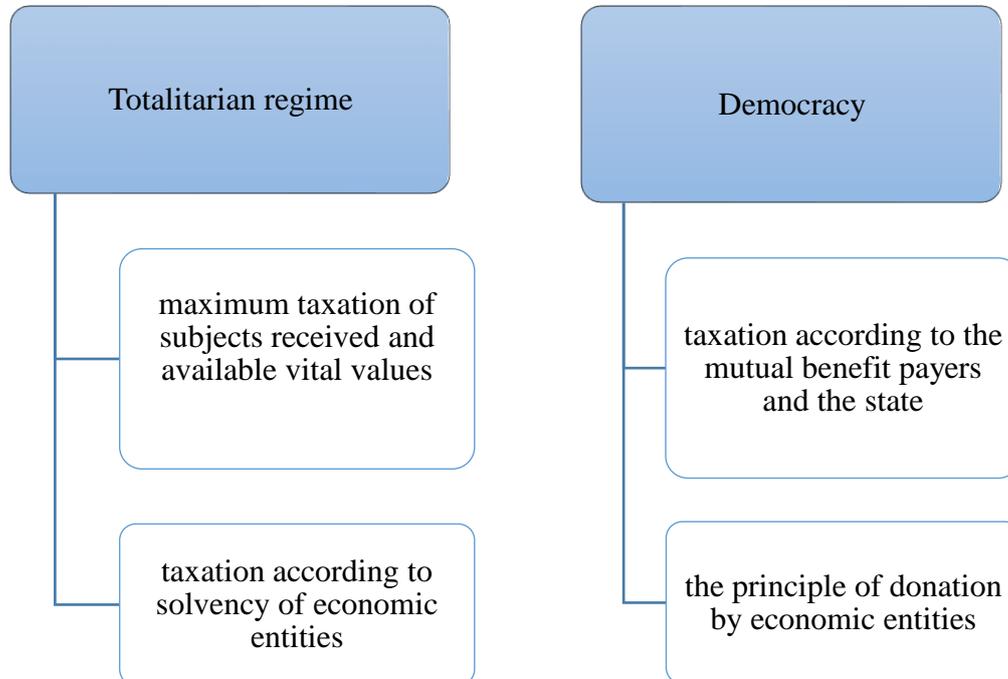

Figure 6: The ratio of the principles of taxation depending on the government

There is a classical objective situation: any choice of the principles has to guarantee a minimum of the vital benefits for existence and reproduction of labor as only real source of wealth, base of society and state.

The investment policy covers a big complex of problems among which the main are:

- the ratio of realization of inquiries of consumers and producers which is reflected in a proportion of the current investments and investments of development;
- ratio of interests of various subjects' consumers, definition of proportions of allocations for financial security of the maintenance of government, poor population, economically well-founded layers, etc.;
- providing a living wage to citizens of the country.

Such is the general maintenance of the budgetary policy. Its value is huge because the economic, financial basis of functioning of the state and activity of all society is defined by it. For ensuring social protection the budgetary policy has to be carried out in the following directions:

- the budgetary forecasts from the economic point of view have to be completely proved, real opportunities of tax collecting have to be correctly estimated;
- it is correct to balance the income and expenses of the budget;
- ensuring growth of revenues of the budget by achievement of economic development in not oil sector;
- to perform necessary works on decrease in tax debts;
- improvement of the tax law for the purpose of strengthening of tax control, hindrance of evasion of taxes and expansion of tax base;

- for expansion of tax base and hindrance of evasion of taxes to apply the simplified taxation only on the relation of some kinds of activity;
- achievement of increase in receipts from privatization due to acceleration of privatization of the state property;
- achievement of lawful definition of releases from a value added tax to destination;
- increase in expenses of funds from the budget for social protection and social security, health care, education, science, construction and other socially directed purposes;
- further work on improvement of structure of deficiency of the state budget;
- financing of budget deficit at the expense of the sources which aren't creating inflation;
- achievement of development of securities market for issue of short, average and long-term bonds, expansions of a network of investment for the purpose of rational attraction of excessive money supply in the address, regulations of interest rates, increasing requirement to these papers, on the basis of the normal competitive principles.

The budgetary policy of the state is defined by the Constitution of the Azerbaijan Republic, the Law of the Azerbaijan Republic "About the budgetary system", and also other acts defining functions and obligations of various authorities in the field of the budgetary process. You shouldn't carry the budgetary policy only to the budgetary process. The law about the budgetary policy precisely defines functions of authorities in the budgetary process. The budgetary policy has the subjects and object. As subjects the government legislative and executive bodies of the power developing, claiming, controlling and executing the accepted budgetary policy, and also direct performers of budgets of all levels of the power act. Most often the budgetary tax law, the budgetary system and the budgetary mechanism understand as object of the budgetary policy in various combinations. However, some authors consider as more correct to recognize all budgetary process including the budgetary and tax right, the budgetary system, system of budgets and the budgetary mechanism as object of the budgetary policy. Each of these elements has to carry out the functions and tasks within the accepted budgetary policy: [1]

The budgetary policy has to be under construction on the following principles:

- the principle of objectivity - reflection in the budgetary policy of the objective processes happening in economy;
- the principle of continuity - formation of the budgetary policy the forthcoming fiscal year taking into account tasks and achievements of the previous period;
- the principle of obligation - the budgetary policy has to be obligatory for execution;
- the principle of publicity - openness, transparency and a submission to control of the budgetary relations at all stages of the budgetary process.

The budgetary policy can be divided into types and forms of realization.

1. On scale and long duration of the purposes and tasks distinguish strategic long-term (of 3 and more years) and tactical budgetary policy;
2. Depending on priorities of the budgetary policy allocate the following types:
 - the profitable type is characterized by that planning, execution and the organization of budgets are conducted from the income, under their volume the budgetary expenses and the main objectives are arranged.
 - the account type is based on submission of the income of the budget to its expenses.
 - the control regulating type. Characteristic features of this kind of policy is excessive regulation of economy, the state orders, tax privileges, expansion of state ownership on the fields of activity which are traditionally occupied by the private sector.

- the combined type is aimed at providing an equilibrium ratio of all functions of the budget, interests of the state, taxpayers, users by the state services and societies in general. Between these types of the budgetary policy it is difficult to draw a clear boundary. In practice the budgetary policy pursued by the state carries combined, but not always equilibrium character.
3. Depending on a strategic orientation of the budgetary regulation distinguish the stimulating and constraining budgetary policy.
 4. On a territorial sign it is possible to allocate the state and local budgetary policy.
 5. On the basis of subject specialization, it is possible to allocate tax, social, investment and other types of the budgetary policy.

In the budgetary message of the President of the Azerbaijan Republic for the next fiscal year the budgetary policy of the Azerbaijan Republic is defined. At the local level this policy is defined by decisions of appropriate authorities. This policy is carried out by activity of financial and tax authority (the Ministry of Finance of the Azerbaijan Republic), body regulating monetary - credit policy (the Central Bank of the Azerbaijan Republic), calculating - control body (Audit Chamber of the Azerbaijan Republic). Fiscal year of the Azerbaijan Republic and execution of the budgetary process covers the period in 12 months, from January 1 to December 31. Duration of the budgetary process exceeds fiscal year. As the budgetary process joins the period of carrying out the budgetary forecasting, and then time on implementation of the budgetary control, etc.

4. ACHIEVED RESULTS OF MODERN FINANCIAL POLICY OF AZERBAIJAN

The forecast for the income of the state budget for 2019 makes 23 billion 168 million manats, to expenses - 25 billion 190 million manats. It is offered to increase deficiency of the state budget for 2019 to 2 billion 22 million manats, or 2,5% of GDP. Price of oil in the state budget for 2019 is put of \$60 for barrel (\$55,1 for barrel in the state budget for 2018). Income of the state budget for 2018 is approved of 22 billion 149 million manats, expenses - 23 billion 100 million manats. Deficiency of the state budget is predicted at the level of 951 million manats, or 1,3% of GDP. In November 2018, Parliament of Azerbaijan adopted bills of a living wage and criterion of needs. According to the bill "About a Living Wage in Azerbaijan for 2019", this criterion about the country for the next year is established in 180 manats, for able-bodied population – in 191 manats, for pensioners – in 149 manats, for children – in 160 manats. The living wage for 2018 is established at a rate of 173 manats, for able-bodied population – 183 manats, for pensioners – 144 manats, for children – 154 manats. According to the bill "About Criterion of Needs for 2019", the criterion of needs for purpose of the address social help is established in 143 manats. It should be noted that in 2017 38 percent (6690,8 million manats) of expenses of the state budget of Azerbaijan were social appointment that for 7,3 percent or 453,7 million manats there is more than indicator of 2016. These funds were allocated in fund of compensation, for payment of grants and social benefits, for purchase of medicines and the food. Also, 62,1 percent (10921,1 million manats) of expenses of the state budget fell on the current expenses, 29,3 percent (5153,5 million manats) - capital expenses, 8,6 percent (1513,7 million manats) - expenses in connection with service of a public debt and other obligations. In general, expenses of the state budget of Azerbaijan last year were up to standard 17 588,3 million manats (at execution for 98 percent). Income of the state budget in 2017 made 16516,7 million manats against the forecast in 16 766 million manats that means execution of the forecast for 98,5 percent. In structure of revenues of the state budget of receipt through the ministry of taxes made 6972 million manats that is 8,8 percent less than the forecast. Besides, 74,5 percent (5192,7 million manats) from the budgetary receipts in Ministry of Taxes fell to

the share of not oil sector. Through the State Customs Committee 2 608,8 million manats that is 15,9 percent more than the forecast came to the state budget.

Indicators	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017

Table 1: Receipt of taxes and other payments in the state budget of Azerbaijan for 2008-2017, million manats: [2]

Besides, in 2017 366,1 million manats came to the state budget from the paid services rendered by budgetary organizations, 250 million manats - due to assignments from profit of the Central bank of Azerbaijan, 150 million manats - due to other receipts. Transfers in the budget made 6,1 billion manats that is 19,9 percent less than in a year before last of the State oil fund of Azerbaijan (SOFAZ). Deficiency of the state budget made 1141,4 million manats that for 33,6 million manats below the approved top limit. Financing of deficiency was provided due to sale of the state bonds (384,6 million manats), means from privatization (106,5 million manats) and the rest on the uniform treasury scoring of the state budget in January first, 2017 (650,3 million manats). In 2017 GDP growth of Azerbaijan made 0,1%. The volume of GDP of Azerbaijan in January-October 2018 made nearly 65,2 billion manats that is 0,8 percent more than an indicator of the similar period of last year, follows from the report of the State committee on statistics. GDP volume having per capita made 6648,1 manats. Following the results of the reporting period GDP volume made in not oil sector of Azerbaijan grew by one percent in comparison with January-October 2017, and in oil and gas sector growth by 0,3 percent was observed. For the reporting period, except for construction sector, in all spheres of economy growth was observed. So, the sphere of transport and warehouse economy grew by 8,6 percent, placements of tourists and a public catering - for 7,6 percent, information and communication services - for 8,8 percent, rural, forest and fishery - for five percent, trade and repair of vehicles - 2,6 percent, the industries - for 1,4 percent, other spheres - for 0,3 percent. The sector of construction was reduced by 15,8 percent. In structure of GDP of Azerbaijan 45,7 percent (nearly 29,8 billion manats) are created in the industry sphere, 6,3 percent (4,2 billion manats) - in construction, 5,6 percent (3,66 billion manats) - in rural, forest and fish farms. In 2019 increase of GDP for 3,9 percent, in the next years is predicted – on average for 3,4 percent, and the balance of payments of a current account according to forecasts will be positive.

5. CONSLUSION

For ensuring efficiency of the budgetary policy at its development it is important to observe certain requirements, namely: the scientific approach considering real state of the economy,

financial and budgetary system of the country; definition of its main objectives and tasks, and also the directions for the next period and prospect; validity of the put-forward measures and the forthcoming decisions considering a total cost of expenses of the state and the remote financial consequences. As objective fundamentals of the budgetary policy functions of the budget which are really realized in diverse public and economic life of the country, her subjects act. In research nine functions of budgets - redistributive, reproduction, regulating, stimulating, planned, control, fiscal, international and social are established. Their realization in economic and financial practice significantly affects numerous processes in economy and society. It allows to solve more successfully the problems facing the country. Moreover, from here a conclusion what exactly the budgetary relations form the budgetary policy of the state. They are under construction on interest of citizens and economic entities in receiving from the state of these or those services. The modern budgetary policy of Azerbaijan originates by the beginning of the 90th years when the new approaches which are based on elements of a market mechanism and state regulation of economy began to be used. In its basis - recognition of freedom of business activity, distribution of diverse forms of managing, privatization and privatization of state ownership, and transition to the mixed economy which is based on a skillful combination of private and state economic entities. On this base essentially, new budgetary mechanism is developed. The state refuses the directive management of the intraeconomic relations at the enterprises and transfers their relations with the budget to a tax basis which puts a barrier to any withdrawal of the income. All economic subjects receive uniform rules of distribution of the created budgetary resources to rather long prospect. Thus, research showed that along with the mechanism of formation of the budgetary policy, it is necessary to consider the mechanism of its realization. Both these mechanisms are interconnected, specifically influence at each other. How the mechanism of formation of the budgetary policy in many respects functions, and even a decisive image, efficiency of manifestation of the mechanism of realization of the budgetary policy depends. In turn, from that the last how successfully acts creation of the best conditions and opportunities for improvement of the first depends. Policy in the field of the income of the budget, first of all fiscal or tax, the policy in total with policy in the field of budget expenses, policy in the field of ensuring balance of the budget and effective management of the public (municipal) debt, and also policy in the field of the interbudgetary relations expresses functional aspect of the budgetary policy. Research showed that in public practice, including economy, during the forming and realization of the budgetary policy both the budgetary strategy, and the budgetary tactics, and various links of functional budgetary policy are applied. The solution of the main problems of the interbudgetary relations at the state level which is possible, first of all, and on the basis of more effective budgetary policy, is expressed in the following:

- in Azerbaijan the highest centralization of the tax and budgetary powers formally remains (despite rather noticeable financial decentralization) that demands significant measures for its decrease;
- to continue improvement of legislative fixing of methodology of the budgetary alignment on the basis of further specification of criteria and procedures, despite the available tendency of formalization of distribution of financial aid;
- to create the atmosphere reducing the overestimated social expectations and requirements to the budgetary security state and municipalities that will allow to overcome a contradiction between decentralization of the budgetary resources and formal centralization of the tax and budgetary powers;
- to increase transparency of the state and local budgets, to introduce complete system of monitoring of a state and quality of management of the public and municipal finances which results would be available not only to authorities of different levels, but also the population, investors and creditors.

The specified analysis confirms that the budgetary policy of the Azerbaijan Republic of the national economy of Azerbaijan developed on the basis of the Strategic road map is scientifically based and almost proved state document.

ABSTRACT

Budget is the basic instrument used to fund public needs. The subject-matter of the research presented in this paper are expenditures for acquisition of non-financial assets within budget expenditures and expenses at the level of all units of local and regional self-government in the Republic of Croatia. Budget is adopted at the beginning of the year. Within it, effecting of expenditures is planned based on the available budget revenue. Expenditures for different types of assets (buildings, equipment, etc.) are presented within expenditures effected. Investment in certain types of assets is necessary in order to meet the prerequisites for better living conditions in a particular area. The size of such investment is under constant review. The aim of this paper is to research the effecting and share of expenditures for acquisition of non-financial assets within expenditures and expenses of the units of local and regional self-government and to make conclusions on their significance. Audit procedures that are conducted with the aim of a more cost-effective use of the available funds are discussed. The data of the Ministry of Finance, which is available at its webpages relating to budget execution at individual levels of government, as well as data collected from scientific literature were used in this paper. The paper confirms the hypothesis that the share of expenditures for acquisition of non-financial assets within total expenditures effected in particular units is significantly smaller than the share of operating expenditures. The above is analysed at individual levels of government and in particular at the county level. It is concluded that in total, at the level of all counties and the City of Zagreb, the share of expenditures for acquisition of non-financial assets has decreased; however, at the municipality level, the share of such expenditures has increased. In the absolute amount, expenditures for acquisition of non-financial assets are highest at the town level. At the level of individual counties, the shares of expenditures for acquisition of non-financial assets within the total expenditures and expenses effected are different, depending on budgetary constraints.

1. INTRODUCTION

Budget is adopted by the representative body of a unit of local and regional self-government. Expenditures and expenses are planned based on the budget revenue determined for one calendar year. Constant monitoring of budget revenue realization is necessary in order for the planned expenditures to be effected with the planned frequency. Expenditures are divided into operating expenditures, expenditures for acquisition of non-financial assets and expenses for financial assets and loan repayment.

Within this paper, research was conducted concerning the size and share of expenditures for acquisition of non-financial assets within expenditures and expenses of the units of local and regional self-government and conclusions were made concerning effecting thereof depending on the budgetary constraints. The hypothesis is that expenditures effected for acquisition of non-financial assets significantly differ according to the levels of government (counties, towns and municipalities) and that effecting thereof significantly differs in each of the counties, but that share thereof within total expenditures effected is significantly smaller than the share of operating expenditures.

2. EXPENDITURES AND EXPENSES

When discussing expenditures and expenses, it is necessary to define what is meant by the terms 'expenditure' and 'expenditure for acquisition of non-financial assets'. The provisions of Article 20 of the Ordinance on Budgetary Accounting and Chart of Accounts (Official Gazette 124/14, 115/15, 87/16 and 3/18) define expenditures as decreases of economic benefits in the form of a reduction of assets or an increase of liabilities and expenses as outflows of cash and cash equivalents on all bases. Expenditures are generally divided into operating expenditures and expenditures for acquisition of non-financial assets. Operating expenditures are further divided into personnel expenditures, material expenditures, financial expenditures, subsidies, foreign aid and general budget support, benefits and other expenditures. Expenditures for acquisition of non-financial assets are divided according to the type of acquired non-financial assets (land, mineral resources, patents, concessions, licenses, buildings, equipment, vehicles, books, inventories, additional investments). Budget expenditures and expenses effected may be analysed at the state and local levels, i.e. according to the level of funding public needs. The aim of this paper is to determine the size and significance of expenditures for acquisition of non-financial assets within budget expenditures and expenses of units of local and regional self-government, as well as changes thereof in the period between 2015 and 2017. Likewise, the legal basis for effecting expenditures for acquisition of non-financial assets is examined. Expenditures for acquisition of non-financial assets and the size thereof within total expenditures and expenses effected are examined and presented based on the type of expenditures and expenses (Table 1 and Table 2). Expenditures for acquisition of non-financial assets are examined according to effecting thereof and according to the type of local unit, which includes effecting of expenditures at the level of all counties, at the town level and at the municipality level (Table 3 and Table 4). The third thing that is presented in this paper is the expenditures effected for acquisition of non-financial assets within total expenditures effected for each of the counties (Table 5). Based on the data collected, calculation of shares of expenditures for acquisition of non-financial assets were made and indices were calculated. A comparison was made of the data so obtained and a conclusion was made in regard to their significance.

2.1. Total expenditures and expenses effected

This section will provide an overview of total expenditures and expenses effected at the level of all counties and the City of Zagreb. Total expenditures and expenses were analysed according to individual types, i.e. depending on how much of the budget funds was spent on operating expenditures, how much was spent on expenditures for acquisition of non-financial assets, and how much was spent on financial assets and loan repayments. Table 1 provides an overview of expenditures and expenses effected in all counties and the City of Zagreb in the period between 2015 and 2017, according to the type of expenditures and expenses and containing expenditures for acquisition of non-financial assets. The absolute amount of total expenditures and expenses per county increased in almost all counties in 2017 in comparison with 2016 and also in comparison with 2015. Operating expenditures have the most significant share within total

expenditures and expenses effected in 2017 (81.87%), followed by expenditures for acquisition of non-financial assets (13.91%) and expenses for financial assets and loan repayments (4.22%). In the absolute amount, all expenditures had a tendency to increase in 2017 in comparison with 2015, as well as in 2016 in comparison with 2015, apart from the expenditures for acquisition of non-financial assets, which decreased in 2017 in comparison with 2016. Effecting of expenditures for acquisition of non-financial assets is analysed below.

Table 1: Expenditures and expenses effected in all counties and the City of Zagreb, 2015 – 2017, according to the types of expenditures and expenses (in HRK). Source: author, according to the data of the Ministry of Finance available at <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>

No.	Expenditures	2015	2016	2017	Share 2017
1	2	3	4	5	6
1	Operating expenditures	18,974,743,520	19,467,401,065	20,494,497,247	81.87
2	Expenditures for acquisition of non-financial assets	2,812,074,069	3,519,061,292	3,482,875,265	13.91
3	Expenses for financial assets and loan repayments	972,379,314	1,017,888,586	1,059,616,789	4.22
TOTAL		22,759,196,903	24,004,350,943	25,036,989,301	100

2.1.1. Expenditures for acquisition of non-financial assets

Expenditures for acquisition of non-produced non-current assets, acquisition of produced non-current assets, acquisition of precious metals and other stores of value, acquisition of produced current assets and additional investments in non-financial assets are recorded within expenditures for acquisition of non-financial assets. Table 2 presents an overview of total expenditures and expenses effected and of expenditures for acquisition of non-financial assets according to effecting at the level of all counties and the City of Zagreb, at the county level, at the level of towns and municipalities combined, and individually at the town level and at the municipality level. In regard to the listed data, it is necessary to note the information related to the territorial division of the Republic of Croatia which pertains to the number of local units. The territory of the Republic of Croatia is divided into 20 counties as units of regional self-government, into towns and municipalities as units of local self-government (there is a total of 126 towns and 428 municipalities), and into the City of Zagreb, which has special status as both city and county. This means that there is a total of 555 units of local self-government and a total of 576 units of local and regional self-government (Act on the Territories of Counties, Towns and Municipalities in the Republic of Croatia, Official Gazette 86/06).

Table following on the next page

Table 2: Expenditures and expenses effected in all counties and the City of Zagreb, 2015 – 2017 and expenditures for acquisition of non-financial assets (in HRK). Source: author, according to the data of the Ministry of Finance available at <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>

No.	Expenditures	2015	2016	2017
1	2	3	4	5
1	Total all counties and City of Zagreb (20 counties + City of Zagreb)	22,759,196,903	24,004,350,943	25,036,989,301
1.1	Expenditures for acquisition of non-financial assets	2,812,074,069	3,519,061,292	3,482,875,265
2	Total expenditures and expenses – COUNTIES (20 counties)	3,769,173,005	3,763,387,771	4,042,057,507
2.1	Expenditures for acquisition of non-financial assets	246,599,908	232,128,303	165,466,185
3	Total expenditures and expenses - TOWNS AND MUNICIPALITIES (554 towns and municipalities)	18,990,023,898	20,240,963,172	20,994,931,794
3.1	Expenditures for acquisition of non-financial assets	2,565,474,161	3,286,932,989	3,317,409,080
4	Total expenditures and expenses – TOWNS (126 towns)	15,167,749,172	16,281,722,950	16,821,168,494
4.1	Expenditures for acquisition of non-financial assets	1,623,637,780	2,264,490,555	2,207,487,457
5	Total expenditures and expenses - MUNICIPALITIES (428 municipalities)	3,822,274,726	3,959,240,222	4,173,763,300
5.1	Expenditures for acquisition of non-financial assets	941,836,381	1,022,442,434	1,109,921,623

A different number of towns and municipalities is found in the territory of each county. Expenditures and expenses of local units are related to performing activities pertaining to self-government, which activities relate to development of settlements and housing, physical and urban planning, utilities, childcare, welfare, primary healthcare, primary education, culture, physical education and sports, consumer protection, protection and improvement of the environment, fire protection and civil protection, traffic in their territory and other activities in accordance with special legislation (Article 19 of the Act on Local and Regional Self-Government). Table 3 shows a decrease in the share of expenditures for acquisition of non-financial assets at the level of all counties and the City of Zagreb (the share was 13.91% in 2017, 14.66% in 2016 and 12.36% in 2015). At the county level, the share of expenditures for acquisition of non-financial assets also saw a decrease (the share was 4.09 % in 2017, 6.17% in 2016 and 6.54% in 2015).

2	Total expenditures and expenses – COUNTIES (20 counties)	100	100	100	99.85	107.24
2.1	Expenditures for acquisition of non-financial assets (2.1/2)	6.54	6.17	4.09	94.13	67.10
3	Total expenditures and expenses - TOWNS AND MUNICIPALITIES (554 towns and municipalities)	100	100	100	106.59	110.56
3.1	Expenditures for acquisition of non-financial assets (3.1/3)	13.51	16.24	15.80	128.12	129.31
4	Total expenditures and expenses – TOWNS (126 towns)	100	100	100	107.34	110.90
4.1	Expenditures for acquisition of non-financial assets (4.1/4)	10.70	13.91	13.12	139.47	135.96
5	Total expenditures and expenses - MUNICIPALITIES (428 municipalities)	100	100	100	103.58	109.20
5.1	Expenditures for acquisition of non-financial assets (5.1/5)	24.64	25.82	26.59	108.56	117.85

The same conclusion in regard to the decrease of the share of expenditures for acquisition of non-financial assets was also reached at the level of towns and municipalities combined, but also individually at the town level. At the municipality level, the share of expenditures for acquisition of non-financial assets saw an increase (it was 24.64% in 2015, 25.82% in 2016 and 26.59% in 2017).

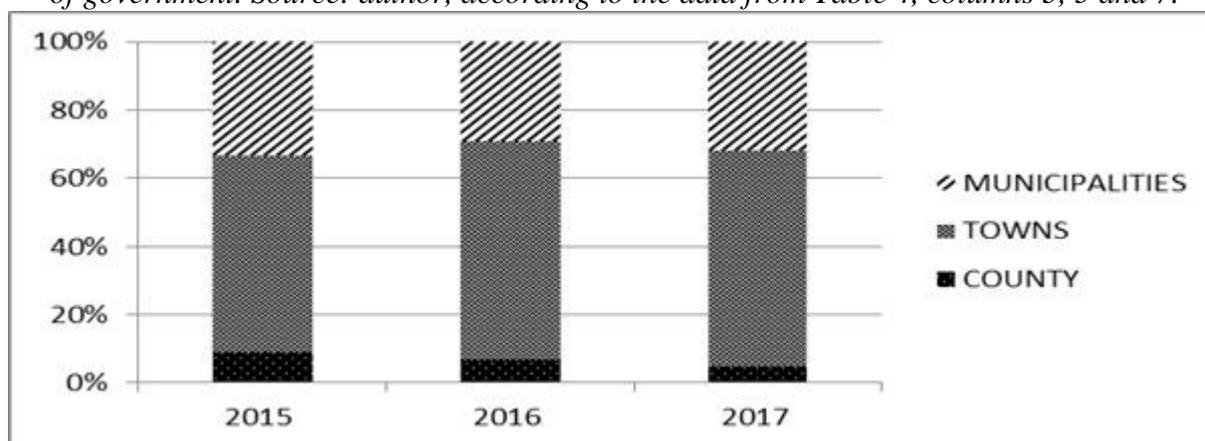

2.1.2. Expenditures for acquisition of non-financial assets by levels of government

Expenditures for acquisition of non-financial assets by levels of government are presented in Table 4. Regarding total effected expenditures and expenses for acquisition of non-financial assets, towns have the largest share, followed by the municipalities, whereas the counties have the smallest share of said expenditures and expenses. The share of the counties decreased and the share of the towns and municipalities increased.

Table 4: Expenditures for acquisition of non-financial assets by level of government. Source: author, according to the data of the Ministry of Finance available at <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>.

Level of government	2015	%	2016	%	2017	%
1	2	3	4	5	6	7
Counties (20 counties)	246,599,908	8.77	232,128,303	6.60	165,466,185	4.75
Towns and municipalities (554 towns and municipalities)	2,565,474,161	91.23	3,286,932,989	93.40	3,317,409,080	95.25
Towns (126 towns)	1,623,637,780	57.74	2,264,490,555	64.35	2,207,487,457	63.38
Municipalities (428 municipalities)	941,836,381	33.49	1,022,442,434	29.05	1,109,921,623	31.87
Total	2,812,074,069	100	3,519,061,292	100	3,482,875,265	100

Figure 1: Share in total effected expenditures for acquisition of non-financial assets by level of government. Source: author, according to the data from Table 4, columns 3, 5 and 7.

2.1.3. Expenditures for acquisition of non-financial assets at the county level

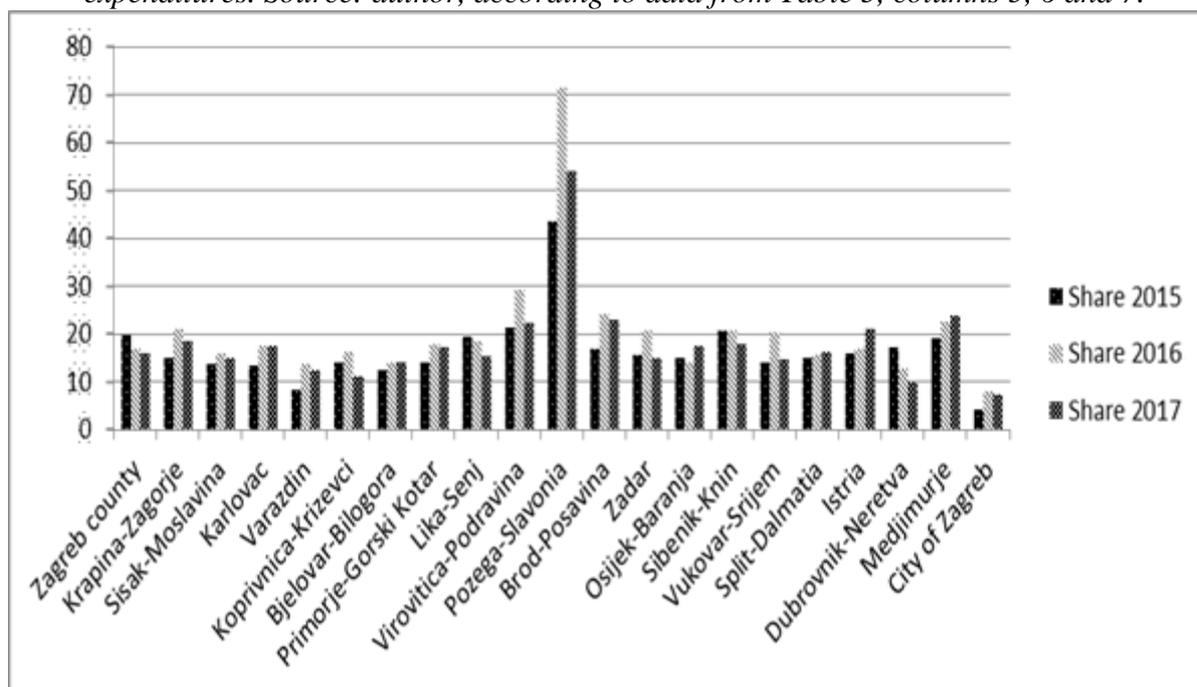

Changes in effected expenditures for acquisition of non-financial assets at the level of all counties and their share within total effected expenditures and expenses is presented below. Said changes are listed in Table 5 and they are also presented in Figure 2 for a better overview. Table 5 presents effected expenditures for acquisition of non-financial assets in total realised expenditures and expenses at the county level in 2015, 2016 and 2017. Data related to expenditures and expenses at the level of all counties includes expenditures and expenses of all municipalities, towns and counties. In comparison with 2016, the average share at the level of all counties decreased in 2017. In 2015, the average share at the level of all counties was 12.36%, in 2016 it was 14.66%, whereas in 2017 it was 13.91%. In 2017, the share of effected expenditures for acquisition of non-financial assets within total effected expenditures and

expenses at the level of all counties increased by 12.54% in comparison with 2015. Average amount of effected share at the level of all counties results from the impact of particular counties with below-average effected expenditures for acquisition of non-financial assets. However, there are some counties with above-average effected expenditures.

Table 5: Expenditures for acquisition of non-financial assets and share thereof within total expenditures and expenses at the level of each county. Source: author, according to the Ministry of Finance available at <http://www.mfin.hr/hr/ostvarenje-proracuna-jlprs-za-period-2014-2017>.

County	Expenditures for acquisition of non-financial assets (in HRK)			Share in total expenditures of each county		
	2015	2016	2017	2015	2016	2017

Total	2,812,074,069	3,519,061,292	3,482,875,265	12.36	14.66	13.91

Figure 2: Share of expenditures for the acquisition of non-financial assets in total county expenditures. Source: author, according to data from Table 5, columns 5, 6 and 7.

According to data from Table 5, in 2017, the share of expenditures for acquisition of non-financial assets in total expenditures and expenses at the level of all counties and the City of Zagreb was 13.91%, thus being lower than in comparison with 2016 (14.66%), as well as in comparison with 2014 (18.35 %). Expenditures for acquisition of non-financial assets are investments realised by local units for improvement of the living conditions in their areas. They include investments in town squares, parking lots, facilities and other (Mahaček, 2016).

3. AUDIT PROCEDURES FOR EXPENDITURES FOR ACQUISITION OF NON-FINANCIAL ASSETS

Audit of expenditures for acquisition of non-financial assets represents an integral part of the audit procedure for expenditures and expenses, which is conducted as a part of a financial audit. Effected expenditures are determined in accordance with legal provisions, the statute, ordinances and decisions of a relevant local unit. If internal documents and decisions, under which particular expenditures had been effected, were not in compliance with legal provisions, the auditors ordered harmonisation of said documents with legal provisions. Local units adopt the programme for the construction of municipal infrastructure facilities and the report on the implementation of said programme. When adopting and implementing the programme for the construction of municipal infrastructure facilities and the programme for municipal infrastructure maintenance, it is necessary to take the public interest into consideration and allow that individual interests are realised and protected in the manner that is neither contrary nor detrimental to the public interest (the principle of protecting the public interest) (Utilities Act, 2018, Article 5). In the audit procedure, it is also necessary to include the audit of compliance with legal provisions related to public procurement, which includes acquisition via agreements for the public procurement of goods, works or services supplied by one or several contracting authorities or entities from economic operators chosen by said authorities or entities, regardless of whether these goods, works or services are intended to serve a public purpose (Public Procurement Act, 2016, Article 1). Various business transactions related to the procurement of goods and services, payment of liabilities and potential procedures arising from the execution of an agreement by the supplier (default, complaints, etc.) are processed in the

procurement cycle. Procurement cycle usually consists of the following elements: issuance of a purchase order, procurement, processing of incoming invoices, payment, trade payables and general ledger. Main stages of control risk assessment in the procurement cycle are:

- “understanding and documenting the internal procurement control system based on the planned level of control risk,
- planning and performing invoice control tests for invoices related to a particular procurement cycle,
- assessing and documenting control risks of the procurement cycle” (Messier Jr., 1998).

Moreover, the same author also states that “proper segregation of duties is one of the most important control procedures in any accounting system. Duties should be assigned to individuals in such a way that no one can control the entire processing of a transaction. Otherwise, it will be impossible to detect potential errors. There are many different errors that may occur. Auditors must examine transactions and obtain information for each group of transactions to examine the accuracy of the performed procedure, i.e. verify whether the procurement of goods or services complies with the procurement approval policy.

4. CONCLUSION

The paper contains a study of expenditures for acquisition of non-financial assets in relation to their amounts, their share within total expenditures and expenses and changes in their absolute and relative amounts. The hypothesis that expenditures for acquisition of non-financial assets vary significantly by level of government (counties, towns and municipalities), that effected expenditures are significantly different per counties and that the expenditures are significantly lower than operating expenditures has been confirmed. Based on the study contained in this paper, it can be concluded that, during the observed period, total expenditures and expenses per counties have increased in almost all counties in terms of their absolute amount. The largest share in total effected expenditures and expenses relates to operating expenditures, followed by the expenditures for acquisition of non-financial assets, expenses for financial assets and repayment of loans. In total, at the level of all counties and the City of Zagreb, the share of expenditures for acquisition of non-financial assets have decreased. At the county level, as well as at the town and municipality level combined, the share of expenditures for acquisition of non-financial assets decreased. Said expenditures also decreased at the level of towns individually, whereas the share of expenditures for acquisition of non-financial assets increased at the municipality level. Therefore, it can be concluded that the municipalities have the largest share of expenditures for acquisition of non-financial assets, even though the towns have the largest expenditures for acquisition of non-financial assets in terms of their absolute amount. Regarding total expenditures for acquisition of non-financial assets, towns have the largest share in total effected expenditures and expenses for acquisition of non-financial assets, followed by the municipalities, whereas the counties have the smallest share of said expenditures and expenses. The share of the counties has decreased and the share of the towns and municipalities has increased. By analysing changes in effected expenditures for acquisition of non-financial assets at the level of all counties and by analysing shares in total effected expenditures and expenses at the level of each county (including expenditures and expenses of all municipalities, towns and counties), it can be concluded that, in the final observed year, the average share of said expenditures at the county level has decreased in comparison with 2016. In 2017, the share of effected expenditures for acquisition of non-financial assets in total effected expenditures and expenses at the level of all counties increased by 12.54% in comparison with 2015. At the county level, shares of effected expenditures for acquisition of non-financial assets in total expenditures and expenses are different. By examining expenditures for acquisition of non-financial assets in absolute amounts, it can be concluded

that, at the level of all counties, the absolute amount of expenditures for acquisition of non-financial assets in 2017 increased in comparison with 2015. However, in 2017, the absolute amount decreased in comparison with 2016. Any increase in expenditures for acquisition of non-financial assets is justified as long as it results in the improvement of the living conditions in a particular area, provided that the principle of cost-effectiveness is observed when spending any resources.

ABSTRACT

This article discusses the creation of an effective mechanism to attract investment in the regional economy with the participation of public-private partnerships, with a view to the successful implementation of large infrastructure projects of national importance. In the modern conditions of the development of the Russian economy, a public-private partnership is the most universal and effective interaction mechanism, creating the necessary effect for the development of various sectors of the economy. The need for modernization of the regional economy necessitates the need for further studies of the problem of attracting sufficient investment in the innovative development of the region, including the participation of public-private partnership, in the development of specific measures to improve the mechanism of investment support of the economy at the regional level, the development of strategies for investment support of the economy of the region with the participation of public-private partnership. Based on the study, the authors proposed a methodology for implementing the mechanism of investment support for the economy at the regional level. Also we formulated the conditions for improving the effectiveness of the mechanism of public-private partnership. The authors identified the tools that make it possible to increase the efficiency of interaction between government and business structures in the form of public private partnership and proposed the measures to increase the efficiency of management decisions of investing regional projects. In conclusion, the given article proposes specific measures to improve the mechanism of investment support of the economy at the regional level.

Keywords: *investment projects, public-private partnership, regional economy, government and business structures, the mechanism of investment support*

1. INTRODUCTION

Modern development is characterized by a systemic slowdown in economic growth, which is formed under the influence of adverse factors both external and internal environment.

At the same time, the external factors of negative impact can be attributed to the slowdown in the dynamics of world trade, the decline in the growth rate of the Chinese economy (which largely programs the world commodity situation), as well as the economic integration crisis in Europe, which continues to gain momentum. At the same time, it should be noted that the main internal reasons include the low level of investment attractiveness of the regional economies of the Russian Federation, poor institutional and infrastructure environment, as well as high costs of industrial business (defined, in turn, not innovative technologies and insufficiently qualified personnel). It should be emphasized that in order to analyze the prospects of investment activities, it is necessary to consider the General trends in the development of the economy of the state. Currently, most of the investments in the economy are made from public sources. Judging by the main investor countries in the Russian economy and data on capital outflows, we can judge that a significant part of investments from foreign countries are investments of Russian companies that were previously exported to other countries. In turn, this suggests that Russia is not as attractive a country for foreign companies and investors as it is customary to talk about. In modern economic conditions, in order to successfully implement major infrastructure projects of national importance, it is necessary to combine the efforts and interests of public authorities and private business representatives to achieve maximum effect. At this stage of development of the Russian economy, public-private partnership is the most universal and effective mechanism of interaction of this cooperation. The importance of the Institute of public-private partnership in Russia is increasing every year, creating the necessary effect for the development of various sectors of the economy. Competent formation and development of the mechanism of public-private partnership will create the necessary conditions for attracting investment.

2. CHAPTER 2

Public-private partnership should be the key to reforming the system of public administration, a new concept of relations between the state and business, which can become the engine of transformation in the system of public administration and in the commercial sector. As of the beginning of 2017, there were 2,183 public-private partnership projects in the Russian Federation that have passed the stage of commercial closure (signing of agreements), under which the total investment obligations (obligations to Finance the creation, construction, reconstruction) of the public and private parties are – 2,040 trillion. rubles, including the obligations of private partners – 1,336 trillion. rubles (65.4%). Speaking about the types of public-private partnership projects, it should be noted that concession agreements are most common. The authorities continue to learn from the experience of structuring public-private partnership projects at the Federal level in the road sector – the demand for the modernization of road infrastructure remains high. In June 2016, the first Federal concession for railway transport facilities was signed. We are talking about the construction of several facilities in the dry cargo area of the seaport of Taman with a volume of private investment of 500 million rubles. One of the most dynamic not only in the General economic scale, but also in the infrastructure circuit is considered to be the information and communication sphere. Today, projects aimed at maintaining public order and security are also being implemented in this area. In the field of solid municipal waste management, investors are ready for long-term partnership under the conditions of project complexity at each stage of waste management, as well as the inclusion of the project in the industry scheme. The demand for the implementation of such projects by foreign private investors is constantly growing. It should be noted that in 2016 in the Russian Federation there was a positive dynamics of growth of the market of public-private partnership projects, both in monetary and quantitative terms. Despite this, taking into account the nominal GDP of Russia at the level of 120 trillion. the potential for attracting investments has been realized by less than 1%.

For comparison, in a number of countries with a similar structure and volume of investment in infrastructure on the principles of public-private partnership, the percentage of the ratio of foreign investment to nominal GDP is much higher. This attitude, according to expert estimates, should be at the level of about 4-5%, then we can directly talk about a balanced process of attracting foreign investment on the principles of public-private partnership in the Russian economy. Foreign investment should have additional preferences. To interest entrepreneurs, the rate of profit of the business must be at least 20%. It is also necessary to develop the regulatory framework for the implementation of public-private partnership projects.

3. CHAPTER 3

Attracting foreign investments to the regions can stimulate the modernization of the economy and its development, for this it is necessary: to revise the existing state policy, to increase the investments of state corporations (which currently provide only about 30% of all investments), as well as to improve the quality of the investment climate. The development of territories, institutions of development of the country, ensuring the functioning of mechanisms to attract investment in the economy of the regions at the present stage in a number of countries is not effective. Corruption, administrative barriers, skills and educational attainment in both the public and private sectors are hindered (figure 1).

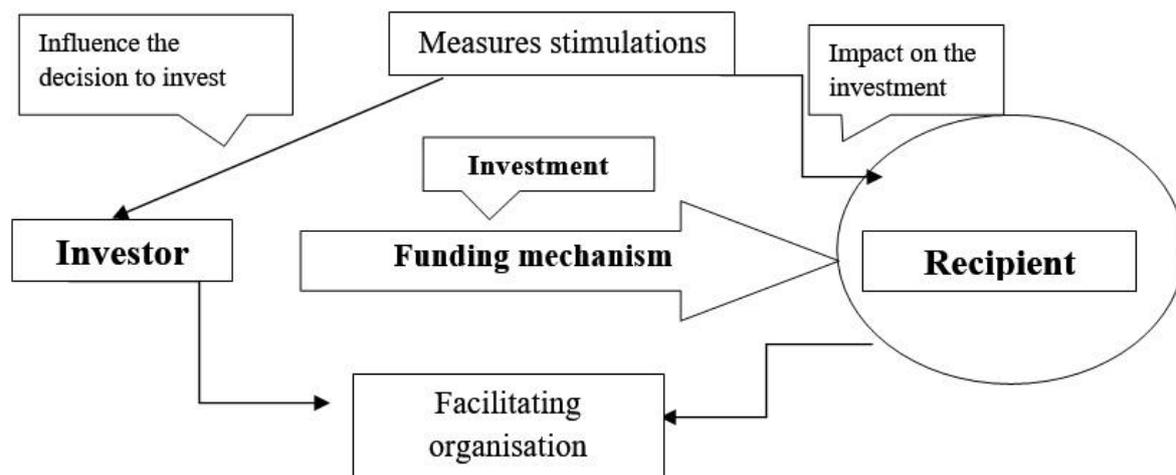

Figure 1: The mechanism of attraction of foreign investments

It should be noted that "in assessing the effectiveness of the mechanisms, first of all, it is necessary to consider the internal processes of the functioning of the system, as well as the significance of the results of the mechanism" (1). However, it is worth noting that there is a big difference in the level of development of the territories, as well as in the level of their investment potential. Thus, the regions of the Russian Federation rich in natural resources are actively developing, while the rest are experiencing an acute shortage of funds for development. Thus, in order to analyze the prospects of investment activities, it is necessary to consider not only the mechanisms of attracting foreign investment, but also the General trends of economic development. At the same time, the subjects of the Russian Federation have the right to provide tax incentives for regional taxes, thereby stimulating the inflow of investments and not diverting funds from the regional budget. However, these measures are not such a significant factor for the investor when making a decision. At the same time, it should be noted that "the strategy of investment development of the region should offer a specific set of program-targeted measures demanded by the regional economy and the world capital market, depending on the type of development of the region. It is obvious that all regional economies, United in the national geo-economic space, have different growth potentials and capitalization of regional industries.

Therefore, the use of the same measures and instruments in the practice of state regulation of investment development will have a different effect. Therefore, when forming the strategy of investment development of territories, it is necessary to take into account these features and use methods of attracting investments that demonstrate maximum efficiency." (2). Thus, for typology should be applied positioning model, which gives an idea of the nature of economic development of territories and its competitive advantages. It should be noted that the effectiveness of the investment policy, which is carried out, strongly depends on how it relates to the capabilities of the state and its territory. At the same time, it should be emphasized that in the formation of the investment development strategy, as a basic concept, one of the equilibrium theories should be chosen, which harmonizes the demand for investment and the supply of investment resources from the world investment capital market. Along with this, it should be noted that the formation of the investment strategy should be included in the program-target approach to strategic planning of socio-economic development of the state. If we talk about the investment strategy, then, in our opinion, it should be aimed at achieving and solving conceptual goals and objectives. It should be noted that " the development of ways to improve the management of investment activity requires the identification of factors on which the development of this process depends:

- creating a favorable investment climate and ensuring investment attractiveness;
- availability of land plots that the local administration intends to allocate for construction;
- availability in the portfolio of effective investment projects that contribute to the inflow of investments into the region from all possible sources, including from abroad;
- provision of the proposed construction sites, developed municipal, transport infrastructure and social facilities;
- availability of capacities of construction and installation organizations and enterprises, their material and technical base;
- provision of reserves of labor resources corresponding to the required qualification;
- the functioning of the real estate market, where economic relations between investors are manifested in the framework of operations carried out through real estate agencies". (3)

Ensuring high-performance management and economic development with the participation of public-private partnership is one of the most important tasks of the authorities. In accordance with international experience, public-private partnership is the most effective form of partnership between public authorities and representatives of private business. The creation of an effective mechanism, tools and forms of public-private partnership assists in attracting foreign investors to infrastructure projects, including socially significant ones. Developing and improving the mechanism of public-private partnership, public authorities and local governments will be able to further attract private capital in priority infrastructure projects (transport, information systems), objects of social importance (health, science, public safety), utilities, landscaping and other Tools that increase the effectiveness of the mechanism of interaction between the government and business structures in the form of public-private partnership (figure 2).

Figure following on the next page

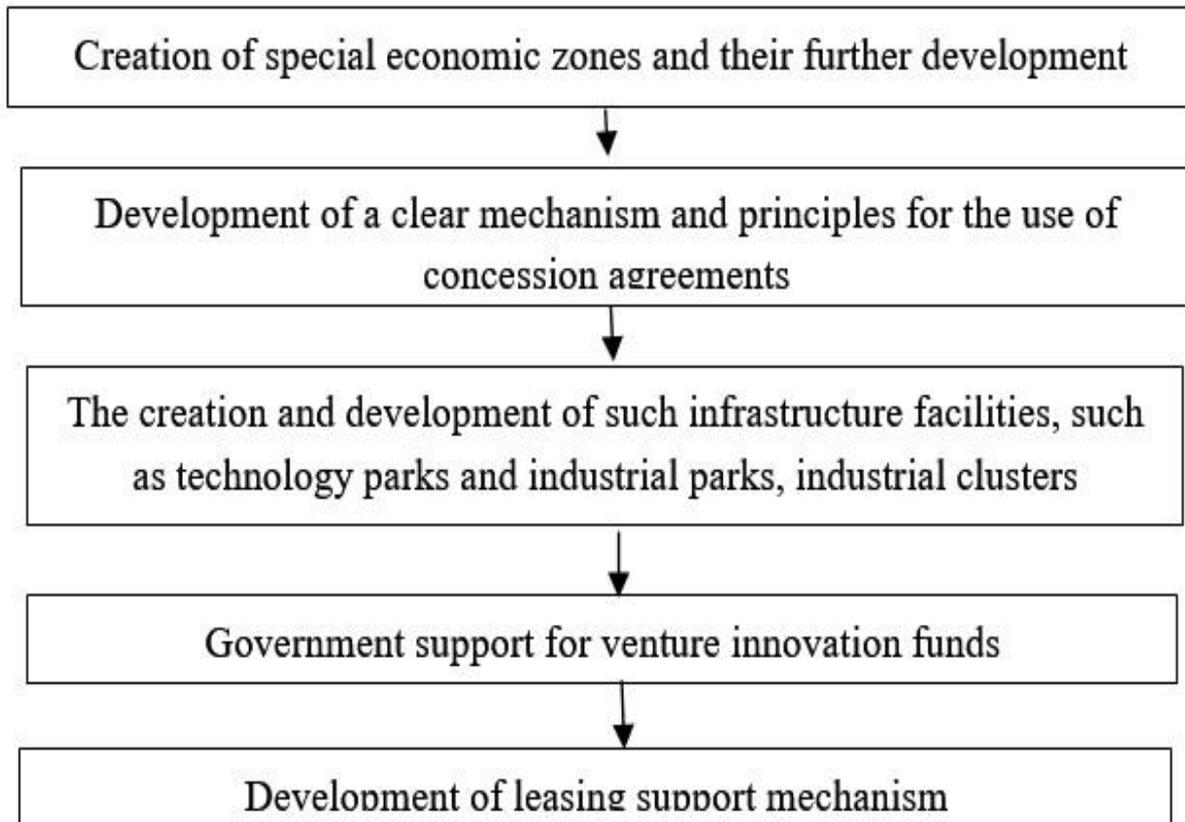

Figure 2: Conditions of increase of efficiency of the mechanism of state-private partnership

At the present stage, there is no common understanding of the mechanism of public-private partnership, which should become the core for the formation of an effective model of regional economic management. The lack of a common vision leads to the fact that the regions in their own way interpret the mechanisms of public-private partnership, and therefore forms this direction in accordance with their subjective understanding. This article suggests that in order to ensure the effectiveness of the partnership, as well as to minimize the problem of trust between the state and private partners, it is necessary to create a coordination Council – an Advisory body. The Council should be organized for the purpose of effective interaction between the state and business in the framework of public-private partnership. It should be noted that only the use of certain administrative management decisions can have an impact on the use of tools to attract investment in socially important industries, remove obstacles to the implementation of large-scale projects in the regions, and also allow the search for promising areas for investment. At the same time, public-private partnership should become one of the effective tools for the management of regional authorities on the way to success. In our opinion, the coordinating Council will have to address the following tasks:

- coordination of the activities of the Executive bodies of state power on the formation and implementation of state policy in the field of public-private partnership development in the territory of the state, the region;
- ensuring the interaction of potential investors with the authorities and development institutions;
- assistance and assistance in obtaining information on the forms of interaction and cooperation within the framework of public-private partnership;
- development of plans and programs for the development of mechanisms and forms of public-private partnership.

Each region, together with Federal agencies, should define its own key industries. At the same time, the competitive advantages of a region should be modeled in application to the widest possible range of industries, taking into account the development of the global market. Ideally, the public authorities responsible for the strategic development of industry in the country would have to develop several dynamic development programs, which in turn would allow:

- identify the most suitable for the country's priority sectors or clusters, which is possible only after a survey of both the business community of the regions and the collection of statistical data on a wide range (personnel, transport, energy balance, sources of raw materials, markets);
- the distribution of industrial enterprises should take into account climatic factors, as well as the factor of the presence of the industry labor market and sales market, transport schemes of the region and its place in the Federal transport system;
- in real time, it is necessary to track changes in the above markets in order not to create an overabundance or shortage of certain product groups, types of services;
- competitive advantages or differences that would allow to distribute certain types of production to certain territories should be defined and constantly adjusted.

4. CONCLUSION

The economy of the Russian Federation currently has a fairly progressive form, as well as a complex and multi-channel system of financing investment activities corresponding to the market conditions of management. However, in terms of efficiency of application, the level of use of these sources clearly does not meet the modern requirements of the market system of management. Therefore, it is necessary to implement a science-based and strategically developed system of measures to improve the efficiency of the use of each source of funding. In the future, in our time, the functional purpose and investment role of each basic group of these sources should be clearly defined. For budget sources, as well as today, they will be mobilizing, stabilizing and stimulating functions. Own funds, in turn, will retain the function of the main source of funds for investment development of territories. And attracted and borrowed funds, in the course of strengthening the long-term nature of their use, will strengthen its influence as a priority additional source of investment resources for the development and improvement of production. The investment impact of budget sources should remain consistently high, determining and orienting in the future. First of all, this is due to the innovative and social orientation of the economic policy of the Russian Federation, as well as their organizing and stimulating role in ensuring sustainable economic development. Along with this, the investment effect of budgetary resources may increase, especially at the expense of funds attracted under the guarantee of the territorial governments. The active use of borrowed and borrowed resources is of fundamental importance for economic development. In the future, the investment impact of attracted and borrowed financial resources on the growth of fixed capital in the economy should be steadily increasing. Basically, this applies to commercial investment lending, which, along with the budget, will be one of the major and significant sources of financing for investment activities. At the same time, gradually, with the stabilization of economic relations, priority will be given to medium-term and long-term loans. As potential sources of financial resources for investment lending can be considered, first of all, the funds of Russian banks, insurance and investment companies, such necessary - foreign investments. However, in order for the use of these resources to become strictly investment-oriented, it is necessary to have a progressive legislative framework that would clearly regulate the possibility and procedure for such operations, as well as ensure the safety and repayment of credit resources. At the same time, it is necessary to provide active tax incentives for the use of these resources in investment activities, as well as to form a progressive mechanism for involving financial resources in the investment process and ensuring their effective use.

Thus, in order to improve the efficiency of mechanisms for attracting foreign investment in the country, it is necessary to take a number of measures:

- improving the investment climate and increasing public investment in infrastructure;
- removal of political and economic barriers to foreign investors;
- development of the program of complex development of territories (economic justification of expediency of development of this or that branch);
- increasing economic independence of the subjects of the Russian Federation;
- formulation of priority areas of public investment on an annual basis;
- establishment of clear criteria for assessing the effectiveness of the use of Federal funds;
- professional development of personnel;
- stimulating innovative development;
- improvement of the Federal legislation regulating the conditions of public-private partnership.

For the process of increasing investment activity to gain further momentum, business needs real support from the Federal authorities, providing a set of measures aimed at ensuring that the participation of entrepreneurs in long-term investment projects is guaranteed to be economically profitable. According to the world experience, public-private partnership is the most effective form of partnership between public authorities and private business representatives. The formation of an effective mechanism, tools and forms of public-private partnership helps to attract potential investors in infrastructure projects, including social value. In conclusion, I would like to note that many countries face a huge task of economic modernization, which is important to solve in the near future, without this it is impossible to further development and effective functioning. To do this, it is necessary to carry out significant reforms that affect the mechanisms of attracting not only public funds and foreign investments, but also non-state financing of investment activities, including with the participation of public-private partnerships. Without this, economic growth is impossible. We believe that in the future, as the state policy and investment climate change, the role and effectiveness of mechanisms for attracting foreign investment will change. It is foreign investment that should contribute to the development of the country, therefore, the growth of the level and quality of life of the population.

ABSTRACT

As there has been an improvement on any other scientific field it does so on accounting sphere as well. We can see the same impact on the methods of uncovering the international accounting frauds. The latest developments have a great role on changing the effectiveness of the methods over detecting the accounting frauds. The insufficiency of traditional methods has brought about the studies for the new methods for further improvements on uncovering techniques for accounting frauds. The well-known financial scandals in the international ground that we faced (like Enron, Worldcom, Parmalat) has affected the trust towards capital markets badly. Because these scandals occurred due to the lack of audit facilities, the reputation of audit and assurance engagements were besmirched too. As the fraudulent acts are the major reasons for scandals, this led to need for new studies in accounting and audit. On the light of all these events, the Forensic Accounting has been arisen in the USA. Hence, the Forensic Accounting became the major science field in enriching the methods of struggling with uncovering and preventing the fraudulent acts in accounting. This study aimed to determine the awareness and the level of knowledge of Azerbaijani academicians about forensic accounting. The research includes accounting and finance lecturing academicians of miscellaneous universities in Azerbaijan. According to the results of the survey the forensic accounting is not known much by academicians, however, they expressed they would like it to be added to curriculum. Moreover, it is determined that academicians willing to see fraud, bribery and corruption titles in the content of forensic accounting related chapters.

Keywords: *Education of Forensic Accounting, Forensic Accounting, Profession of Forensic Accounting*

1. INTRODUCTION

The basic scope of facility of forensic accountants is composed of fraudulent and illegal operations. Beside these two targets, forensic accounting may functionize as a court supportive or give testimony as an expert authority for the relevant trials. One of the factors that triggered forensic accounting to emerge is the improvements in technology. On the light of technological improvements, as some professions come along so the others may disappear. As the fast changes and improvements in technology and communication bring about positive results, these may facilitate the commitment of complex crimes and high level aggravated fraud, too. Since the current systems were not sufficient to solve these sort of crimes, it necessitated the creation of new professional area and systems. Forensic accounting is the one of these proficiencies. Some of those developed countries, the USA particularly, that understand the importance of forensic accounting have been cultivating professional experts by fulfilling some needed infrastructure facilities. Leaning on the truth that there is not any work on this sphere in Azerbaijan, in this study the level of forensic knowledge of various accounting professors in

universities were measured. At the same time, the views of those lecturers about the scope of topics that considered to be added to curriculum were asked. At the end, there were some suggestions to related people. In the following parts of the study the necessity of forensic accounting was explained and the literature in this field was analyzed. In the last part all data had been undergone analyzes and results were prepared accordingly.

2. FORENSIC ACCOUNTING AND ITS NECESSITY

Since 1980, especially in western countries the reasons for the need for forensic accounting were the increase in numbers of applications on court, the complexity in trade operations, the raise in number of illegal acts of workers in companies and the difficulties of struggling with them, the failures that most of companies come across, and the courts need for experts support. [Bozkurt, 2000: 56].

Accountants work in three different channels on behalf of battling with these issues. These channels are; [Elitaş, 2012: 53];

- Consulting support for courts,
- Witness of experts,
- Audit of fraud/Investigating Accounting

As forensic accounting is considered to be one of the professional branch of accounting, its occurrence is due to the following factors; [Bozkurt, 2000: 56-57]:

- Trade operations have gradually become more complex. Thus, the number of litigations due to these reasons increased seriously.
- In societies, the problems in relationship between individuals and organizations have increased.
- The illegal acts and corruptions proliferated and both detection and protection of them have become rather difficult.
- The number of failed companies increased and these augmentations started to seem doubtful.
- Attorneys and courts needed more professional supports in trials.

The forensic accounting is the science field that in order to reveal the truth, by using its unique research, interrogation, and analysis techniques via the help of psychology and criminology, deals with the trials which transferred to court or has not transferred yet, but the major part of issue will probably be the conflict due to accounting related subjects. [Gülten, 2010: 312]. As the most general definition; forensic accounting can be defined as a type of service which provides a solution in a scope of principles, concepts and techniques of accounting, audit and law for legal, financial and social problems. [Elitaş, 2012: 54]. The number of internet scams and cyber criminals have increased, hence, need for the high level of securities addressed to these sort of crimes increased as well. The needed qualities on behalf of carrying out such prosecutions are of importance to the professional accountants. Most of forensic accountants who are at the beginning of their career come across the computer based problems, as the internet and e-trade have improved. [Pazarçeviren, 2005: 3]. In the past, managers or shareholders used to resort to forensic accountants just when they felt any probability of counterfeiting. Nowadays, however, American businessmen call on forensic accountants as an active fraud controlling way. Especially, the last company scandals (Enron, Worldcom, Adelphia, Xerox and etc.) raised the importance of audit and therefore the responsibilities of auditors. Fraudulent acts damage not only the owners and shareholders, they also wreak havoc to the staff, financial institutions, state and audit companies. Some malicious people can manipulate the figures and numbers easily while drawing up statement of financial position, preparing the ledgers and invoices. [Pazarçeviren, 2005: 2].

The subjects that belong to the scope of forensic accounting; lawsuits of conflict; lawsuits of personal action or objections to claimed debts; lawsuits that necessitate the arbitration; courts of mediation and fortification; joint ventures, transformation and liquidation, evaluation of firms; organizational analysis; equity determination lawsuits; accounting-finance analysis; partnership and shareholder lawsuits; fold-up of work, workout, and lay-off lawsuits; business/subcontractor fraud investigation and bribery; the lawsuits that belong to insurance coverage like traffic accidents, fire, and flood; financial dispute through the divorce cases; damage down to folding of enterprises and professional neglecting and so forth could be listed [Bekçioğlu, Coşkun ve Gümüş, 2013: 6]. Forensic accounting, besides, especially supporting the courts, can give a service in a various subjects. Those activities that might belong to the service frame of forensic accountants are; company evaluation, job neglecting, determination and protection of insurance operations and illegal acts [Grippio, 2003: 4]. Forensic accounting and its education, is respected sufficiently, in many developed countries, especially in the USA. By receiving the international organizations` and universities aid some necessary seminars and trainings are held on behalf of it. Meanwhile, in the outstanding countries the forensic accounting found a legislative grounds. The less developed and developing countries should follow the suit and integrate the same educations in order to boost up to the desired level. Of course, the major duty falls on shoulders of lecturers if they want to catch up with the forensic accounting perception level of the developed countries.

3. LITERATURE OVERVIEW

Bozkurt (2000), studied on his paper the presentation of forensic accounting in Turkey as a completely new sub-branch in accounting science. As a result, he tried to delineate the frames and coverage of forensic accounting, and reasons for need of this profession in Turkey. The crucial point in his study was the part where he revealed the huge gap of unsatisfied demand for this new profession in Turkey. Finally, in his study he showed how systematically Turkey ought to gain this profession through being organized ahead of time. Carnes and Gierlasinski (2001), in their study stressed on the forensic accounting skills, figured out the demand and supply status on accounting education. In conclusion, they concluded that the accounting service demanders expect the suppliers to be more proficient on detecting the frauds, and besides wanted the universities to release the coinciding students with these qualities. Rezaee, Crumbley, Larry and Elmore (2004), in their papers gathered the views of forensic accounting related academicians` and practitioners`. As a result of this study, majority of academicians and practitioners are optimistic about the future status of interest and demand in forensic accounting. Respondents of both sides in questionnaire see the accounting education beneficial and adequate for accounting profession. Kaya (2005), did a research on forensic accounting proficiency in accounting profession and necessity from point of Turkey. According to the result of this study it is possible to diminish the number of incurred losses due to the fraudulent and illegal acts in companies by the current circumstances of forensic accounting in Turkey. Pazarçeviren (2005), has given the information about the frame and features of forensic accounting. In conclusion, the writer pointed out to the difference between the independent auditors, internal auditors (controllers), and forensic accountants. Smith and Crumbley (2009), did a research in order to figure out the best pedagogical approach to improve the curriculum of forensic accounting. As a result of this study, they revealed that there was no any scientific responds to the given question, but few philosophical beliefs about it. Toraman, Abdioğlu and İşgüden (2009), put the light on the forensic accounting from point of view of preventing the money laundering crime. According to the result, while struggling with and concluding the crime the support of technical knowledge and skills of forensic accountants that they provided were indispensable and valuable. Gülten (2010), examined the forensic accounting concept from the point of view of the law.

As a result, the writer concluded that though it was just known in Turkey, the forensic accounting that is prevalent in the USA, Canada and European Union countries, would partially contribute to trials that are slackened due to the lack of expertise and would accelerate the legislation processes overall. Elitaş, Karakoç and Görgülü (2011), in their study aimed to determine the awareness of university lecturers about forensic accounting. They came to result where it shows the lecturers in Turkey strongly believe there is proper grounds for application of forensic accounting, however, there is a need for organizations that direct the forensic accounting profession through seminars, trainings, publishing and other means. At the same time, they noted that in order for the universities to become successful in the long run, the high educational institutions should have changed the current curriculum. Pehlivan and Dursun (2012), have conducted a survey work where they tried to figure out the point of the academicians` in Turkey towards the education of forensic accounting. They concluded that there was no sufficient educational infrastructure for forensic accounting, moreover, the active lecturers on accounting were reluctant about adding the forensic accounting to accounting curriculum. Bekçioğlu, Coşkun and Gümüş (2013), in their studies have touched on the use of forensic accounting as a preventing instrument the fraud and illegal act in companies. Consequently, the cultivation, organization and preparing the legislative grounds for forensic accountants on battling with fraudulent and illegal acts were considered necessary. Kurnaz, Serçemeli and Ibadov (2014), conducted a questionnaire in order to detect the point of view of Azerbaijani academicians towards forensic accounting education. As a conclusion, it is shown that there is not sufficient educational infrastructure in Azerbaijani universities, and lecturers are reluctant about adding the forensic accounting to accounting curriculum. Özdemir and Yıldırım (2017), made inquiry via questionnaire on the view of financial consultants, attorneys and judges about the tax lawsuits and forensic accounting relationship. In the end, the meaningful correlations between the service year, profession and age variables have been determined. Çayır and Akın (2018), have analyzed the businesses management frauds from both theoretical and practical side. In the study, they had been referred to forensic accounting, audit of fraud and managerial tricks titles. Moreover, therein study it is noted that in companies the frauds had been done by the professionals and could have been revealed by only professional forensic accountants. As a result, the data related to fraudulent files that had been committed in Burdur and Isparta cities in Turkey were analyzed in detail. In the end, the difference of this study, apart from the others, is to do more comprehensive research on view of academicians in Azerbaijan on forensic accounting. Another important point that distinguishes this study, is to reveal to what extent the view of academicians in Azerbaijan towards forensic accounting has changed since the last study in 2014.

4. SCOPE AND THE METHOD OF STUDY

This study covers academicians who work in accounting and finance departments of various universities in Azerbaijan. Approximately, there are 45 academicians in accounting and finance branch in Azerbaijan. Therefore the population of the study settled as 45. Via face to face meeting the questionnaire was carried out with all these people. There was not random choice among target population, in contrast, the target was the entire mass. Nevertheless, despite the all efforts, feedback had been gotten only from 28 people. And this number corresponds to %62 of feedback ratio. While preparing the questionnaire the previous studies and particularly Pehlivan`s (2010) study was taken into account. The questionnaire is composed of three parts. The first part includes the questions that reveal the demographic features of respondents, second part was designed to determine the demand and interest for forensic account education, and finally on the third part the topics to be included in the forensic accounting education were listed and respondents were asked to put their answers on Likert scale according the importance level from 1 to 5.

The numbers stand for the following meanings (1 = very unimportant, 2 = unimportant, 3 = neither important nor unimportant 4 = important, 5 = very important). The data that were received from the given questionnaire were processed and analyzed on Statistical Package for Social Science for Windows (SPSS 23,0).

5. FINDINGS AND ANALYSIS OF STUDY

In this part of the study the findings of the study are analyzed.

5.1. Reliability Analysis

The internal consistency coefficient of scale that indexed to determine the views of respondents about the topics to be included in the education of (Cronbach's Alpha) is 0.83. It stands to reason the scale is highly reliable for social sciences sphere.

5.2. Analysis of Demographic Features

Within the frame of the research 28 academicians took part in study. Among the respondents nearly % 68 are men and % 75 are graduate of doctorate. On the other hand, % 64 of the participants either have doctorate or still have ongoing doctorate program. It is obvious on the table 1 that the majority of academicians are aged between 26-35. From point of job practice; the half (%50.0) of the academicians have 6 to 10 years of experience.

Table 1: Demographic data about participants

		Frequency	Percentage
Gender	Men	19	67.9
	Women	9	32.1
	High school	0	0.0
Educational Status	Graduate	7	25.0
	Doctorate	21	75.0
Status	Professor	2	7.1
	Associate Professor	4	14.3
	Assistant Professor	18	64.3
	Research Assistants	4	14.3
Age	18 – 25	2	7.1
	26 – 35	12	42.9
	36 – 45	10	35.7
	46 – 55	3	10.7
	56 and above	1	3.6
Job experience	Less than 5 years	9	32.1
	6 – 10 years	14	50.0
	11 – 15 years	3	10.7
	16 – 20 years	1	3.6
	Above 20 years	1	3.6

The Table 2 below shows us the frequency and percentage range of views of academicians about the lessons related to forensic accounting.

Table 2: The Frequency and Percentage range of views of academicians about the topics related to forensic accounting education

No	Views	Yes (%)	No (%)
1.	Is the audit is given as a subject in your university's academic program?	39.3	60.7
2.	Do you think that accounting curriculum is sufficient?	64.3	35.7
3.	Does accounting curriculum need a drastic reform?	42.9	57.1
4.	Have you got any information about forensic sciences?	46,4	53,6
5.	Have you got any information about forensic accounting?	46.4	53.6
6.	Is there any separate forensic accounting subject in your current curriculum?	3.6	96.4
7.	Do you feel any need to put the separate forensic accounting subject in curriculum?	67.9	32.1
8.	Do you have any thought to integrate the forensic accounting education into your own institutional curriculum?	57.1	42.9

As it can be seen on the Table 2, the %61 of participants noted that they do not have the audit lesson. On the other hand, %64 of academicians are satisfied with the accounting curriculum, however, %36 are not. Notwithstanding, the %57 of academic participants think that the curriculum does not require that much serious reforms. For the questions number 4 and 5, %54 of respondents answered negatively. Namely, above the half of academicians have not any information about the forensic accounting overall. Therefore, according to this result, to see the lesson like forensic accounting in the curriculum cannot be expected. The answer of respondents to the question number 6 is a bit supportive to the previous one. In the given Table 2, on the one hand the dominant percentage, %96, say that they do not have the lesson like forensic accounting or related, on the other hand the promising figure like %68 of the same mass believe that the curriculum should have concluded such lesson. Meanwhile, %57 of respondents think that education of forensic accounting should be the part of institutional curriculum. On the other parts of the questionnaire the evaluations of participants on the related questions are so: Those %80 of academicians who have audit subject in their program have never given audit lecture, and %20 used to lecture in the past times. %68 of participants who affirmatively support the view that there must be forensic accounting in the curriculum, also stressed that the relevant institutions are not on the required level yet, however, for the beginning forensic accounting could be added as a separate chapter within audit books. "On what level should forensic accounting be given as a separate class by realizing the necessities like getting the support from the organizations, providing the lesson material, improving the students' interest?" Academicians answered to this question by noting that the forensic accounting should be given on master and doctorate program, %86 an 14 % respectively. So, the majority of participants think that forensic accounting is the class that should be given in the post bachelor education.

5.3. The evaluation of views of participants about the content of forensic accounting education

The Table 3 below shows us the arithmetic mean and standard deviation numbers of view of academicians about the topics that should be concluded in forensic accounting education. Not responded topics are not the part of the evaluation.

Table 3: Arithmetic mean and standard deviation figures according to the importance of topics of Forensic Accounting

No	Expressions	X	SS
1.	Professional career on forensic accounting field	2.50	1.213
2.	Professional organizations that support the forensic accounting	2.15	1.206
3.	Professional standards on forensic accounting	3.21	1.548
4.	Analytical review methods	3.00	1.579
5.	The reliability and privacy of knowledge	4.03	0.794
6.	The techniques of testimony and witnessing of expert	2.86	1.331
7.	The techniques of lawsuit consulting	3.00	1.167
8.	Evidence gathering rules	3.14	1.282
9.	Rules about the trials and cross inquiry techniques	3.07	1.532
10.	Financial reporting standards and principles	3.07	1.485
11.	Financial reporting and analysis	3.36	1.650
12.	Theory and methodology of fraud audit	3.85	1.432
13.	Audit standards against the fraud	3.79	1.263
14.	Determinations of fraud and deterrence programs	3.71	1.205
15.	Type of frauds	3.79	1.251
16.	Factors of fraud: oppression. opportunity and rationalization	3.79	1.477
17.	Education for preventing a fraud	3.71	1.437
18.	Controls directed to preventing a fraud	3.85	1.406
19.	Experience on preventing fraud	3.85	1.167
20.	Knowledge about law system	2.50	0.941
21.	Evaluation of internal control	2.50	0.941
22.	Manipulation of related parties	2.31	1.393
23.	Criminology, economic crimes, and crimes committed by white-collars	2.93	1.269
24.	Organizational governance	2.71	1.204
25.	Investigation of bribery and illegal acts	4.34	0.716
26.	Cybercrimes and fraud through computerization	3.79	1.262

According to the Table 3, the expression with the biggest arithmetic mean is “Investigation of bribery and illegal acts” with 4.34. Being more precise, academicians see the investigations on bribery and illegal crimes as the most important topic in forensic accounting. “The reliability and privacy of knowledge” is following next with 4.03 average unit. It leads us to say that participants consider the reliability and privacy of both financial and non-financial knowledge vital for the organizations. Moreover, it is obvious in the Table 3 that respectively the topics 12, 18, and 19 with 3.85 arithmetic mean value are also important topics that academicians would like to see in the curriculum. The common feature of those topics, as it stands to reason, is being related to fraud. The less important topic according to participants is the “Professional organizations that support the forensic accounting” with the average 2.15. However, this probably might be due to the lack of professional institutions on this sphere. The second less important topic is “Manipulation of related parties”, 2.31. Finally third less important expression is “Professional career on forensic accounting field”. The most probable reason for the latter with 2.50 average point can be seen as the low number of experienced forensic accountants since it is a new field.

6. CONCLUSION

Due to various reasons both accounting and audit professions undergo some changes. In order to be successful the accountants and auditors should keep up with the current conditions and renew themselves accordingly. Because the scope of activity of these professions is extending fast and gradually. Consequently, new types of professions occurred in these fields. Forensic accounting is the one among them. By using their investigating and analyzing skills, the owners of this profession try to reveal the fraudulent and illegal acts committed by very professional and in most cases educated people. In Azerbaijan as in many other spheres, there are improvements in economy as well. So, in order to meet the above-mentioned changes the infrastructure should boost up to required level hence, skilled professionals must be cultivated. Otherwise, detection of financial crimes will be too difficult. Thus, for revealing such crimes forensic accountants seem to be a must. Forensic accounting and its education are considered as important by most developed countries. Unfortunately, this is not even at the project-level of developing and less developed countries. Study concludes that much less the forensic accounting is given as a lesson at the universities or in any other educational institution, the majority of academicians are not informed about the existence of forensic accounting. However, the respondent academicians deem the forensic accounting important to be added to curriculum of accounting education, particularly to the post-bachelor level. The topics that the academicians see as important cover fraud, bribery and corruption. For improving the forensic accounting profession in Azerbaijan; it has to be as a mandatory lesson in related faculties of universities, the global changes should be kept abreast and required training and seminars should be carried out. In fact, the relevant infrastructure should be settled and this issue need to be granted legal status. Besides, various groups should support the forensic accounting, especially academic environment.

CREATION OF ORDINARY MARKET INSTITUTIONS AND POTENTIAL OF AZERBAIJAN ECONOMY FOR SUSTAINABLE DEVELOPMENT

Faig Huseynov

Azerbaijan State University of Economics (UNEC), Azerbaijan Republic
faiq.huseynov@unec.edu.az

ABSTRACT

The article deals with the Azerbaijan Republic' potential of developing with the support of financial intermediary institutions. There are many ordinary steps for realization of this goal. The aim is to analyze the mechanisms of stimulating creation of ordinary financial intermediaries and supplement public finance with private capital. Every country' sustainable development requires resting on long history proven basics-free entrepreneurship, banking industry, commodity and stock exchanges. Capital scarce emerging market countries need more market-oriented institutions for converting people' income into investment through saving. Low level of share of market capitalization in GDP, high share of prime working and mature working age population display potential of unused savings of people. Stock market, mutual funds, pension funds, mortgage associations may attract free disposable money into financial circle and resolve multi-purpose targets. The economy will get money resources requiring effective use, the people will have current and future rewards as dividends and growth in pensions. Development of financial institutions will contribute for restructuring of the economy into efficiently functioning mechanism and attract foreign direct and portfolio investments. The bank credit possibilities for economic development has exhausted itself. This explains the necessity of forming these institutions for future sustainable development at after-oil period of Azerbaijan. The creation of discussed mechanisms in the article in short period requires regulation and stimulation by strong tax and finance incentives. The coordinated strategy to improve and consolidate the work of legislative and executive power in Azerbaijan in the direction of creation and development of market-oriented financial intermediary institutions may change Azerbaijan' oil-dominated economy into a developed market economy.

Keywords: *financial intermediary institutions, market capitalization, stock market, pension funds, mutual funds, savings, tax and finance incentives, Azerbaijan economy*

1. INTRODUCTION

After collapse of the Soviet Union emerging independent republics switched from the way of planned economy into a free market economy road. The road required continual reforms of creating market economy elements and institutions from the old non-flexible system elements. In Azerbaijan within a short historical period in the result of the reforms, significant results were achieved in the fields of socio-economic development and integration into the world economic system. Joint exploitation of oil reserves with transnational companies involved foreign capital into the republic. High oil revenues had significant impact on large-scale investment in infrastructure along with rapid diversification of the economy. Oil and gas was central to Azerbaijan's economy. "During the oil price boom (2006-14) hydrocarbon (HC) activity accounted for three-quarters of GDP and government income, and 90 percent of exports." (IMF, p.4) However high dependence on the volatile oil sector adversely affected by price fluctuations. The downward trend of prices in 2014 had negative effects on Azerbaijan economy and banking sector. The Central Bank of Azerbaijan Republic for saving foreign currency reserves undertook a 25 percent first devaluation in February 2015 and a second 32 percent devaluation in December 2015, and choose a managed floating exchange rate regime.

The depreciation of manat against USD had decreased GDP in USD in overall and per capita terms. The same pattern is observed in GNI of Azerbaijan. The perspective of Azerbaijan rising to high end of the level of upper-middle income country (12055 USD) became more complicated.

Table 1: GDP and GNI of Azerbaijan ("Azerbaijan in figures 2018" p. 199; World Bank data)

	2013	2014	2015	2016	2017
<i>GDP mln. AZN</i>	58 182,0	59 014,1	54 380,0	60 425,2	70 135,1
<i>GDP mln. USD</i>	74 164,4	75 234,7	52 996,8	37 862,8	40 750,2
<i>Per capita AZN</i>	6 258,3	6 268,0	5 706,6	6 269,6	7 205,0
<i>Per capita USD</i>	7 977,4	7 990,8	5 561,5	3 928,6	4 186,3
<i>GNI per capita, Atlas method USD</i>	7450	7700	6550	4760	4080

The Central Bank of Azerbaijan through tightened monetary policy had addressed inflation and supported the currency. Though these adequate policies had helped to overcome the challenge, the lack of versatility in reforms for creating full set of financial infrastructure of market economy is a main hinder in the way for full utility of potential for the growth of the economy.

2. FINANCIAL INFRASTRUCTURE IS AN ATTRIBUTE OF MARKET ECONOMY

It is common knowledge that every country' sustainable development requires resting on long history proven basics-free entrepreneurship, banking industry, commodity and stock exchanges. A market economy for efficient functioning requires along with free entrepreneurship a financial mechanism stimulating optimal ratio of consumption and saving, and converting private savings into productive investments. Without such financial mechanism, the efforts to diversify economy and boost sustainable economic growth are half-measures resulting in development of low productivity sectors. The economic reforms must account for all sides of economic development, mobilize labor and finance resources. Private capital scarce emerging market countries need more market-oriented institutions for converting people' income into investment through saving.

2.1. Income and savings of the people

Table 2: Income, expenditure, savings of population (million AZN) ("Azerbaijan in figures 2018" p. 172; p. 259)

	2013	2014	2015	2016	2017
<i>Income of the population</i>	37 562,0	39 472,2	41 744,8	45 395,1	49 162,9
<i>Expenditures</i>	28 021,2	30 799,6	34 963,4	39 775,0	45 152,5
<i>Saving</i>	9 540,8	8 672,6	6 781,4	5 620,1	4 010,4
<i>Bank savings of population</i>	6 395,8	7 188,4	9 473,9	7 448,7	7 561,2
<i>of which</i>					
<i>in national currency</i>	3 888,3	4 422,4	1 420,2	1 517,3	2 532,9
<i>in per cent to total</i>	60,8	61,5	15,0	20,4	33,5
<i>in foreign currency</i>	2 507,5	2 766,0	8 053,7	5 931,4	5 028,3
<i>in per cent to total</i>	39,2	38,5	85,0	79,6	66,5
<i>Ratio of savings to previous year, per cent</i>	125,1	112,4	131,8	78,6	101,5

Table 2 shows that, despite the growth in household incomes, a stronger increase in expenditures had decreased savings. However, there is an increase in bank savings (increase-decrease-increase shape) and the amount of bank savings is more than savings. This contradictory situation explains that public confidence in the financial sector is not exhausted and the people converted savings at hand into the bank savings.

2.2. Road of savings to investments

In the situation described above, the main task is to convert these savings into productive investments and increase income from the investments and savings of people. For the implementation of this task, a financial infrastructure with incumbent financial intermediaries is a necessary attribute of the economy. Ross Levine and Sara Zervos empirically had found “a strong, positive link between financial development and economic growth and the results suggest that financial factors are an integral part of the growth process.” (Levine, Zervos, p. 558). The financial factors imply existence and activity of financial intermediaries. Therefore, development of ordinary institutions of market economy, as stock markets, mutual funds, pension funds, mortgage associations in Azerbaijan has great importance.

2.2.1. Market capitalization

In Azerbaijan, the share of market capitalization in GDP is low. There are no on a regular basis published statistical figures about Azerbaijan’ stock market capitalization. According to data of IndexMundi market capitalization of Azerbaijan in 1999 was 3.22 mln. USD. (IndexMundi). Azerbaijan’ market capitalization reflected as 1.973 mln. USD (as of 07/2017) by the National depository center of the Azerbaijan Republic on the “AECSD profile 2017” prepared by The Association of Eurasian Central Securities Depositories (AECSD Profile 2017, p.6). GDP of Azerbaijan in 1999 was 4.477,5 mln. USD, in 2017 28.564,8 mln. USD. Accordingly, market capitalization to GDP ratio was 0.07% in 1999 and 6.9% in 2017. Despite this advancement during 18 years in the market capitalization, the level of it is not sufficient for the required scale of development.

2.2.2. Development of stock market

In “Azerbaijan 2020: Look into the future” Concept of development provides for “systemic measures in order to limit the disorganized market of securities and increase the attractiveness of the market for investors, and the legislation that regulates the activities of the market’s professional participants and mechanisms of overseeing them” (p.14). There is great need for increasing the rate of market capitalization in the country’s economy and extended use of investment institutions activities directed at the financing of viable economic projects through the stock market. For a stock market development is needed a stock market index. It is a measurement of a section of the stock market and used to compare the return on investments. For creating investing institutions, this index is an important element. The complex stock market institution functioning is based on supply and demand. For the liquidity of a stock market, either side must be in sufficient volume. For determining of demand side level, must be created the organized market of securities. However, for the formation of constructive demand for investments tools creation of mutual funds, pension funds, and mortgage associations is a necessary step. These funds may attract free disposable money into financial circle and resolve multi-purpose targets. The economy will have choice to get money resources requiring effective use; the people will have current and future rewards as dividends, interests and growth in pensions. Development of financial institutions will contribute for restructuring of the economy into efficiently functioning mechanism and attract foreign direct and portfolio investments.

2.2.3. The role of banks

Monopoly position of the banks in the credit market eliminated competition and their contribution possibilities for economic development has exhausted itself.

Table 3: Provision with credit of economy (end of year, Million AZN) ("Azerbaijan in figures 2018" p. 259)

	2013	2014	2015	2016	2017
Total credit to economy	15 423,0	18 542,6	21 730,4	16 444,6	11 757,8
of which					
short-term	3 335,5	3 931,3	5 297,3	3 478,0	2 101,3
in per cent to total	21,6	21,2	24,4	21,1	17,9
long-term	12 087,5	14 611,3	16 433,1	12 966,6	9 656,5
in per cent to total	78,4	78,8	75,6	78,9	82,1

This explains the necessity of forming new for Azerbaijan but old for free market economy countries financial intermediary institutions for future sustainable development at a post-oil period of Azerbaijan.

2.2.4. Financial intermediaries

Historically emerged financial intermediaries are being perfected with the development of market economy and changing economic environment. However, Azerbaijan lacks long period of development for traditional market institutions. Therefore, the government has to play leading role in the creation and stimulation of these institutes by tax breaks and financial injection where they are necessary.

2.2.4.1. Pension funds

Life-cycle hypothesis, developed by Franco Modigliani and Richard Brumberg states that individuals seek to smooth consumption over the course of a lifetime – borrowing in times of low-income and saving during periods of high income. The population tend to save for future periods. The pension funds may be very attractive vehicle for savings. Azerbaijan implements pension system reform aimed at linking benefits almost entirely to individual retirement accounts. Retirement ages and contribution periods are gradually being increased. Annual pension fund deficits (some 3 percent of GDP) should gradually be eliminated. (IMF, p.14). Creation of private pension funds may render pensions before formal retirement age. Now in Azerbaijan about 1.3 million person receive pensions and annual amount of these payments is about 3.3 billion AZN. At least the private savings for pension age may be about the same amount. In 1917 share of the prime working age population (25 to 54 years old) and mature working age population (55 to 64 years old) were 45.6% and 10.6% accordingly. As a determinant of savings it is normal figure for the potential of saving growth. And financial incentives as tax breaks can stimulate savings of these people to the fund. Tax exemption of savings to the pension fund and future benefits may attract population' interest to savings. The economy will have free finance resource for investments. The Tax Code of Azerbaijan provides for "insurance premiums paid by employer to insurers of the Republic of Azerbaijan on accumulative life insurance and pension insurance under contract concluded for not less than 3 years, any amounts paid to the insured and beneficiary after 3 years term from the moment of entering the accumulative life insurance and pension insurance contract into effect shall not be subject to income tax" (The Tax Code article102.1.8). However, tax breaks for the pension funds activities must be clear-cut for attracting savings and investing. For preventing misuse of fund resources must be determined by legislation the management rewards as percentage of revenues from investments.

2.2.4.2. *Investment funds*

An open-end investment company-a mutual fund pools money together from a large number of investors and uses that money to buy stocks, bonds and other securities. The creation of mutual funds may attract the population' free financial resources and direct them into viable projects. For the beginning, the government may temporarily participate as a partner in mutual funds activities to supply a source capital. As far as the mutual fund will begin to operate self-dependent, the government takes away its share and the mutual fund becomes a private one. For the stimulation of creation and development of mutual funds the government may temporarily grant tax breaks for the profit of a fund and the dividends of investors. According to the Tax Code of Azerbaijan "the annual interest income paid on deposits of individuals by local banks and branches of foreign banks in Azerbaijan, as well as dividends on investment securities, discounting (difference caused by lower placement of bonds than its nominal value) and interest income paid by issuer - within 7 -year period beginning from 1 February 2016 shall not be subject to income tax"(The Tax Code article 102.1.22). However, the profit of investment funds need exemption from taxes during a certain period, too. The profits by the enterprises using the investment fund resources are being taxed for tax on profit and the investment funds receive dividends after profit tax. Therefore, the income taxed once may be exempted from second time tax.

3. CONCLUSIONS

The coordinated strategy to improve and consolidate the work of legislative and executive power in Azerbaijan in the direction of creation and development of market-oriented financial intermediary institutions may change Azerbaijan' oil-dominated economy into a developed market economy. The creation of discussed here financial mechanisms in a short period requires regulation and stimulation by strong tax and finance incentives. At first, must be created the demand side for the financial resources. This includes creation of organized stock market and a stock market index. The growth of listed companies will contribute to the market capitalization. The development of stock market will require and attract the free private capital. This private capital may be organized as pension funds and investment funds. For the formation of demand side for financial resources, the government may effect tax stimulation and financial participation:

- Temporarily exemption from profit tax the pension and investment funds revenues;
- Temporarily participation of the government as a partner in the activity of pension and investment funds;
- Legislatively determination of the managers rewards of funds as percentage of revenues.
- The pensions from the pension funds may be received earlier the retirement age.

At second, for stimulating of supply side for the financial resources the tax exemption may be of great importance:

- Allocations from wage and salaries into a pension fund may be exempted from income tax;
- Received pensions from a pension fund may be exempted from income tax.

Proof of this article' claims is the history of free market economy countries.

After creating full set of free market institutions in Azerbaijan next step will be assuring of their more efficient functioning.

THE ASPECTS OF ECONOMIC SECURITY: BUDGET, TAX AND MONETARY

Farida Shamil Amirova

*Associate Professor at Azerbaijan State University of Economics (UNEC)
f.amirova51@mail.ru*

ABSTRACT

The article points out that ensuring economic security is, first of all, the government's responsibility, since fiscal and monetary policy plays an important role in the general economic policy of the state. Therefore, in order to improve the economy, the state chooses such stimulating instruments of fiscal policy as increasing government spending, reducing taxes or their combination. When implementing a stimulating fiscal policy, a significant impact on economic growth is provided by forms of financing the state budget deficit: borrowing or issuing new money for circulation. Thus, with the increase in the volume of goods and services, the number of employees involved in the process of economic growth proportionately increases, and the income tax on workers and individuals engaged in private and small businesses should grow at a higher rate. The next major component, tax revenue is the tax on net profit of enterprises and organizations. To do this, it is necessary to stimulate the effective application of new technologies and innovations in enterprises and organizations, where it would be possible, in our opinion, to achieve a high growth rate of "net profit". The state in this direction has been pursuing a successful policy of economic development in recent years, which aims at reequipping the economy of nanotechnology and innovation.

Keywords: *macro finance, stabilization, finance, stability, economic security, financial flows, economic policy*

1. INTRODUCTION

One of the aspects of the current problems of the economy is the problem of monetary and fiscal policy of the state. It should be noted that this problem is also the main mechanism of economic security. It should be noted that in this direction the government uses fiscal and monetary policy. Sometimes not the right policy, for example, fiscal can lead to undesirable economic consequences. The importance of the complex of instruments of monetary regulation, given the underdevelopment of the financial infrastructure, is an important issue for avoiding unfavorable for the economy. Changes in aggregate demand, real GDP, employment and inflation through government revenues and expenditures. Therefore, the focus is placed on the discretionary and non-discretionary fiscal policies, stimulating and constraining and promising fiscal policies. In accordance with the economic goals, the level of development of the economy and its condition, the government of the country determines for itself the priority tasks in the sphere of fiscal and monetary policy. In this policy, the main criterion for the effectiveness of fiscal policy is the level of collection of budget revenues, liabilities, the magnitude of the budget deficit, growth rate and public debt. To fulfill these goals, macro-financial stabilization is of great importance. This is the development and implementation of balanced public policy in this area. Monetary and fiscal aspects of economic security are in modern conditions a pressing problem of economics.

2. STABILIZATION

Ensuring economic security is, first of all, the responsibility of the government, since fiscal and monetary policy plays a large role in the general economic policy of the state. The criterion shows how much of the savings in the economy is not transformed into investments and thus the country's potential is not used up [1].

Here we can talk not only about how we should protect the economy from any threats with fiscal methods. Indeed, in some cases, precisely the wrong fiscal policy can lead to undesirable economic consequences. The government's fiscal policy, given the underdevelopment of the financial infrastructure, disruptions in the mechanism of stimulating savings and investment in the real economy, in countries with market economies, continues to remain important in the complex of instruments for monetary regulation of the stability of the Azerbaijani economy. As is well known, discretionary fiscal policy is distinguished, which is a conscious means of manipulating taxes and government spending and non-discretionary fiscal policy based on the principle of operation of the so-called built-in stabilizers. Discretionary fiscal policy is an attempt by the government to prevent adverse changes in the economy of aggregate demand for GDP, employment and inflation with government revenues and expenditures. In itself, the concept of "discretionary" policy means that the state, at its discretion, changes the size of revenues (taxes, fees, etc.) and expenses, thereby trying to actively influence the evolving situation in the national economy and the monetary and financial system. There are two main types of fiscal policy: stimulating fiscal policy and restrictive or forward-looking fiscal policy. Stimulating fiscal policy, as a rule, is aimed at exceeding the budget expenditures over the revenue side. In other words, it implies an increase in the budget deficit. Stimulating fiscal policy is carried out in a period of economic recession, when the economy is declining investment activity due to aggregate demand. In order to improve the economy, the state chooses such stimulating instruments of fiscal policy as an increase in government spending, tax cuts, or a combination thereof. When conducting a stimulating fiscal policy, forms of financing the state budget deficit have a significant impact on economic growth: borrowing or issuing new money into circulation. The restraining fiscal policy is chosen by the state at the stage of economic growth in order to "sue" the economy and prevent the growing aggregate demand from inflating inflation, which, in turn, can bring the economy to the stage of an undesirable slump. When pursuing a constraining fiscal policy, the government cuts government spending, raises or combines certain taxes. Non-discretionary fiscal policy, as is well known, assumes that if the government does not take active measures to influence the economy, the built-in stabilizer can be used in the tax system, net government tax revenues (taxes minus transfer payments and receipts) increase during the economic recovery stage and decrease during a downturn, i.e. automatically changing is exactly the opposite of changing the cycle of entrepreneurial activity. In this sector, it is important to control the tax and budget burden on GDP. The fiscal burden on GDP can threaten macroeconomic stability. Here it is necessary to take into account the increase in the expenditure side of the budget. Therefore, the state in its economic policy in this expansion should look for ways to stimulate an increase in GDP. In modern conditions, one of the most important ways in this direction is the intensive development of the non-oil sector, stimulating credit policy, the development of small and medium-sized businesses, and the successful development of the agricultural sector and the services sector. Also important is the tax burden, the dynamics for tax revenues in the budget. Thus, the current tax policy in ensuring economic security in this direction should be structured so that the risk associated with the dependence of the budget on the level of tax collection can be reduced. It should be noted that the value added tax is one of the best sources for replenishing the budget. Dark GDP growth is mainly associated with an increase in production and, accordingly, with an increase in the output of goods and services that are subject to value added tax. This also requires strengthening tax discipline. In this direction, the ongoing tax policy — income tax to the budget — is also interesting. Since the increase in the volume of goods and services increases proportionally the number of workers involved in the process of economic growth and income tax on workers and individuals engaged in private and small business should grow at a higher rate. The next major component of tax revenues is a tax on the net profit of enterprises and organizations.

To do this, it is necessary to stimulate the effective use of new technologies and innovations in enterprises and organizations, where our opinion could be achieved to achieve a high dark growth in “frequent profits”. The state in this direction in recent years has been pursuing a successful policy of economic development, which is aimed at rearming the economy of nanotechnology and innovation. In accordance with the economic goals, the level of development of the economy and its state, the government determines for itself the priorities of the budget policy. One of the objectives of fiscal policy in countries with market economies is to finance those industries where private entrepreneurship and market relations do not work or work inefficiently, and also those areas require protection of interests of certain segments of society or the population as a whole. According to the tasks, the state budget is regulated. The approach to the problem of regulation of the state budget may be different. In this case, there is no concept of optimal strategy. Some economists and politicians believe that the budget should be balanced annually. Others adhere to the concept of a cyclically balanced budget (the budget with either a deficit or a surplus). The main criteria for the effectiveness of fiscal policy are the level of collection of budget revenues (including taxes), the level of budget commitments, the magnitude of the budget deficit (surplus) and the rate of growth (reduction) of public debt. The place of the state in the economy is characterized by the ratio of state budget expenditures to GDP, i.e. fiscal burden, as well as the ratio of tax revenues to the budget and GDP - tax burden. The higher these ratios, the greater the role played by the state in the economy. One of the most important problems of economic security is the ongoing monetary policy. Monetary policy, based on the model of monetarism, is conducted by the Central Bank, which stabilizes the situation in the currency and money markets. These measures are for macroeconomic stability. In increasing the macroeconomic profitability of the budget has played the role of continuous improvement in the monetary sphere. Monetary policy supported the fiscal sector and macroeconomic stability. This policy has played an important role in the process of economic growth. Especially noteworthy is the economic growth that began in 1996, which for today's 2017 is of a long-term nature. The exchange rate of the national currency remained stable, strategic currency reserves remained, and economic growth continued. But the crisis in Europe has affected the rate of the national currency. In this direction, the profitability of the economy is the main indicator. In general, the situation in the money market is considered satisfactory if the value of profitability exceeds the inflation rate i :

$$P > i$$

It should be at least higher than the rate of inflation or, in the best variant, exceed inflation by 3-5%. The ratio of profitability and level of interest rates should be observed:

$$P > il > id > i$$

where: il - rate on loans

id - deposit rate

Savings in the economy should be structured as follows: cash, deposits, national currency, foreign currency, securities, national and foreign stocks of national companies, bonds of foreign companies, real estate and under-utilization of investments for capital investments. In modern conditions, macro-financial stabilization of the country as the main parameter of dynamic economic development is of greater importance. Especially important are key areas such as cash flow management, credit relations, inflation processes and other elements of the country's macro-financial stability. Depending on the basic tendencies of world economic relations, adequate models and mechanisms of the state fiscal policy are required, which will allow

increasing the efficiency of managing financial flows and will facilitate provision. Macro-financial stabilization of the country, its competitiveness and economic sustainability. Macro-financial stability of the country creates a real opportunity to implement large national projects, actively participate in regional and international projects, ensures successful specialization in the processes of international division of labor, strengthening in the global financial and commodity markets, etc. Considering the problems and significance of the concept of "macro-financial stabilization" it is necessary, first of all, to deal with the essence of the term "stability". "Stability" comes from the Latin word and implies the attainment of a state of the economic system that can be maintained for a long time with the help of its inherent regulatory means. Economic stabilization should not be viewed as a state, but as a strategic process, consisting in approaching economic stability. One of the founders of the classical theory A. Smith believed that stability is formed in all areas of the economy without exception. His theoretical development was that the reasons that violate economic stability can be both objective and subjective, namely: war, laziness of the nation, government [5]. Based on the above classical theories and scientific approaches, it can be noted that economic and financial equilibrium is one of the fundamental principles of stability and economic security of the state as a whole and can act as a guarantor of the country's financial stabilization. Macro-financial stabilization of the country covers the effectiveness of all factors of economic development, different elements and approaches to the state economic policy, rationality and sustainability of the basic mechanisms of the country's economic security [4]. It is worth noting that the financial stabilization and economic security of the country requires the balancing of various external and internal factors, which are accompanied by deformations of the World Economic Relations. So in the modern world, which is rapidly developing, a special place is occupied by the economic security of each state in the system of world economic relations. Economic security is directly derived from the level of economic stability, in particular, the country's system, the main element of which is financial resources. Here it is necessary to consider the definition of this concept: financial resources at the macro level are monetary funds that are formed in the process of distribution and use of GDP for a certain period of time. Financial resources at the macro level constitute the macro-financial system of the country, which needs to be managed, regulated and maintained in equilibrium, i.e. in stabilizing this system to ensure the economic security of the country as a whole. In order to ensure the financial stabilization of the country, it is necessary, first of all, to develop and implement a balanced and deep-minded state policy in this sphere. The winner of the Nobel Prize in economics, U. Vickrey, categorically opposed "the obsessive pursuit of politicians for the holy grail of a balanced budget, he said, we must strive not for a balanced labor market." This point of view of the economist can be explained by the fact that in ensuring the financial stabilization of the country one of the strategic factors is human labor, citizen labor, development of the human factor and its assessment, rational use of labor resources, labor, etc. Russian scientist A. Illarionov in the macroeconomic and financial stabilization of the country included the following factors: the critical role of macroeconomic stabilization for economic growth, the quantitative criterion of macroeconomic stabilization, the devaluation of the rate of national currency, inflation, budget deficits, monetary and credit factors, the level of institutional reform and others. A number of other researchers have also studied the foregoing factors and challenges their impact on the country's economic security. So T. Rzhetskaya studied the problems of development of the financial system and the mechanisms of its regulation in the conditions of market transformation [6]. The author believes that in conditions of deep deformation of traditional economic processes and mechanisms in conditions of deepening market relations, the state is obliged to systematically and comprehensively address the problems of the national financial cycle, financial flows, improve the financial system of the country and the tools to regulate financial problems, consider the budget proportionality in aspect of the interaction of the financial system in the implementation

of financial policies, ensuring efficiency and dynamism of budget processes and budget system, determining priority criteria for an effective budget policy, and generally considering all these issues in the context of the national security strategy, F.Yusifov believes that in the process of budget forecasting in the country, along with such major macroeconomic indicators as gross domestic product, unemployment, dark inflation, trade balance, should also more widely use the following macroeconomic indicators: population incomes, capital dynamics italization, forecast estimates of the state of commodity markets and energy [7]. Researchers S.Andryushin and V.Kuznetsova studying the problems of the macroeconomic aspect of financial policy in the new environment, emphasize that the recent financial crisis has stimulated a variety of international theoretical and empirical research, primarily in the financial sphere [1]. They resulted in recommendations to national governments on the optimal combination of macro-financial and macroeconomic policies. The result of a combination of policies should be stabilization of long-term economic growth, the effective functioning of the financial market and adequate pricing of national assets. The authors emphasize the importance of strengthening state financial policy measures to protect public sector money from risks, improving the management of the monetary balance in the whole country, optimizing the use of acceptable levels of accepted risks of fiscal, monetary and credit relations, etc. Antropova, studying the role and importance of financial stabilization in the context of the economic security of the modern state, noted that finances are now the strongest leverage of external control in istemu security of the state [2]. A.Belyaev exploring the features of financial stabilization at the macroeconomic level, emphasizes that structural-production stabilization puts forward the antipode of "shock therapy."

3. CONCLUSION

Financial stabilization acts as a derivative element of industrial stabilization. It is assumed that an active industrial, investment, structural policy contributes to the rapid modernization of the productive forces, ensures cost reduction, quality improvement, strengthening the competitiveness of domestic products and ultimately leads to financial stabilization. Researcher Gadzhieva S.A. studying the relationship of fiscal and monetary policy in national economic development, noted the importance of respecting the financial security of the country, primarily through the scientific development of mechanisms and foreign policy of the financial and tax sphere, identifying threats to subjects and sectors of financial stability, neutralizing the influence of negative factors, ensuring the sustainability of financial development, etc. [3]. Based on the scientific thoughts and results of the above authors, it can be noted that financial stability is a complex and complex set of economic and financial processes that require a comprehensive and fundamental study, development of a balanced state policy, based on the realities and experience of global economic and financial trends, taking into account modern global problems, deformation of the world economic system and other important factors of macro-financial stability and economic safety five countries. As can be seen from the study, financial stabilization of the country covers a number of factors affecting the effective and rational management of financial flows, control over state financial resources, their optimal distribution in the context of globalization and transformation of economic and financial processes. The considered materials allow to summarize the factors influencing the financial stabilization of the country in the following sequence. Factors affecting the financial stabilization of the country internal factors: GDP; unemployment rate; state of the budget and financial system; domestic debt; GDP volume; defense spending; state budget deficit; inflation rate; balance of payments; infrastructure costs; level of development of entrepreneurship and business; reliability of the credit and banking system; volume of foreign exchange reserve. External factors: globalization of world space; trans-nationalization of economic ties; internationalization of the world economy; high concentration of financial resources; the

growing strength of international financial organizations; the intensification of the autonomy of TNCs; increasing mobility and interconnection of financial markets; a variety of international financial arrangements; increased competition between states and groups of countries; increasing the dependence of national economies on the outside world; instability of the global financial system; instability of the global banking system; consequences of global financial crises; strengthening the main currency of the world; political and legal factors; external debt. Analysis of the research materials allows us to group a number of important features and factors affecting the financial stabilization and economic security of the country: the problems of financial stabilization of the country are one of the strategic goals of state economic policy. Therefore, it is necessary to develop and implement comprehensive and systemic measures for financial stabilization and efficient use of public financial resources, it is necessary to carefully and carefully study and systematize external factors that can greatly harm the country's financial stability, the state is obliged to systematically focus on maintaining sources and internal factors financial stability of the country, to ensure the growth of GDP, improve the investment environment, business and infrastructure, entrepreneurial activity, take control of inflation processes and, as necessary, take adequate steps to reduce unemployment, monitor the rational use of public financial resources, budget allocations, etc.

ABSTRACT

The worldwide experience proves a special role and an importance of small and medium enterprises within the national economies. The business sector and especially the Small and Medium-sized Enterprises (SMEs) play an important role in the development of the economy and a significant contribution to the sustainable and inclusive growth. SMEs, having enormous potential in employment generation and job creation, as well as in fostering economic growth, could be considered a backbone of each country's economy. A strong and well-developed SME sector contributes significantly to export, innovation, and creation of modern entrepreneurial culture, playing at the same time a significant role in achieving prosperity in the country. The rise and development of SME's sector is undoubtedly necessary, since it is difficult to imagine the rising of overall standards of living without such development. The purpose of this research is the evaluation of the potential role of SMEs on the future economic growth and development of Azerbaijan. On this research paper the characteristics classifications and roles of SME on different national economies will be analyzed as well.

Keywords: *Importance of SMEs, Small and Medium-sized Enterprises, roles of SMEs, SMEs in Azerbaijan economy*

1. INTRODUCTION

Small and Medium Enterprises are important part of the national economies and, as such as of the world economy. SMEs contribute to employment creation, wealth creation, poverty alleviation and income generation. Usually in advanced economies SMEs constitute the overwhelming share of operating enterprises, generate more than 50% of turnover and provide two out of every three jobs in the private sector. In OECD countries, more than 99% of companies are SMEs and generate about two-thirds of GDP on average (OECD, 2009). However, SMEs in developing countries face numerous impediments, namely, lack of finance, lack of business skills and lack of operating space. In developing countries or in countries in transition, SMEs represent more than 90% of the total number of companies, but their contribution to GDP is generally quite low – in many cases less than 20% (OECD, 2009). The main weaknesses of the SME sector in general are limited access to finance, a low degree of professionalism and existing business schools, difficulties in recruiting qualified personnel, and the absence of economies of scale and it is these areas which may require special attention. By understanding the problems faced by SMEs in Azerbaijan it could be provided the necessary background to develop policies for their support. Different incentive mechanisms aiming to improve the entrepreneurial environment of Azerbaijan have been observed in the last years. Especially after the sharp down of oil prices the government aimed differentiation of economy and decrease impacts of oil price fluctuation. Improving the state's economic basis requires an economic environment where business can prosper. To strengthen and diversify the economy, policy makers and local leaders need to know the characteristics and impact of small businesses on the local economy.

Understanding the characteristics of poverty and the contribution of small businesses to economic growth of the local economy is crucial in designing specific and appropriate development policies. The targets of such policies are to improve and expand community-based capabilities and initiatives in order to assist small communities to retain and expand local small businesses. "The Strategic Roadmap for the production of consumer goods at the level of small and medium entrepreneurship" which signed by the president of country in April 2017 is developed as a part of a nationwide effort to achieve competitiveness, inclusiveness and sustainability in the economy. The main objective of the aforementioned Strategy is to ensure that small and medium entrepreneurship becomes the key enabler for sustainable economic development in Azerbaijan. Also President of Azerbaijan Ilham Aliyev has decreed to create the Agency for Development of Small and Medium-Sized Enterprises under the Ministry of Economy in December 2017. According to the decree, the Agency is a public legal entity that supports the development of small and medium-sized businesses in the country, provides a range of services to the SMEs, coordinates and regulates the services of state bodies in this field. In this research several methods were used simultaneously, including those of description, statistics, comparison, analysis, systematization and generalization. The importance of the SMEs and their role on national economies were analyzed based on various sources of information and statistics. The classification of SMEs were analyzed by the country and region based. Also using systematization and generalization methods were described the potential role of SMEs on Azerbaijan economy and positive impacts on economic development of country.

2. THE ROLE OF SMES ON NATIONAL ECONOMIES

SMEs have a considerably effective role in the development process of national economies and the protection against the negative effects of the global competition especially based on their employment facilities and their flexible structure reacting rapidly to environmental changes. In addition to that, because of their local characteristics that protect the alienation and their roles that strengthen the middle class, SMEs are also important as social perspective. Many authors reasonably consider SMEs as a backbone of the economic development and a key factor of social stability. The contribution of these companies can be summarized in a few key points, as follows:

- a) Small and medium enterprises solve employment problems of the country.
- b) Small and medium enterprises make a significant contribution to the GDP - of the country.
- c) Small and medium enterprises provide a valuable contribution to the development of large enterprises.
- d) Small and medium enterprises make a significant contribution also in export-import of the country.

Authors Scott & Bruce (1987) provided a qualitative definition for SMEs. According to these two authors, SMEs are those enterprises that have the following characteristics:

- Management is independent; usually the managers are also owners
- Capital is supplied and ownership is held by a small group of individuals
- The area of operations of such enterprises is mainly local.
- The enterprise is small when it is compared with the major units in its field.

According to the Organization for Economic Cooperation and Development (OECD, 2000), SMEs represent more than 95% of enterprises and create 60-70% of jobs. Alternatively, the United Nations Industrial Development Organization (UNIDO, 2005) calculated that SMEs account for 90% of private firms and employ 50-60% of the total labor force. SMEs act as the core of economic growth; they generate, to a greater extent, the technical innovation needed for an economy to progress.

Many new jobs come from innovation, and new discoveries bring about even more entrepreneurial adventures. The creativity of small companies is the fuel of the entrepreneurial spirit leading economic growth. A strong and well-developed SME sector significantly contributes to export, innovation, and creation of modern entrepreneurial culture, playing at the same time a significant role in achieving prosperity in the country. SMEs play a unique, active and critical role in the innovation process by their ability to invent new technological spaces and improve high technology information networks (Paul Almeida, 2004).

3. THE CLASSIFICATION AND ROLE OF SMES IN DIFFERENT ECONOMIES: COMPARISON ANALYSES OF EXAMPLE COUNTRIES

There is not a complete definition for SMEs yet. There are used different definitions on various countries, even institutions use different definition, for example the World Bank defines SMEs as enterprises of 300 employees, UNDP defines SMEs as enterprises that can employ up to 200 employees, whereas African Bank uses a threshold of SMEs 50 employees. For comparative analysis, it would be more appropriate to describe the category of small and medium-sized businesses by scheduling different countries and country groups.

3.1. European Union

According to European Commission the small and medium enterprises are classified as enterprises with fewer than 200 employees, with annual turnover of less than 50 million € and a total balance of less than 43 million €. Therefore, the number of employees is the main and the initial criterion for determining on which category is classified an enterprise according to the European Commission.

Table 1: European Union categorization of SMEs. (Commission Recommendation of 6 May 2003 concerning the definition of micro, small and medium enterprises. (2003/361/EC), Official Journal of the European Union, L 124/36, 20 May 2003)

Company Category	Employees	Turnover	Balance Sheet Total
Micro	<10	< €2 million	< €2 million
Small	<50	< €10 million	< €10 million
Medium-sized	<250	< €50 million	< €43 million

Data gathered by the European Commission suggests that SMEs constitutes 99.8% of all businesses and play a significant role in employment by employing two-thirds of the labor force in Europe. The statistics show that SMEs contribute 69% to employment growth and 66.8% to total employment.

Table 2: SMEs and large enterprises: number, employees and value added in the EU28, 2015. (Eurostat, National Statistical Offices, DIW Econ, 2017)

	Micro	Small	Medium	SME	Large	Total
Enterprises	21,256,252	1,378,702	224,647	22,959,600	44,458	23,004,059
Number	92.80%	6%	1%	99.8	0.2	100%
%						
Persons employed						
Number	40,057,408	27,503,428	23,170,352	90,731,192	45,168,732	135,899,904
%	29.50%	20.20%	17%	66.80%	33.20%	100.00%

SMEs play significant role to create value in EU countries economy. Value added by SMEs was 3,938,103 billion EUR, which constituted 57% of total value added by enterprises. However, the contribution of SMEs to GDP of individual countries varies, depending on the political and economic situation of the country concerned (Eurostat, 2017).

3.2. Turkey

SMEs play a significant role in the Turkish economy. The determining factors of a company for categorization by the government include headcount, turnover and balance sheet total, similar to the criteria of the European Union. According to Turkish legislation, small- and medium-sized enterprises are classified as 3 types: micro, small and medium companies.

Table 3: Classification of SMEs in Turkey (The Union of Chambers and Commodity Exchanges of Turkey)

Category	Employees	Turnover	Balance Sheet Total
Micro	<10	≤ 1 million TRY	≤ 1 million TRY
Small	<50	≤ 5 million TRY	≤ 5 million TRY
Medium-sized	<250	≤ 25 million TRY	≤ 25 million TRY

According to the Turkish Statistical Institute, in 2014, there were 2, 677, 00 enterprises and 99.8% of all enterprises in the country were small- and medium-sized enterprises. 73.5% of employment in the country is dependent on the SME sector. Small businesses have a contribution of 53.5 % to value added. They also account for 54.1 % of all wages and salaries, 55% of total investments, 60.1% of total export, 62% of turnover and 24% of total loans. These statistics demonstrate the importance of small- and medium-sized enterprises for the Turkish economy (Turkish, Statistical Institute, 2017)

3.3. Russia

Table 4: Classification of SMEs in Russia (European Investment Bank, Small and Medium Entrepreneurship in Russia, 2017)

	Revenue (mln EUR)	Number of employees
Micro	< 1.5	<15
Small	1.5 – 10	15 – 100
Medium	10 – 25	101 – 250

Small business has been growing in Russia, but medium-sized business declines from the 2010 to 2015 years. The government in Russia decided to double the share of SMEs in the economy by 2030, and, therefore, according to entrepreneurs, it is essential to give public service to outsourcing, limit benefits for municipal unitary enterprises and support freelancers. The Ministry of Economic Development of the Russian Federation is preparing the strategy for the development of small and medium business up to 2030. As the first version of the plan says, the number of people employed by small and medium business should grow to 40 million people (today it is 17.8 million).

3.4. Georgia

Table 5: Classification of SMEs in Georgia (Law of Georgia No. 519 of 12 June 2012, on the Georgian National Investment Agency; Tax Code of Georgia)

Definitions of micro, small and medium enterprises in Georgia				
	Employment		Turnover	
	Definition 1	Definition 2 (for tax purposes only)	Definition 1	Definition 2 (for tax purposes only)
Micro		Self-employed (no hired labour)		≤ 30,000 GEL (12,465 USD)
Small	≤ 20 employees	Self-employed (no hired labour)	≤ 500,000 GEL (207,750 USD)	≤ 100,000 GEL (41,550 USD)
Medium	≤ 100 employees		≤ 1,500,000 GEL (623,250 USD)	

Today, SMEs are the basis of the Georgian economy. SMEs make a significant contribution to Georgia's economy, making up 94,1% of enterprises, 42,7% of employment and 20,6% of value added in 2013 (OECD/European Union/EBRD/ETF, 2015). The role of SMEs is manifested in the fact that it is able to improve early mechanisms to be flexible and adapt quickly to changing conditions of the economy and the market.

4. THE SMES CLASSIFICATION IN AZERBAIJAN

Micro and small and medium sized entrepreneurship in Azerbaijan is divided into two groups: individual entrepreneurs (i.e. sole owners of the enterprise without forming a legal entity); and small- and medium-size enterprises (i.e. legal entities). All individual entrepreneurs are legally considered small enterprises by default, whereas those registered as legal entities are classified according to two indicators: number of employees and annual turnover (CESD, 2012).

Table 6: Criteria of determination of SMEs in Azerbaijan (Azerbaijan Republic Cabinet of Ministers Order June 29th 2016)

Entrepreneurship Category in terms of size	Average Number of Employees (Definition 1)	Average Number of Employee (definition 2) For Tax Purposes only	Annual Revenue Definition 1	Annual revenue Definition 2 For tax purposes only
Small	Up to 25 employees	Self Employed (No hired labor)	Up 200 thousand manat (USD 117647)	Up to 200 thousand manat (Up to 117647)
Medium	Between 25-125 employees		Between 200-1.250 thousand manat (USD 117647 –USD 735294)	
Large	More than 125 employees		More than 1.250 thousand manat (USD 735294)	

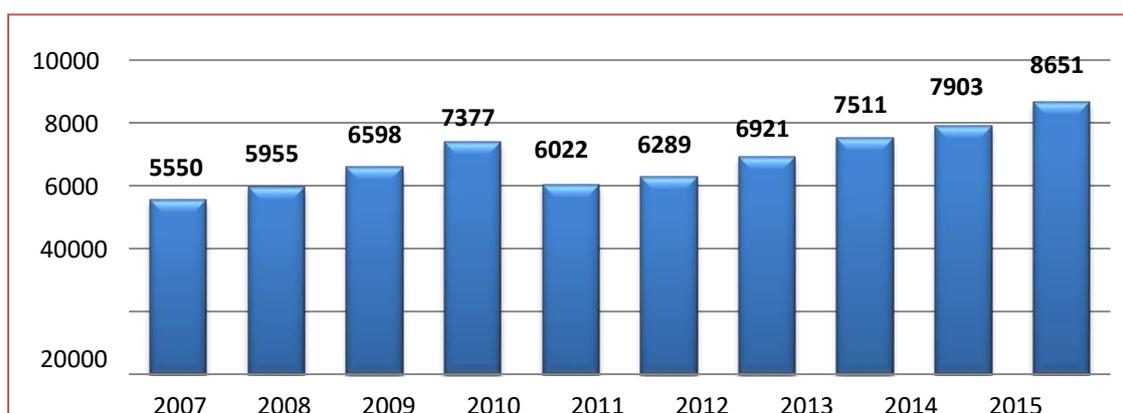

According to the new order, the classification of existing enterprises under the categories small, medium and large is mainly determined by their "average number of employees" and "annual

revenue". If any of the criteria exceed its limits, it causes a change in the classification of the company to the higher level. As for new enterprises, a year after the date of their state registration and tax accounting, small, medium and large enterprises are classified based on their "average number of employees". Also, based on the new order, the overall value of all of the enterprise's goods, activities and services during the course of one fiscal year is added to its annual revenue. When comparing the classification of the European Union, Turkey and in Russian, we can see that the maximum limit for the number of employees required by this type of entrepreneurship in relation to the European Union and Turkey is very small. At the same time, a lower limit has been set in terms of turnover. This is one realistic problem in classification SMEs in Azerbaijan.

4.1. Current situation of SMEs in Azerbaijan

According to the data provided by the Ministry of Economy of the Republic of Azerbaijan for 2016, the number of entrepreneurship subjects in all sectors of the economy were numbered 792,764. As it turns out, in 2016, the number of entrepreneurship subjects increased by 77,179, as compared to 2015. According to given indicators, 36.1% of total entrepreneurs were registered in the city of Baku and 63.9% in other regions of the country. Small enterprises have seen further development under market relations. Generally, according to the indicators of 2016, the majority of all enterprises in the country were small enterprises (86,517 units), it is clear that the number of small enterprises in 2016 has increased by 7,477 units, compared to 2015.

Figure 1: Number of small enterprises in Azerbaijan (The Republic of Azerbaijan Ministry of Economy, 2017)

According to official statistical data, the share of small entrepreneurship entities in the non-oil sector was 5.8% of value added, 0.7% in total gross profit, 6.5% in annual average employees and 9.2% in fixed capital investments. The diversification and development of the non-oil sector is one of the key priorities in the development plans of the government of Azerbaijan. In this vein, the government has implemented a number of reforms in order to support SMEs. However, as compared to developed countries, the shares of SMEs in value added for the Azerbaijani economy is relatively low. While SMEs contribute more than 50% of value added in developed countries, for Azerbaijan, this figure equals only 4%.

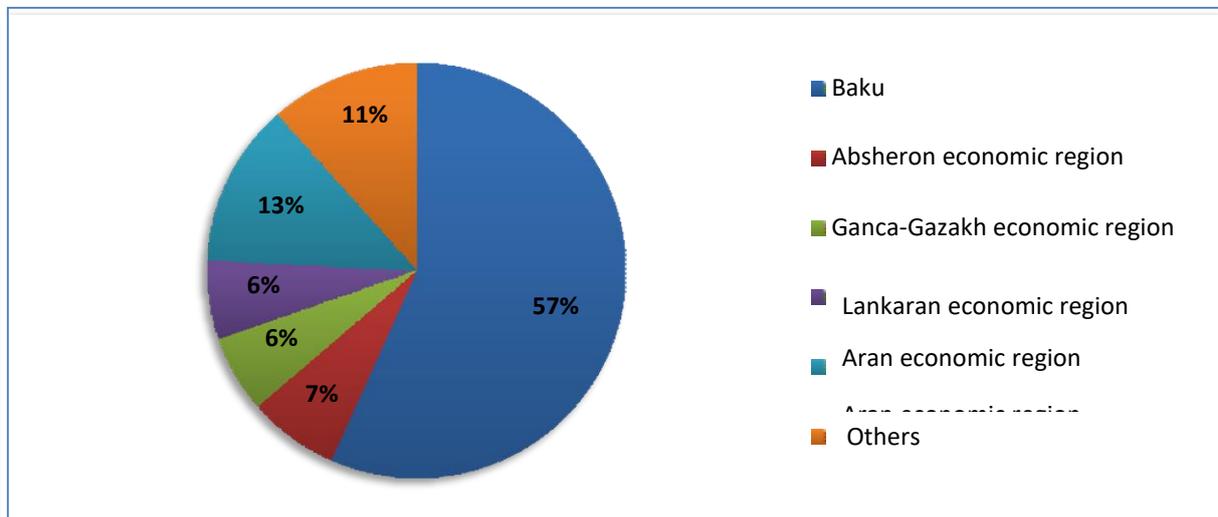

Table following on the next page

Table 7: Share of small entrepreneurship subjects in the economy of the country at percentage (The State Statistical Committee of the Republic of Azerbaijan, <https://www.stat.gov.az/source/entrepreneurship/?lang=en>)

	2007	2008	2009	2010	2011	2012	2013	2014	2015
Value added	1,6	1,8	2,6	2,8	2,6	2,7	2,7	2,6	4,0
non oil sector	4,2	4,7	5,1	5,2	5,3	5,2	4,8	4,3	5,8
Gross surplus	0,2	0,2	0,3	0,2	0,3	0,4	0,6	0,7	...
non oil sector	2,7	2,3	2,9	3,0	3,0	3,3	3,5	3,5	...
Average annual number of employees	6,7	7,3	7,6	6,7	6,5	6,4	7,9	7,6	6,3
non oil sector	6,9	7,5	7,8	6,9	6,7	6,6	8,1	7,7	6,5
Investments directed to fixed capital	3,9	3,7	3,7	2,8	5,8	3,5	2,7	4,2	5,1
non oil sector	7,3	5,3	5,1	4,0	7,6	4,6	3,8	6,4	9,2
Turnover	4,2	4,5	6,1	8,6	8,1	9,6	10,6	10,5	9,6
non oil sector	7,7	8,4	9,8	15,6	18,3	18,5	20,0	18,4	14,9

Large shares of small enterprises are mainly located in Baku (56.7%), as can be seen in Figure 2. The main reason is that most of the population is concentrated in Baku and, compared to other economic regions or cities, the majority of economic activity is carried out in Baku. The economic regions where small enterprises are mostly located, after Baku, are Aran (13%) and Absheron (7%).

Figure 2: Distribution of small enterprises by economic region in (The State Statistical Committee of the Republic of Azerbaijan, 2017)

In economy, the largest share in the distribution of small entrepreneurship subjects belongs to retail trade, at 49% of small entrepreneurship subjects. After retail trade, 15% belonging to the transportation sector, 7% to accommodation and food service activity, 2% to industry and agriculture, 1% apiece to construction and real estate activities and, finally, 23% belongs to other fields. The major reason is production spheres have been more weakly developed than consumption spheres in the economy of the country. Other reasons are that: the monopoly in retail trade has been weak and the initial capital requirement is small in the retail trade, therefore citizens have more opportunities to engage in entrepreneurial activity in the retail trade area.

*Table 8: Distributions of small entrepreneurship subjects
 (by kinds of economic activity, at percentage)
 (The State Statistical Committee of the Republic of Azerbaijan, 2017)*

	2008	2009	2010	2011	2012	2013	2014	2015
Total economy	100	100	100	100	100	100	100	100
of which:								
agriculture, forestry and fishing	2,0	2,0	1,9	1,7	1,6	1,5	1,8	1,8
industry	2,3	2,3	2,2	2,0	1,7	2,0	3,4	2,3
construction	1,1	1,1	0,7	0,7	0,7	0,8	1,2	1,1
trade; repair of transport means	64,6	64,2	64,6	70,2	71,7	70,1	49,1	49,3

other fields	11,4	11,6	12,7	11,7	10,1	10,6	21,2	22,6

4.2. Historically overview of SME development policies in Azerbaijan

Over the past period of time, Azerbaijan has taken several actions to support the development of entrepreneurship. Under the Presidential Decree № 610, dated on 24 June 1997, and № 753, dated on 17 August 2002, “State program for the support of small and medium entrepreneurship in the Republic of Azerbaijan (1997 – 2000 years)” and the “State Program on development of Small and Medium Entrepreneurship (2002 - 2005 years)” were adopted and implemented accordingly. In addition, the following programs contain actions for the development of entrepreneurship, further improvement of favorable business environment, improvement of mechanisms for the protection of the entrepreneurs’ rights and statutory interests: “State Program on reliable food supply of population in the Republic of Azerbaijan in 2008 – 2015 years” approved by the Presidential Decrees № 3004, dated 25 August 2008 and № 3043, dated 15 September 2008 and “State Program on poverty reduction and socio-economic development in the Republic of Azerbaijan in 2008 - 2015 years”, as well as 5 “State Program on socio-economic development of regions of the Republic of Azerbaijan in 2014 – 2018 years” approved by the Presidential Decree № 118, dated on February 27, 2014 and “State Program on the development of industry in the Republic of Azerbaijan in 2015 – 2020 years” approved by the Presidential Order № 964, dated on December 26, 2014.

4.3. The Strategic Roadmap for the production of consumer goods at the level of small and medium entrepreneurship

“The Strategic Roadmap for the production of consumer goods at the level of small and medium entrepreneurship” is developed as a part of a nationwide effort to achieve competitiveness, inclusiveness and sustainability in the economy. The main objective of the aforementioned Strategy is to ensure that small and medium entrepreneurship becomes the key enabler for sustainable economic development in Azerbaijan (Center for Analyses of Economic Reforms, 2017).

Development of SMEs in Azerbaijan is essential to facilitate economic diversification, increase competitiveness, employment, as well as to meet demand for consumer goods and ensure economic development using local resources. The Strategic Roadmap sets the primary policy direction for short, medium and long term perspectives of economic reforms and development of the SMEs. This document consists of the strategic vision for 2020, long term vision for 2025 and target vision for post-2025 period for Azerbaijan. In addition to describing the development strategies in the Strategic Roadmap and strategic objectives and targets in the action plan for 2016-2020, they also define a series of priorities to achieve objectives set for these years, as well as actions to be implemented under each objective, key implementers and clear-cut deadlines. The effective implementation of the selected priorities in the short term will ensure focused and effective execution, which will lay foundation for further efforts in medium to long term. The following were set as strategic targets for the development of the SME in the country in order to achieve relevant strategic objectives of the Strategic Roadmap and ensure maximum utilization of available potential: (Center for Analyses of Economic Reforms, 2017):

- To further improve business climate and regulatory framework in the country in order to increase SME's contribution to Azerbaijan's GDP in the long run;
- Ensure efficient and cost-effective access to financial resources in order to establish sustainable network of the SMEs;
- Internationalize the SME's activity and increase access to international markets in order to increase currency stocks and bring domestically produced products into line with international standards;
- Increase supply of high-quality products and services in regional markets with special emphasis on training of skilled labor force and improvement of skills of the SMEs;
- Promote innovations to boost competitiveness of the SMEs and strengthen research and development in this field.

Particular attention will be paid to strengthening stimulatory impact of financial and tax policies by introducing improved legislative framework governing the SME-related issues, increasing access to financial resources, strengthening technical and information basis, as well as area-based optimal placement of SMEs in the country, protecting domestic market, developing market infrastructure, introducing "single window" approach for issuance of necessary documents, reinforcing joint work among entities representing this sector, etc. Realization of these strategic targets will bring AZN 1 260 million added value and 34,240 jobs in the sector (Center for Analyses of Economic Reforms, 2017).

4.4. The main strategies and targets of Strategic Roadmap

The strategic vision of Azerbaijan for the development of the SMEs by 2020 is to achieve further improvement of business environment, simplified access for SMEs to financing opportunities and trade markets and ensure competitiveness, as well as increased contribution of the SMEs to economic development bringing up their business knowledge and skills. Azerbaijan' long-term vision for 2025 is to further improve competitiveness of the SMEs, achieve supply of substantial portion of daily consumer products by the SMEs and give rise to significant SME contribution to the country's GDP and employment.

Strategic objectives in SME sector are the followings:

- Shape more favorable business environment for SME;
- Increase competitiveness and role of the SMEs in the economy;
- Ensure that all major parts, particularly intellectual part of works and services are provided through the development of SMEs and consequently, the innovations;
- Increase the SME contribution to employment;
- Ensure that key consumer goods are produced by small and medium enterprises;

- Increase share of the SME export in the overall export of the country.

The Strategic Roadmap for small and medium entrepreneurship identifies 5 strategic targets, with relevant priorities for each strategic target. These can be classified as below (Center for Analyses of Economic Reforms, 2017):

- Improve favorable business environment and regulatory framework for the operation of the SMEs;
- Ensure cost-effective and efficient access to financial sources for the SMEs;
- Internationalization of the SMEs and improvement of their access to foreign markets;
- Increase knowledge and skills of the SMEs and accelerate the introduction of best practices;
- Expand promotion of investments, research and development activities for the SMEs.

The target indicators of Strategic Roadmap (Center for Analyses of Economic Reforms, 2017):
The followings are expected to result from the implementation of priorities in the SME sector:

- Increase the SME contribution to GDP by 15 percent;
- Increase the SME contribution to employment by 20 percent;
- Increase the SME contribution to non-oil export by 10 percent;
- Increase GDP by AZN 1 billion 260 million in 2020, in real terms;
- Create additional 34240 employments in 2020.

The following key performance indicators have been identified for measures towards the development of SME:

- Increase the SME contribution to products produced within industrial clusters by 40%;
- Improve by 2 times the rate of dispute settlements among SMEs before court procedures;
- Increase recovery rate of the SMEs (from insolvency) by 4 percent;
- Increase by 2 times the indicators of admission of immovable property as collateral by banks;
- Increase share of leasing transactions in GDP by 2 percent;
- Achieve 5 percent increase in non-oil exports;
- Establish 3-5 model entities;
- Establish 5 new business incubators;

For the implementation of this strategy roadmap, President of Azerbaijan Ilham Aliyev has decreed to create the Agency for Development of Small and Medium-Sized Enterprises under the Ministry of Economy in December 2017. According to the decree, the Agency is a public legal entity that supports the development of small and medium-sized businesses in the country, provides a range of services to the SMEs, coordinates and regulates the services of state bodies in this field. A permanent coordination group has been established under the Agency for Development of Small and Medium-Sized Enterprises (SMEs) of Azerbaijan. The decision was made by the Cabinet of Ministers of Azerbaijan with the aim of implementing paragraph 6.14 of the decree of the President of Azerbaijan, Ilham Aliyev, "On ensuring the activities of the Agency for Development of Small and Medium-Sized Enterprises" dated June 26, 2018. According to the decree, the task of the Coordinating Group will be to coordinate the business development policy, ensure the efficiency and effectiveness between state institutions and the agency while providing services to SMEs (Trend News Agency).

5. CONCLUSION

Small and Medium Enterprises play a very significant role in national and world economy. Accordingly, all world countries support SMEs via different promotion mechanisms.

Regarding to this research, we can assume that SMEs play enormous role in socio-economic indicators of each country. SMEs another significant role is to promote establishing competitive economy in a country. Another impact of SMEs is support of diversification of economy. As an emerging country, Azerbaijan has great potential to benefit from the synergies created by SMEs. The research demonstrates the development of SMEs in Azerbaijan is not at the desired level, and their share in economic growth and employment is much smaller than in other developed and emerging economies. In developed countries, 98-99% of total enterprises are small- and medium-sized enterprises. Although in developing countries such as in Turkey and Russia, this figure is smaller, they still take an important place in the national economy. In regard to Azerbaijan, in the country, 83.30% of total enterprises are small enterprises, but only 4% of the added value of the country belongs to SMEs. The strategic target for 2020 year is increase this figure from 4% to the 15%, but it is still low than other countries. For comparison, value added about 57% in the European Union, 43% in Georgia. At the same time, considering that SMEs are non-oil sector units, then it is important to accelerate and expand diversification across the sectors in the economy. The share of SMEs in production areas is relatively low while 1.8% of SMEs are engaged in agriculture and 2.3% in industry. 49% of Azerbaijani SMEs are concentrated in wholesale and retail trade. These figures shows that it is a potential for diversification and development SMEs in all sectors of economy. There are several hindering constraints in development SMEs in Azerbaijan and all these constraints are mentioned in Strategic roadmap for production consumer goods as level SMEs. These constraints are: the high level of centralization of SMEs specially in capital of republic. Access to finance is one of the most rigid problems in Azerbaijan for SMEs; specially after the devaluation of national currency. Other problems of SMEs are: limited access to markets, legal constraints and a lack of entrepreneurial skills. For the conclusion, we can mention that although SMEs have not developed properly in Azerbaijan, certain steps are already being taken to change this – these steps are mainly related to the simplification of business registration procedures and improvement of tax administration. However, based on statistical indicators, we can say that these steps are still not satisfactory and through taking advantage of world experience, it is necessary to implement more incentive methods. And for these reasons the Agency for Development of Small and Medium-Sized Enterprises can play a significant role in development SMEs in Azerbaijan. In the case of sustainable and productive activities towards the strategic targets set out in the Strategic Roadmap for consumer good as level. SMEs, the importance of SMEs in the economy will increase in Azerbaijan. And all these developments will have a positive impact on macroeconomic indicators of country.

ABSTRACT

One of the most important problems of resource-rich countries is Dutch disease whose main feature is the appreciation of the domestic currency that reduces the competitiveness of tradable sector and redirects resources from tradable sector to the natural resource and non-tradable sectors which in turn results in increase in non-resource trade deficit. Paper considers different ways to mitigate Dutch disease effects in terms of efficient allocation of resource and argues that: 1) reduction in profit tax rate is preferable to other ways of neutralizing Dutch disease, 2) as selective support for certain sectors leads to misallocation of resources, reduction in profit tax should extend to all producers and not just to tradable sector.

Keywords: *currency appreciation, Dutch disease, effective resource allocation, profit tax*

1. INTRODUCTION

A well-functioning economy should be able to promote efficient allocation of resources. Effective resource allocation means a shift of resources from low- to high-efficient firms that promotes increase in competitiveness of economy and sustainable economic growth. Thereby when we talk about resource misallocation, we mean a shift of resources not only from high- to low-efficient firms, but also shift of resources from tradable to non-tradable sector, if this causes deterioration in trade balance. One of the obstacles to the efficient allocation of resources is Dutch disease. Simply put, Dutch disease refers to the currency appreciation caused by natural resource boom that reduces the competitiveness of tradable sector and causes resources to shift to natural resource and non-tradable sector, which in turn results in increase in non-resource trade deficit. Bresser-Pereira (2008) argues that Dutch disease is a market failure that implies a more appreciated exchange rate than the one that would be necessary to make competitive the tradable industries, and only when the Dutch disease is neutralized will the market be able to effectively allocate resources. However policy against Dutch disease also can negatively affect efficient allocation of resources. Paper considers different ways to mitigate Dutch disease effects in terms of efficient allocation of resource and argues that: 1) reduction in profit tax rate is preferable to other ways of neutralizing Dutch disease, 2) as selective support for certain sectors leads to misallocation of resources, reduction in profit tax should extend to all producers and not just to tradable sector.

2. DUTCH DISEASE: CURRENCY APPRECIATION, RESOURCE ALLOCATION, AND NON-RESOURCE TRADE DEFICIT

Dutch disease is the chronic overvaluation of a country's currency caused by exploitation of abundant natural resources that reduces the competitiveness of non-resource tradable sector and results in shift of resources from non-resource tradable sector to natural resource and non-tradable sector, which in turn results in non-resource trade deficit. There is much literature on Dutch disease.

Early studies include Corden (1981), Bruno and Sachs (1982), Corden and Neary (1982), Haberger (1983), Edwards and Aoki (1983) and van Wijnbergen (1984). Corden (1981) shows how revenue from natural resources results in appreciation of the domestic currency that negatively affects tradable sector. Corden and Neary (1982) have stressed that Dutch disease is a structural phenomenon that provokes shift of resources from manufacturing to the booming natural resource sector. Natural resource boom provokes also shift of resources to non-tradable sector. It is caused by the fact that natural resource boom raises incomes per capita, and as demand for service (particularly housing, health and recreation) is income elastic compared to manufacturing goods (Fisher, 1935; referenced by Maroto-Sanchez, 2010, p. 8; Falvey, Gemmell, 1996), increase in income per capita leads to fast growth of demand for non-tradable service compared to tradable goods that causes resources to shift to non-tradable sectors. Edwards and Aoki (1983) also show that as commodity export boom causes decrease in the relative price of other (traditional) tradable goods both in terms of booming commodity and non-tradable goods, resources move out of traditional tradable sector into non-tradable and commodity sectors. Bresser-Pereira (2008) argues that Dutch disease is a market failure because natural resource boom generates a negative externality on the economy's other sectors, preventing those sectors from developing. He stresses that Dutch disease is a market failure that implies a more appreciated exchange rate than the one that would be necessary to make competitive the tradable industries, and only when the Dutch disease is neutralized will the market be able to effectively allocate resources. Botta (2014) stresses that currency appreciation caused by the expanded export of natural resources results in decrease in manufactured goods exports and gives rise to a widening manufacturing trade deficit.

3. POLICIES FOR MITIGATING DUTCH DISEASE EFFECTS AND RESOURCE MISALLOCATION

Researchers suggest different ways to neutralize Dutch disease.

- not spending the revenues from natural resources domestically and acquiring foreign financial assets (Harberger, 1983; Bresser-Pereira, 2008, Larsen, 2004);
- levying export tax on natural resources (Bresser-Pereira, 2008);
- production and export subsidy to the tradable sectors (Bresser-Pereira, 2008; Magud and Sosa, 2010);
- import duties (Bresser-Pereira, 2008);
- transferring a revenue from natural resource to the population and then taxing them (Devarajan et al., 2011);
- reduction in profit tax (Corden, 1981).

Consider above-mentioned ways of neutralizing Dutch disease in terms of efficient resource allocation.

- Not spending the revenues from natural resources domestically and acquiring foreign financial assets. This policy allows avoiding currency appreciation but it doesn't prevent labor misallocation. Firstly, increase in resource sector compared to other sectors leads to increase in resource sector's share of labor. Secondly, increase in wage in resource sector compared to other sectors further contributes to the shift of labor to resource sector. Thirdly, resource boom leads to increase in demand on labor that causes growth of wage in the whole economy; but wage growth in non-resource tradable sectors relative to productivity growth results in deterioration of their competitiveness that causes deindustrialization and deterioration in non-resource trade balance.
- Levying export tax on natural resources. Export tax restricts the development of natural resource sector and hence promotes the shift of resources to manufacturing. However tax on natural resource increases government revenue, and if natural resource revenue is used

to finance public expenditure, currency appreciates, and if increase in public expenditure doesn't contribute to rise in firms' efficiency, currency appreciation negatively affects non-resource trade balance.

- Production and export subsidies to the tradable sectors. A subsidy allows firms to partially offset the production costs and thereby to mitigate the negative effect of currency appreciation on competitiveness. However if among firms receiving subsidies there are unprofitable firms, this policy prevents resources from being transferred from inefficient into efficient firms, and thus cause resource misallocation.
- Import duties. Like subsidy, import duties allow domestic firms to mitigate the negative effect of currency appreciation on competitiveness. However, as along with efficient firms, unprofitable firms also take advantage of import duties, this policy also prevents shift of resources from inefficient into efficient firms, and thus causes resource misallocation.
- Transferring a revenue from natural resource to the population and then taxing them. It is assumed that government spending that is financed by taxation—rather than by resource revenues accruing directly to the government—is more likely to be scrutinized by citizens and hence subject to greater efficiency. However this policy results in increase in non-resource trade deficit as spending of the revenues from resources domestically causes currency appreciation and deterioration of firms' competitiveness, and therefore increase in consumer spending caused by growth in income of the population encourages more imports rather than domestic production.
- Reduction in profit tax. Resource revenue may allow the country to reduce profit taxes and thus neutralize the negative effect of currency appreciation:
 - firstly, post-tax profits of producers may rise even though pre-tax profits have fallen;
 - secondly, reduction in profit tax reduces firms' cost that allows firms to offset increase in wages caused by natural resource boom;
 - thirdly, reduction in profit tax allows firm to increase investment in fixed capital that also will positively affect their competitiveness.

Thus, reduction in profit tax allows firms to mitigate the negative effect of currency appreciation on competitiveness of tradable sector. However, unlike other way of supporting tradable sector, unprofitable firms cannot take advantage of reduction in profit tax that encourages resources to move out of the inefficient firms. Thereby reduction in profit tax allows avoiding resource misallocation that makes reduction in profit tax preferable to other ways of neutralizing Dutch disease. Moreover, as selective support for certain sectors leads to misallocation of resources, reduction in profit tax should extends to all producers and not just to tradable sector.

4. CONSLUSION

Currency appreciation caused by natural resource boom results in resource misallocation. Dutch disease causes resources to shift from tradable sector to non-tradable sector that results in non-resource trade deficit. Paper considers different ways to mitigate Dutch disease and argues that in terms of efficient allocation of resource, reduction in profit tax rate is preferable to other ways of neutralizing Dutch disease. Thus, reduction in profit tax increases post-tax profits of producers, reduces firms' cost and encourages investment in fixed capital that allows firms to mitigate the negative effect of currency appreciation on competitiveness of tradable sector. However, unlike other way of supporting tradable sector, unprofitable firms cannot take advantage of reduction in profit tax that encourages resources to move out of the inefficient firms. Moreover, as selective support for certain sectors leads to misallocation of resources, reduction in profit tax should extends to all producers and not just to tradable sector.

ABSTRACT

In the current economic situation, at a time of limited resources and opportunities, as well as the number and severity of unresolved social and economic problems, the possibility of using the theory of "growth poles" is increasingly relevant. "Growth poles" ("points of economic growth") are agglomerations of enterprises, productions concentrated territorially and allocated by intensive innovative processes. Determination of the most perspective branches of development of regions, levels of development of branches promote increase of efficiency of strategic planning of the region, and also specific orientation of investment activity within area. Due to the limited budget, it is necessary to determine the unstable sectors of the region, as well as the development prospects characteristic of the region, for the implementation of support and regulation. The relevance of the topic is due to the fact that the formation and effective functioning of "points of growth" is increasingly approved as one of the key instruments of regional development policy, as well as the development of individual territories. The increase in the effectiveness of the measures proposed by the government, as well as the formation of an effective investment policy contributes to a clear definition of the main promising sectors of the regions, i.e. the "growth poles" of the regions. Determining the goal of creating a pole of competitiveness is the key to its further effective development. The pole of competitiveness is aimed not only at the development of enterprises and companies included in it, but also at the comprehensive development of the territory in which it is located. Clearly defined boundaries of creating a pole of competitiveness allow us to determine the structures that will control its activities. Lack of control often leads to inappropriate and inefficient public financing and hinders the development of the competitiveness pole. In the work considered two methods for determining the major growth poles: the first approach is based on the basis of determining the competitiveness of industries, the second approach is characterized by the determination of the structural elasticity of production in the region. Main results: the concept of "growth poles" for the region is characterized, as well as the algorithm for determining the promising growth poles is considered, the main promising industries are identified, as well as

the level of development of each of the industries at the present time, the model of unique competencies of the region is presented, which will allow to identify interregional poles of competitiveness growth and develop strategies for spatial development of the region. The main methods used in writing the work are: comparative analysis, monitoring, historical and political science, the method of constructing scenarios, correlation and regression analysis.

Keywords: *information technology, information, socio-economic development, region*

1. INTRODUCTION

Unstable political situation in the world, destabilization of the world economy and the country's economy in particular due to the introduction of sanctions load - these factors influence the state and regional policies in the field of import substitution and increase the level of regional self-sufficiency, and, consequently, accelerate the socio-economic development of the regions. The foundations of interregional cooperation were laid back in the 18th century in the theories of absolute and relative advantages A. Smith and D. Ricardo. The classical theories of location made a significant contribution to the formation of the theory of interregional interaction: the theory of localization (I. Thünen), the theory of central places (V. Kristler), the theory of industrial standard (A. Weber and V. Launhardt), the theory of spatial economic balance (A. Lesh) et al (Serebryakova, S. V., 2009, p. 256-260). Since the middle of the last century, against the background of a sharp increase in world trade, an increase in competition between countries and regions, theories developed that reveal the nature of interregional trade, reveal the nature of interregional trade and the competitive advantages of certain territories in it (M. Porter, P. Krugman). Among Russian economists who have obtained the most significant results on the problems of interregional economic interaction, it should be noted A. Granberg, P. Minakir, N. Kolosovsky, A. Tatarkin and others (Granberg, A. G., 2000, p. 76.). The issues of interregional cooperation were addressed by such scientists as N.P. Zhuk, L.V. Ivanovsky, M.Yu. Makhotaeva, V.V. Okrepilov, K.V. Pavlova, T.V. Terentyev. The development of interregional cooperation has an impact on the development of regional industries - the expansion of sales markets, an increase in the level of resource supply as a result of agreements between regions, and the creation of so-called competitiveness poles in the region. The creation of the poles of competitiveness (growth) was first used in France since 2005 in order to enhance the integrated and innovative development and competitiveness of the country. In Russia, given the strategic policies of the country and regions, this experience in creating poles of competitiveness is highly relevant. In the framework of writing the work, such methods were used as: comparative, graphical, tabular, logical, method of multidimensional comparative analysis, as well as economic-statistical method. The data of the Territorial body of the Federal State Statistics Service for the Belgorod Region and the Federal State Statistics Service were used as data for analysis.

2. INTER-REGIONAL COOPERATION REGIONAL

Over the past years, the Belgorod Region has been among the steadily developing subjects of the Federation. In the structure of the gross regional product, the main economic activities are manufacturing (34%), agriculture (22%), wholesale and retail trade (12.6%) and mining (9.7%) (Corporation development. Belgorod region. URL:<http://belgorodinvest.ru> (in Russian)). Belgorod Region is a region secured by one third of Russia's iron ore reserves, industrial production in the field of mining and metallurgy is represented by such companies as: OAO Oskolsky Electrometallurgical Plant, OAO Lebedinsky GOK, OAO Stoylensky GOK, OAO Kombinat KMAruda ", ZAO Belgorodsky Cement, etc. On a nationwide scale, the region produces (Fig. 1):

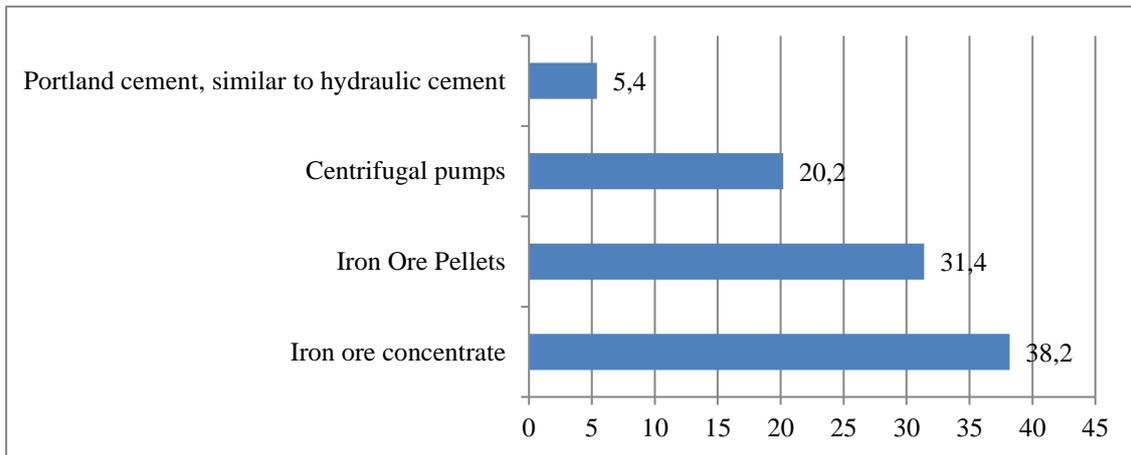

Figure 1: The share of the metallurgical industry of the Belgorod region on a national scale, % (Federal state statistics service. URL: <http://www.gks.ru>)

The machine-building complex of the region is represented by the production of finished metal products, machinery and equipment, electrical equipment, electronic and optical equipment, vehicles and equipment. Along with the mining and metallurgical industries, the basis of the regional economy is the food industry and agriculture. The land area of the region is 2713.4 thousand hectares, more than 70% of which is black earth soil. The region occupies in the Russian Federation:

- 4th place in terms of agricultural production;
- 1 place in the production of meat;
- 1 place in the production of feed;
- 4th place for the production of eggs;
- 2nd place in the production of soybeans;
- 6th place in the gross yield of sugar beet (Vladyka M.V., Kogteva A.N., Kuprijanov S.V., Kulik A.M., Gerasimova N.A., 2018, 1583-1591).

Mutually beneficial interregional relations of the Belgorod region are strengthened every year. Within the framework of interregional cooperation in the territory of the Central Federal District, the Association of Economic Cooperation of the Subjects of the Russian Federation of the Central Federal District "Central Chernozemnaya" functions, which includes the Belgorod Region. Currently, the Government of the region has signed agreements on trade, economic, scientific and technical cooperation with both the regions of the Central Black Earth Region and other regions of Russia. The conclusion of such agreements provides a legal and organizational basis for comprehensive cooperation, the main forms of which are trade, cooperation and the exchange of investments and innovations. To analyze the competitiveness of the industries of the Belgorod region, we consider the export of products outside the territory of the Belgorod region to the subjects of the Russian Federation. The export of products to the territory of the Russian Federation from the Belgorod Region is dominated by products of the ferrous metallurgy and agriculture. Products manufactured in the region, in accordance with scientifically-based consumption rates, in addition to 1 million 552.9 thousand Belgorod residents, Belgorod Region provides:

- 43.2 million people. pork;
- 25.8 million people. poultry meat;
- 36.3 million people. vegetable oil;
- 17.9 million people. sugar;
- 0.5-3 million people. individual groups of vegetables.

When considering interregional commodity exchange of the Belgorod region in terms of the destination of moving goods, it should be noted that its main part is the production of consumer goods (tab. 1).

Table 1: The structure of the export of food from the Belgorod region (Federal state statistics service. URL: <http://www.gks.ru>)

product name	year		
	2014	2015	2016
Meat and poultry, tons	634113	650468	626181
Canned meat, thsd. pack	39,3	96,6	250
Sausages, tons	14146	17678	18411
Cheese and cheese products, tons	1107	1814	2119
Butter, tons	4156	4924	4756
Vegetable oil, tons	83231	75582	167190
Sugar, tons	373605	386488	412463
Flour, thousand tons	143	113	113
Cereal, tons	400	1524	646

It should be noted that for 2014-2016, the export of practically all main goods from the region to the regions of the Russian Federation increased in physical terms. Moreover, the highest growth rates were characteristic for the export of agricultural products. Supply of ferrous metallurgy products to the regions of the Russian Federation has also increased. A decrease was observed only in sales volumes of mineral fertilizers. Noteworthy is the fact that industrial enterprises of the region are gradually reorienting the direction of their supplies from foreign markets to domestic ones. The buyers of products manufactured by enterprises of the Belgorod Region are mainly the regions of the Central and Volga North-West Federal Districts. The development of foreign economic cooperation and export growth is an important task in the development of the Belgorod region. Consider the export structure of the Belgorod region in Fig. 2

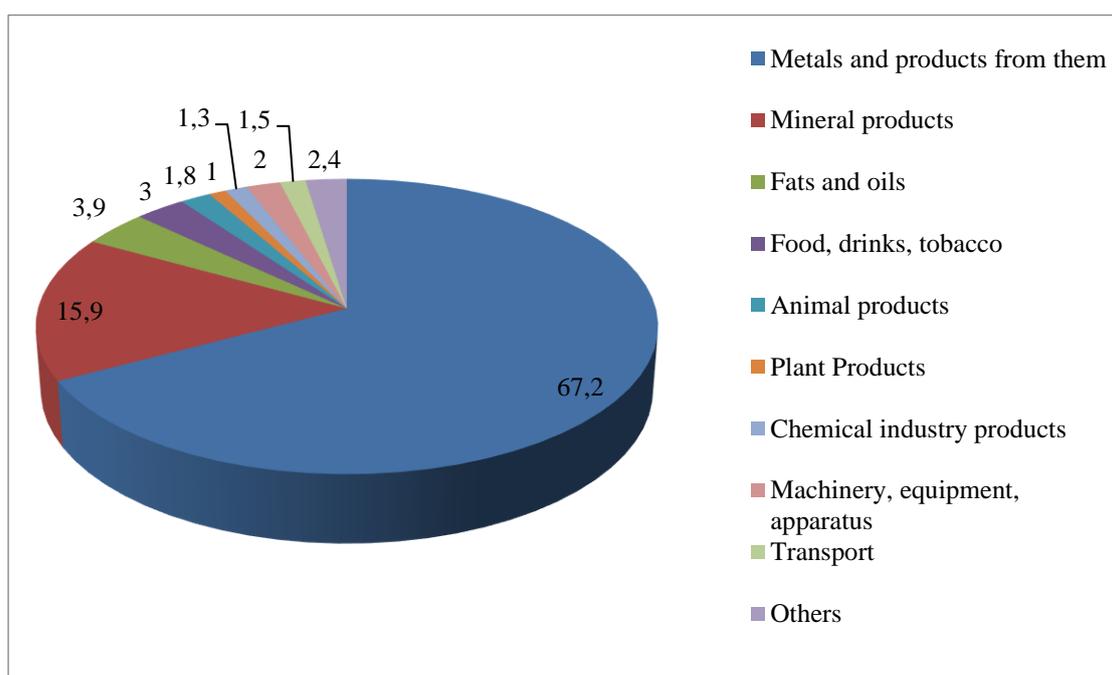

Figure 2: Export structure of the Belgorod region in 2014-2017, % (Federal state statistics service. URL: <http://www.gks.ru>)

Under the conditions of the sanction load, the development of production associated with the extraction of minerals is most relevant. In the structure of exports of the Belgorod region for the period 2014-2017, the dominant share of metals and products from them (67.2%), mineral products account for 15.9%. As a region with an agricultural focus, in the export structure, the Belgorod region also has agricultural products and products of its processing - fats and oils (3.9%), food products and beverages (3%), vegetable products (1.3%) and animal origin (one %). The Belgorod region currently exports to 126 countries of the world; the largest exporting countries are: Turkey (12.6%), Ukraine (10.8%), Italy (9.1%), Egypt (5.7%), Kazakhstan (5.4%), Germany (4.7%), Belarus (4.7%) (Vladyka M., Vaganova O., Solovieva N., 2017, p. 95)

3. THE IDENTIFICATION OF POLES OF REGIONAL COMPETITIVENESS

Identifying the poles of a region's competitiveness cannot be based only on an analysis of inter-regional interaction. In order to clarify the conclusions made in this paper, we consider the poles of competitiveness on the basis of data from the internal activities of the region. Poles of competitiveness are enterprises with a strong production strategy and a high level of profitability. Consider the level of profitability of enterprises of the Belgorod region in Fig. 3

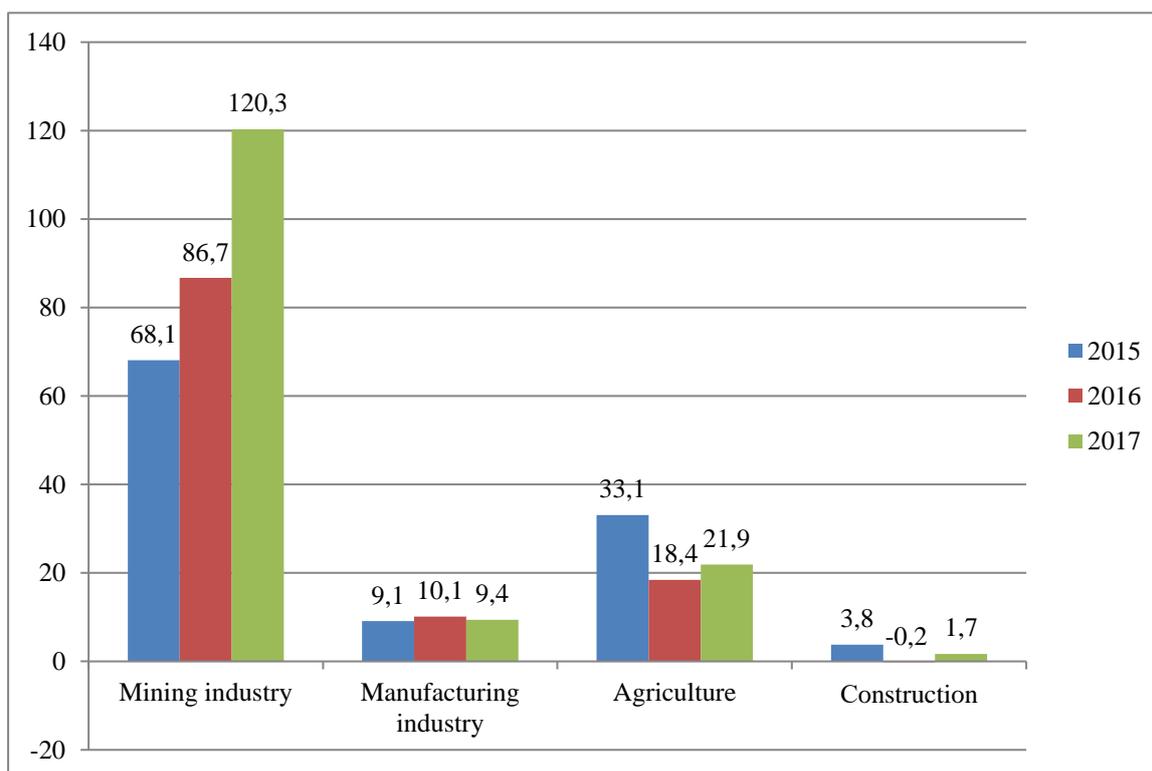

Figure 3: The level of profitability of industries of the Belgorod region
 (URL:<http://belgorodinvest.ru>)

According to the figure, it can be concluded that the most profitable in the Belgorod region is the mining industry, which has the highest level of profitability. The agricultural industry also demonstrates positive values of profitability, while there is a noticeable trend towards a decrease in the value of the indicator in 2016, with an increase in 2017. According to the method of L. Dedov, on the basis of calculations of the conservative component of the growth rate and the reconstructive component of the growth rate, established by us in previous works, we consider the phases of economic development of the main branches of the region in Table 2.

Table 2: Phases of economic development of branches of the Belgorod region (Federal state statistics service. URL: <http://www.gks.ru>)

	Mining industry	Manufacturing industry	Agriculture	Construction
2015	5	3a	6	1
2016	1	1	3a	5
2017	1	5	3a	6

According to the table, it can be concluded that the industries with dynamic development in the Belgorod region are the mining industry, which has a transition $4 \rightarrow 1$. Agriculture, which is developed according to the law of Griffen, is also a promising sector of the region, while the introduction of import substitution policies in the country has an impact on the development of this sector. Thus, summarizing the above, we can say that the main poles of competitiveness for the Belgorod region are the mining industry and agro-industrial production, which is closely connected with the processing industry of the region. It should be emphasized that among the solved problems of each specific modern optimization inter-sectoral interregional model (OIIM) are (Fig. 4):

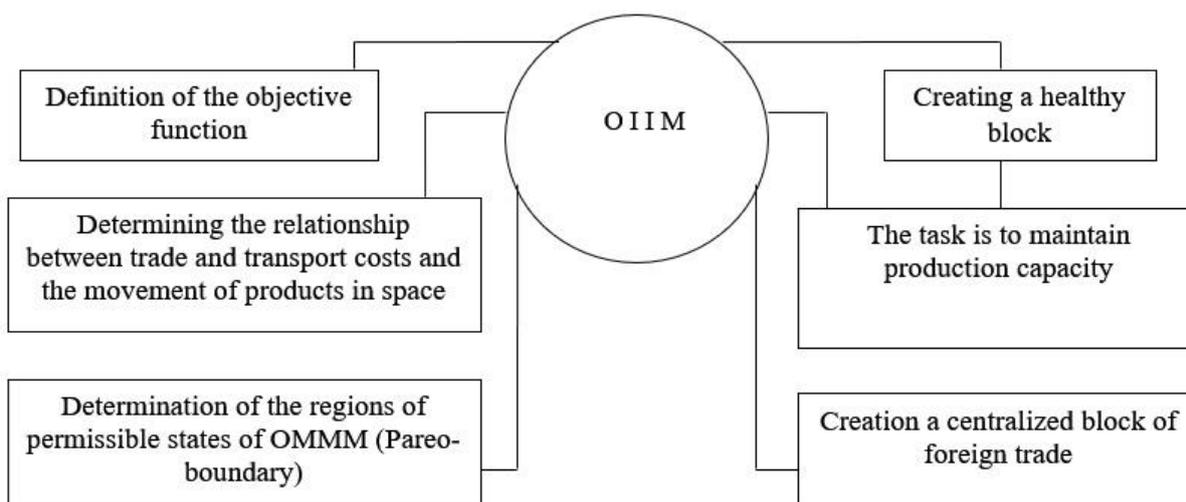

Figure 4: Problems of modern optimization inter-sectoral interregional model (Granberg, A. G., 2000).

Solving these problems allows you to create a flexible optimization model, the transition within which from one development scenario to another is carried out by changing a small number (15–20) of parameters, rather than a complete restructuring of many hundreds of boundaries into separate variables. The main restrictions are balances by industry, region, directions of transportation, the meaning of which is that it is impossible to consume and take out more than produced and imported. Therefore, the solution of this model shows one of the possible states of the economy that meets the interests of the country and the population of each region. The current research in the field of regional economics makes it particularly important to build effective programs and forecasts for the development of the Russian economy. An effective tool for solving problems of analysis and forecasting at the macro level in the context of the regions today are optimization interregional intersectoral models.

4. CONCLUSION

In conclusion of the above, the following conclusions can be drawn: the identification of the poles of competitiveness on the basis of interregional cooperation is one of the aspects of

considering the competitiveness of a region. The Belgorod Region cooperates both with the regions bordering it (Kursk, Voronezh Oblasts, Ukraine), and with regions with a remote geographical position (for example, Ryazan Region). The main products exported from the region are: iron ore and its processed products, agricultural products, as well as food. In addition, the region supplies construction materials, machinery and equipment, as well as innovative technologies and developments to the territory of Russia. Thus, it can be said that, based on the analysis of inter-regional interaction, the primary poles of competitiveness are the mining industry and agriculture. Based on the internal analysis of production activities within the region, the conclusions about the poles of competition (growth) were confirmed by the identified dynamic development of industries. The policy of import substitution within the country, the unstable economic situation in the country and the world, are the motivating factors for identifying the poles of the competitiveness of regions with a view to their further development. Emphasizing the strategic focus on these industries contributes to the level of competitiveness of the region, as well as food and material support of the country as a whole.

hafis_haciyev@yahoo.com*

ABSTRACT

It is well known that an economic security comprises a foundation of a national security. In this regard, the article reviews the main constituent elements of economic security at macro and micro levels, identifies approaches for developing a system of economic security of an enterprise and conducts their comparative analysis. Besides, the article determines measures for ensuring economic security of an enterprise through developing an accounting system.

Keywords: *accounting, economic security, risk*

1. INTRODUCTION

Strengthening competitiveness of internal production through attracting direct investments in the non-oil sectors of economy for further acceleration of developing this sector, support to import replacement activities and further increase in internal production, as well as increasing export possibilities of non-oil sector have been identified as strategic goals of Strategic Road Map on National Economy and Key Sectors of the Economy of Azerbaijan, as approved by the Order of the President of the Republic of Azerbaijan number 1138 on 06 December, 2016. One of the main factors of economic development is a favorable economic situation in the country ensured by the relevant state bodies in raising economic security and security of the national economy as a whole, as well as individual components of the economy. In the meantime, both individual household subjects and regions of the country need to take efforts to ensure own economic security. Economic security is one of components of the general concept "security". Any damage can receive the monetary assessment eventually that is the economic component of damage that may be allocated. Therefore, it is possible to note that economic security is the most universal and often interacting with others making the concepts "security".

2. THE MAIN COMPONENTS OF THE ECONOMIC SECURITY

To determine the place of economic security of a business entity in the national security system, it is necessary to clarify the constituent elements of national security. As noted by L.I.Abalkin, economic security is at the heart of a national security, since the economy plays a basic role in the development of society. At the same time: "... economic security is a set of conditions and factors ensuring the independence of the national economy, its stability and resilience to constant renewal and self-improvement" (Abalkin, 1994, p. 13). As we know, any accounting is conditional on the background of economic subjects. The state economy is founded and operates on the categories that are embodied in the simplest accounting system "plus/minus". This algorithm is the basis not only in the accounting system of business entities at the micro level, it is also the actual basis of the state macroeconomic policy. Even in the sphere of fiscal regulation, economic feasibility is one of the principles of building a national taxation system. A separate role of the concept of economic security belongs to a financial security, which is reviewed from the point of view of protecting the financial interests of the subjects of household economy at all levels of financial relations, inside and outside of the national economic system, protection of it from the adverse effect of external macro-economic and political factors (Milyaev, 2010, pp. 96-101). Thus, the criteria for ensuring the level of financial security, and, consequently, economic security can be considered the following: stability, balanced development of financial, moneyandcredit, monetary, budget, tax, settlement, investment and

stock system of the state. At micro-level of relations among subjects of household economy, one shall take into account one of the most important concept – principles of content priority over formality, which reviews the business process from the point of real economic content, not juridical forms. Therefore improving the system economic security is conditional on the following reasons: 1) adoption of a new company strategy and emergence of new risks; 2) systemic changes occurring in the company; 3) implementation of large corporate projects within the framework of the developed new strategy; 4) information support of the company's business processes; 5) introduction of new corporate management systems of management and electronic financial settlement systems. Thus, one of the key elements in improving the economic security of a company is taking into account the probability of the risk of the business process. Risk is one of the quintessence of a business process. The security of any business process depends on the level of risk that must be predicted and built in advance. Specialists integrate the main risk levels into the following segments: price risks; organizational risks; natural risks; legal risks; regulatory risks.

3. COMPARATIVE ANALYSIS OF APPROACHES TO CREATING A SYSTEM OF ECONOMIC SECURITY OF THE COMPANY

Proper identification of an economic nature of functioning enterprise, justification of risk levels of business processes are guarantees for building up an effective financial accounting system and financial accountability, as well as adoption of the right management decisions. When making the right management decisions, it is necessary to conduct an economic assessment of the effect of creation of economic security system and consider spilled approaches in its implementation. In this case allocate the following approaches: 1) value-based; 2) cost-based; 3) combined. The expediency of applying one approach or another is conditional on the position occupied in the market by this corporation and its mission. Table 1 presents a comparative analysis of approaches to creating a system of economic security of the company. Thus, the system of measures of economic security of the enterprise should be built on the basis of the following principles: 1) complexity - coherence of means, forms and methods in the construction of an integrated system of economic security which affects all areas of functioning of a business entity; 2) scientific character - determination of the list, content, sequence, size of protective measures aimed at ensuring a given level of security; 3) economic feasibility - the principle of implementation of security measures in which their value does not exceed the cumulative loss of a business entity; 4) separation - creation of successive lines of protection (protection zones) while the more important of the zones must be inside another, less important zone; 5) adequacy - created level of security is equal to or exceeds the threshold values of the indicators that determine the level of the company's functioning as safe, but not striving to create a level of "absolute" protection; 6) preventiveness - the implementation of security measures that act to prevent possible threats (risk prediction); 7) feasibility - the implementation of security measures to a specific object in specific conditions; 8) adaptability - the ways and forms of command that allow adapting to a new, risk or threatening situation; 9) continuity and systemacy - constant and systematic analysis of the functioning of a business entity and monitoring its economic security.

Table following on the next page

Table 1: Comparative analysis of approaches to creating a system of economic security of the company

Approach	Value-based	Cost-based	Combined
Purpose of application	It is used when a company has good financial capabilities (has a sufficient amount of liquid finance) and comes to determining the value of an economic security system and justifying the economic feasibility of its implementation	It is used with strict budget constraints to create economic security	It is applied at the stage of business process formation (when expanding a business or when changing the scope of activity)
Procedure of application	Typical solutions (the cost of which is known) by analogy with similar objects and assessed the achieved level of security by key indicators. The calculation of the safety indicators of the entity functioning is carried out and a list of the events is determined to achieve the goal set	It is necessary to determine the threat to economic security	Minimization of the most likely threats
Positive aspects	The project is proactively oriented, aimed at preventing potential damage. The project is aimed at solving a complex problem. The ability to plan costs and sources of funding. Varying basic indicators. Sufficient protection system. Planning and attracting new financial resources. High-quality organizational and economic management	The lowest costs for security	Lower costs for ensuring economic security compared with the cost approach. A higher level of security compared to the cost method. Possibility of redistributing the budget when creating an economic security system
Negative aspects	Large expenditure of financial flows to ensure economic security. The complexity of calculating the values of the basic indicators of economic security. No correlation between some basic indicators. The difficulty of predicting the occurrence of negative consequences and the cost of their solution. The need for highly qualified personnel	Creating the minimum possible conditions for economic security. The project aims to address certain security issues, and not a set of problems. The difficulty of varying the basic indicators. Limited funding and its instability. Organizational and technical and economic support of project is strictly limited	Availability of a large number of weak points. The difficulty of forecasting in time. High probability of loss. Availability of a reserve to compensate for possible damage. The complexity of managing the security system

4. ENSURING THE ECONOMIC SECURITY OF A BUSINESS ENTITY THROUGH THE PRISM OF BUILDING AN ACCOUNTING SYSTEM

Complex security and security of an enterprise is ensured through system of measures, directed towards prevention, identification, detection, localization and liquidation of threats independent of their sources of origin (Zhurko, 2008, pp. 89-100). Figure1 presents a system of measures to ensure the economic security of a business entity through the prism of building an accounting system.

System of measures to ensure the economic security	
Forecasting and identification of threats	Detection and localization of threats
Assessment of a damage	Liquidation of threats
Effective system of accounting	

Figure 1: The system of measures to ensure the economic security of a business entity

Forecasting and identifying of threats is possible during monitoring of the financial and business activity of a company, and the assessment involves calculating potential losses in cases of occurrence of force majeure circumstances and failure to take the necessary protection measures, that is, it involves predicting possible threats and specific actions to eliminate them. Evaluation is possible only when analyzing the financial statements of an enterprise which must be made on the basis of reliable accounting data of the enterprise. The accounting system in the Republic of Azerbaijan is represented by three types of accounting: financial, tax and management accounting (figure 2).

ACCOUNTING SYSTEM OF AN ENTERPRISE		
Management accounting	Financial accounting	Tax accounting
Based on internal regulations of entrepreneurial activity subjects	Based on normative base of the Republic of Azerbaijan	
Presents information to internal users	Presents information to external users	
Developed by managers	Reports are clearly regulated	
Is a basis for development of enterprise's strategy	Is a basis for development of state's strategy	
ECONOMIC SECURITY		

Figure 2: The accounting system of an enterprise

Thus, ensuring the economic security of the subjects of household economy is based on the accounting objectives set forth in Law of the Republic of Azerbaijan "On accounting" on 29 June, 2004 and Conceptual framework to National Accounting Standards for Commercial Organizations, which states that the purpose of accounting and financial reporting is to provide users with complete, reliable and unbiased information on the financial condition, results of operations and cash flow of the enterprise for making decisions. In addition, such a postulate as completeness of coverage plays an important role, that is, financial statements should contain all the information about the actual and potential consequences of business operations and events that can affect decisions made on its basis. In addition to financial and tax accounting at the enterprise, the accounting system is represented also by management accounting which is based on the managers' professionalism and, as a result, building of management accounting in an enterprise is a big half of the success of a company's business process. Financial, tax, statistical and other forms of reporting using a money meter are based on accounting data and they are not understandable to foreign investors who would like to invest in economy, but they are not sure that the information presented in the reports which will be made in accordance with applicable national standards will be accurate and complete. Therefore, very often the financial statements of a business entity are a product of straightforward management targeting, rather than the result of the desire to provide users with reliable and complete information about the financial and economic activity of the enterprise, and this in turn leads not only to the destruction of the economic security of the business entity in particular, but also destruction of the economic security of the entire national economic system as a whole, since it is impossible to predict the behaviour of the macroeconomic indicators and develop a state development strategy for the near future. Based on the abovementioned, it is possible to cure the main components of the company's economic security and the threat to economic activity (table 2).

Table 2: The components of the economic security of the company and the threats to economic activity

Components of the economic security of the company	Threats to economic activity
Financial security	Inefficient planning and management of company assets. Inefficient construction of a company's accounting system. Inconsistency in market conditions financial and tax strategies. Nonoptimal organizational structure of the company, price and personnel policy. Not completely accounted financial risk. Poorly organized control over the company's cash flow. Overdue receivables. Force-majeure circumstances.
Technical and technological security	Introduction of new technologies and production techniques by competitors. Errors in determining the technical and technological policy of the company. Lack of operational analysis of new techniques and technology. Damage from the late introduction of innovation in the production process.
Legal security	Inefficient normative and legal regulation. Low qualification of personnel. Poor organization of legal support of the company.
Information security	Lack of complete and reliable information about the activity of companies in the relevant industry (products and innovations introduced to companies, as well as about the employee incentive system, etc.). Undermining the company's reputation by spreading negative information about the business entity. Industrial espionage. Hacker attack on the company's computers.
Organizational security	Unscrupulous game of competitors in order to damage property and the financial and economic condition of a business entity, as well as the company's raider seizure. Loss of competitive advantages in the market.

5. CONCLUSION

The economic security of a national economic system directly depends on all its components, both at the macro- and microlevels, and it also depends on the degree of protection of its elements and the optimal ratios of the actions of the state, society and the economy. The economic security of an enterprise depends on such components as the level of arrangement of the enterprise's management accounting; the level of openness of the enterprise to external users through the financial and tax reporting provided by them; state fiscal policy; human resources potential of the enterprise; the level of coverage by globalization process; business process risks.

ABSTRACT

This paper investigates the impact of government education expenditures on economic growth in Azerbaijan during 1995-2017 using the Vector Error Correction Model (VECM). Since the study uses time series variables the unit root properties of employed variables are tested for non-stationarity. Stationarity of the data is tested using conventional Augmented Dickey-Fuller test. Different cointegration methods, namely, Johansen, DOLS, FMOLS and CCR are used in order to get more robust results. The results from cointegration methods are consistent with each other and confirm existence of long-run relationship among the variables. This implies that there is a long run relationship between government expenditures on education and economic growth in Azerbaijan. In order to test the quality of the model residuals of the model are tested for the serial correlation, heteroskedasticity, and normality. The model is checked for model misspecification and stability. The results of all above mentioned tests are found to be adequate. Moreover, estimation results of VECM show that government expenditures on education has positive and statistically significant impact on economic growth in the long-run. The paper concludes that a concerted effort should be made by policy makers to boost educational investment in order to accelerate economic growth.

Keywords: *Azerbaijan, cointegration, economic growth, government education expenditures, VECM*

1. INTRODUCTION

Education is an important determinant of economic growth for any country and is considered as one of the necessary conditions to achieve better outcomes on social welfare. Investing in education means to invest in human resources that are one of the most important factors of production function that is directly linked with the countries' development level and the standard of living. It raises the labor productivity and efficiency and thus produces skilled labor force that is capable of leading the economy towards the path of sustainable economic development (Zaman, 2008). Government expenditures on education lead to human capital formation more than to physical capital and social capital, and that makes a significant contribution to economic growth (Dickens et al., 2006; Loening, 2004). Because expenditures on education contribute to human capital development, they can help achieve better education outcomes. An investment in human capital, especially in education allows each person to contribute to their society productively. It becomes an important determinant of an economy's capability to achieve a high level of growth with low unemployment, high wages and a strong social unity.

Therefore, the impact of education spending on economic growth is one of the crucial issues in the economic literature. There are several models such as Solow (1956), Lucas (1988) and Romer (1990) that highlighted the human capital, formed through spending on education, as a driving force of economic growth. The social benefits of education provide a powerful set of arguments in favor of public investment to achieve the social optimum (Harsha, 2004). Therefore, government spending on education as investment is an economic issue well debated nowadays. There are a lot of empirical research papers that estimate the relationship between public expenditure on education sector and economic growth. However, they come out with different conclusions on the relationship between public expenditure of education and economic growth. The common view is that education expenditure is the key to sustainable growth (Blankenau et al., 2007: 393). Economic theory provides important foundations for this idea. Considering the studies on the importance of human capital, Nelson and Phelps (1966) stated that a better educated workforce would adopt technological developments faster and better mimic technology. Aghion and Howitt (1998) state that human capital accumulation increases the innovative capacity of the economy, thus accelerating growth. Benhabib and Spiegel (1994) stated that education supports economic growth, helping the successful implementation of new technologies designed by others, dissemination and dissemination of the information necessary for understanding and processing new information. Mankiw, Romer and Weil (1992), Lucas (1998), emphasized that the increase in the human capital of the individual can contribute to the productivity of all the factors of production except its own efficiency and thus provide a growth-promoting process. Therefore, education makes the manpower needed by the economy more efficient. Also, it contributes to the development of creative thinking and advanced techniques with more qualified workforce, which is more suitable to the needs of the changing economy, and thus prepares important foundations for the continuation of economic growth as well as social cohesion (Wykstra, 1971). Given the above arguments, the main aim of this paper is to investigate the impact of government's education expenditures on economic growth in Azerbaijan using annual data covering the period from 1995 to 2017. The contribution of the study is as follows: (a) It studies the government education expenditure-economic growth relationship in the case of Azerbaijan, which is a rarely investigated example under education-income framework, and is a good representative for the similar economies, (b) this is the first study investigating this relationship in the case of Azerbaijan by employing time-series data, which enables to see the country-specific features of this relationship.

2. LITERATURE REVIEW

In this section, the similar studies devoted to the relationship between government education expenditures and economic growth are reviewed. There are a vast of studies in economics literature investigating the relationship between education expenditures and economic growth. Empirical studies conducted by Landau (1983), Barro (1991), Tamang (2011), Mayer (2001), Bloom et al. (2001), Wolff (2001), Bose et al. (2007), Blankenau et al. (2007), Erdoğan and Yıldırım (2009), Petrakis and Stamakis (2002), Riasat et al. (2011), Asteriou and Agiomirgianakis (2011), Li and Kong (2012), Idrees and Siddiqi (2013), Koc (2013), Selim et al. (2014), Mekdad et al. (2014), Owusu-Nantwi (2015), Otieno (2016), Mallick et al. (2016) and Sunde (2017) concluded a positive relationship between education expenditures and economic growth. Furthermore, studies by Devarajan et al. (1996), Ndiyo (2007), Nurudeen and Usman (2010), Mariana (2015) and Eggoh et al. (2015) found a negative relationship between education expenditures and economic growth. In some studies, like Nketiah-Amponsah (2009), Griliches (1997), Çetin and Ecevit (2010), Pamuk ve Bektaş (2014), relationship between these two variables was not determined. Li and Kong (2012) empirically investigated long-term relationship between education spending and economic growth for China.

Their findings are very similar to Mallick and Dash (2015), where both studies found that there is one-way causality relationship between government education expenditures and economic growth. In another research for Bangladesh, Mukit (2012) revealed that government education expenditures has significantly positive long-term effects on economic growth for the period of 1995-2009. Moreover, Idrees and Siddiqi (2013) for G-7 countries, Mallick et al. (2016) for 14 Asian countries also found similar results. In addition, in a recent study over the period of 1976-2016, Sunde (2017) found a long term relationship between education expenditure and economic growth as in Mukit's (2012) research. Otieno (2016) investigated the impact of education expenditure per worker on economic growth for Kenya over the period of 1967-2010. The results revealed that education expenditure per worker has a positively and significantly impact on economic growth in both long term and short term. As can be seen from the literature review, no study has investigated the impact of government's education expenditures on economic growth in the case of Azerbaijan. Therefore the objective of the current study is to fill in this gap by utilizing VECM approach and different cointegration tests to observe long-run cointegration. The findings will suggest policy makers to take into account the role of government's education expenditures in economic growth for macro prudential regulation and sustainable development purposes in Azerbaijan and also contribute to the empirical literature for further studies in the case of similar countries.

3. MODEL AND DATA

3.1. Data

Our study uses annual data over the period 1995-2017 for empirical analysis. All data set have been taken from World Development Indicators of World Bank (WB, 2018) and The State Statistical Committee of the Republic of Azerbaijan (The State Statistical Comitee of Azerbaijan, 2018). Government expenditures on education (EDU_EX) is measured in million constant US dollars. Economic growth (Y) is measured by real GDP (2010 US \$). All the variables have been transformed into natural logarithmic form for consistent and reliable empirical results.

3.2. Methodology

We analyze relationship between energy consumption, economic growth and financial development using the different cointegration techniques and VECM method framework in this study. Our empirical analysis will cover the following stages. First, we will check non-stationarity characteristics of variables. We will use the Augmented Dickey Fuller unit root test (Dickey and Fuller, 1981, ADF) for this exercise. Since this test is widely used one, we do not describe it here. Interested readers can refer to Dickey and Fuller (1981). Second, if the orders of integration of the variables are the same, then we will apply cointegration tes(s) to see whether they are cointegrated. In order to be on the safe side, we will follow the latter option and hence, use the Johansen test (Johansen, 1995) as it is the only test can produce proper. Third, if we find only one cointegrated relationship among the variables, then alongside the Johansen method we will also use other alternative cointegration and long-run estimation methods to increase robustness of our inferences on the long-run relationship. For this exercise, we employ Dynamic Ordinary Least Squares (DOLS), Canonical Cointegrating Regression (CCR), Fully Modified Ordinary Least Squares (FMOLS) which is based on the residual-based cointegration method developed by Engle and Granger (1987). Lastly, After confirming the presence of cointegration between the variables, we will apply the Vector Error Correction Model (VECM) to investigate the long-run relationship among the variables. If between variables does exist one cointegration, the first-best solution would be using VECM model. The above mentioned methods are widely used techniques in similar studies, we do not describe them.

3.3. Empirical results and Discussion

First, we should check the stationarity properties of the used variables. As mentioned in the methodology section, for this purpose, we use the ADF unit root test. Results of unit root testing are presented in Table 1. We found that the variables are non-stationary at their levels but they are stationary at first difference, being integrated of order one, $I(1)$. We thus conclude that our variables are non-stationary in levels but stationary in their first differences. In other words, they follow integrated of order one, $I(1)$, processes. Our conclusion that the variables are $I(1)$ allows us to proceed to the cointegration test.

Table 1: Results of ADF unit root tests

Variable	Panel A: Level		Panel B: 1st difference		Result
	<i>k</i>	Actual value	<i>k</i>	Actual value	
<i>Y</i>	0	-0.861223	0	-3.445613**	$I(1)$
<i>EDUEX</i>	0	0.905844	1	-2.811665*	$I(1)$

Notes: Maximum lag order is set to two and optimal lag order (*k*) is selected based on Schwarz criterion in the ADF test; *, ** and *** accordingly indicates rejection of null hypothesis at 10%, 5% and 1% significance levels; critical values are taken from the table prepared by MacKinnon (1996). Time period: 1990-2015.

To apply the Johansen procedure, the optimal lag number should first be chosen. A Vector Auto Regressive (VAR) model was initially specified with the endogenous variables of *Y* and *EDUEX* and a pulse dummy¹. The details of this test were explained in table 2. A maximum of two lags was initially considered and both lag selection criteria and lag exclusion tests statistics suggested that indeed a lag of order two was optimal, which is intuitively appropriate given the small number of observations in the sample.

Table 2: Lag Interval Tests

Lag	LogL	Information Criteria				
		LR	FPE	AIC	SC	HQ
0	-9.629284	NA	0.010969	1.162928	1.262502	1.182366
1	38.40702	81.66171*	0.000135	-3.240702	-2.941982	-3.182388
2	44.52990	9.184322	0.000111*	-3.452990*	-2.955124*	-3.355801*
3	46.70444	2.826911	0.000139	-3.270444	-2.573432	-3.134380

* indicates lag order selected by the criterion

LR: sequential modified LR test statistic (each test at 5% level)

FPE: Final prediction error

AIC: Akaike information criterion

SC: Schwarz information criterion

HQ: Hannan-Quinn information criterion

Panels A through D in Table 3 report that the VAR has good properties as it is stable, its residuals have no issues with serial correlation and heteroscedasticity problem and residuals are normally distributed. The Johansen cointegration test results from the transposed version of the VAR, which is the VECM with one lag, are presented in Panels E and F of Table 3.

¹ We used a pulse dummy taking on unity in 2008 and zero otherwise, to capture the jump of *Y* in 2007 and the effect of the recent financial crisis.

Table 3: VAR residual diagnostics, stability and cointegration tests results

Panel A: Serial Correlation LM Test ^a				Panel E: Johansen Cointegration Rank Test (Trace)				
Lags	LM-Statistic	P-value		Null hypothesis	Eigenvalue	Trace statistics	0.05 Critical value	P-value
1	3.014	0.555		None *	0.575805	18.87043	15.49471	0.0149
2	2.765	0.597		At most 1	0.040200	0.861638	3.841466	0.3533
3	4.634	0.326						
4	1.786	0.774						
Panel B: Normality Test ^b				Panel F: Johansen Cointegration Rank Test (Maximum Eigenvalue)				
Statistic	χ^2	d.f.	P-value	Null hypothesis:	Eigenvalue	Max-Eigen Statistic	0.05 Critical value	P-value
Jarque-Bera	2.544	4	0.636	None *	0.575805	18.00879	14.26460	0.0122
				At most 1	0.040200	0.861638	3.841466	0.3533
Panel C: Heteroscedasticity Test ^c								
White Statistic	χ^2	d.f.	P-value					
	32.24	24	0.120					
Panel D: Stability Test ^d								
Modulus		Root						
0.959923		0.959923						
0.636985		0.041 - 0.635i						
0.636985		0.041 + 0.635i						
0.545367		0.545367						

Notes: a The null hypothesis in the Serial Correlation LM Test is that there is no serial correlation at lag of order h of the residuals; b The Normality Test is the Urzua (1997) system normality test with the null hypothesis of the residuals are multivariate normal; c The White Heteroscedasticity Test takes the null hypothesis of no cross terms heteroscedasticity in the residuals; d VAR stability test results show that no roots of characteristic polynomial are outside the unit circle; χ^2 is the Chi-square distribution; d.f. stands for degree of freedom.

Both the trace and the max-eigenvalue test statistics indicate one cointegration relationship among the variables. Therefore, we conclude that there is a cointegrating relationship among the variables. From the Johansen cointegration test results, we couldn't reject the hypothesis of one cointegration relationship. We also employed the Engle-Granger type DOLS, FMOLS and CCR methods to test whether the variables are cointegrated. The test results revealed that the variables are cointegrated (to save space we do not report the test results but they are available upon the request). Finally, we estimate FMOLS, DOLS and CCR methods as a further robustness check alongside the VECM in estimating the long-run coefficients. We bring together the estimated long-run coefficients from all the four different methods for the comparison purpose in Table 4.

Table following on the next page

Table 4: Estimation and testing results from the different cointegration methods

Method	VECM	DOLS	CCR	FMOLS
Panel A: Long-run equations				
Regressor	Coef. (Std. Er.)	Coef. (Std. Er.)	Coef. (Std. Er.)	Coef. (Std. Er.)
EDUEX	1.142 (0.013) ***	1.151 (0.117) ***	1.128 (0.020) ***	1.132 (0.021) ***
Panel B: Residuals diagnostics tests results for VECM				
$Q_{AR(2)}$	2.544 [0.863]			
LM_{SC}	3.241 [0.518]			
χ^2_{HETR}	16.06 [0.587]			
JB_N	4.993 [0.288]			

*Notes: Dependent variable is GDP; Coef. and Std. Er. denote coefficient and standard error; *, ** and *** indicate significance levels at 10%, 5% and 1%; Probabilities are in brackets; $Q_{AR(2)}$ = Q-statistic from testing AR(2) process; LM_{SC} = Lagrange multiplier statistic of serial correlation test; χ^2_{HETR} = Chi-squared statistic for heteroscedasticity test; JB_N = Jarque-Bera statistic for testing normality; In VECM, Jarque-Bera statistic was taken from the option of Orthogonalization: Residual Correlation (Doornik-Hansen).*

As it can be seen from the Table 4 the long-run coefficients from the different methods are statistically significant. Additionally, the residuals of the estimated specifications successfully pass the residuals diagnostics tests which is another indication of the robustness of the estimation results. We give priority to the VECM and discuss it little bit in detail as it outperforms all its counterparts when there is one cointegration relationship between variables, which is the case in our research here. Table 4 reports the impact of government education expenditures on economic growth in long run. We find that EDUEX has a positive and statistically significant impact at 1% level on economic growth. The results reveal that a 1% increase in government education expenditures, increases economic growth by 1.14%. Our results are consistent with the findings of Mukit's (2012) for 14 Asian countries, Idrees and Siddiqi (2013) for G-7 countries, Owusu-Nantwi (2015) for Ghana, Otieno (2016) for Kenya for Kenya and Sunde (2017) for Mauritius.

4. CONCLUSION

The study examines the relationship between government expenditures on education and economic growth. For this purpose, different cointegration techniques (Johansen, DOLS, FMOLS and CCR) and the VECM method were used to estimate the long run relationship among the variables. Our empirical evidences confirm that cointegration exists among the variables. This implies that there is a long run relationship between economic growth and government expenditures on education in Azerbaijan. Results of the estimations revealed that government education expenditures has statistically significant, positive impact on economic growth. This implies that 1% increase in EDU will increase economic growth 1.14%. The main finding and related policy implication of this study are a concerted effort should be made by policy makers to boost educational investment in order to accelerate economic growth.

ABSTRACT

As a result of the transition of the economy of the Republic of Azerbaijan to the post-oil stage in modern condition, its future development is largely connected with the socio-economic development of the regions. In its' turn, the great potential of the non-oil sector development and socio-economic development of our country are focused on the regions of the country. At present, the regions of Azerbaijan are on the threshold of being a leading power in the development of the national economy of our country. The development and diversification of the non-oil sector in the regions of Azerbaijan will generally create the basis for the country's economy in order to reduce dependence on oil revenues, increase the level of employment in the country and its transition to the sustainable development conception. The SWOT analysis of the sustainable, competitive and diversified conditions of the regions based on concrete materials have been revealed, evaluated and assessed on the basis of priorities of the non-oil sector in the regions. Over the past 15 years, the development and diversification of the non-oil sector in the regions has been implemented on three regional development programs adopted in the country. For this purpose, large financial support was provided for the development of the non-oil sector in the regions from the state budget, as well as from other financial sources, extensive tax, customs, loan concessions and subsidies. Sustainable development in the regions caused to the consistent growth of economic and social indicators, balanced development of the balancing growth rate, on the one hand, and improving level of development on the other hand. Taking into consideration, the adoption of "Strategic Road Map on Major Sectors of the National Economy and economy" will provide the competitiveness, inclusiveness and further improvement of social well-being of the economy on the basis of national economic development and sustainable economic development of the regions. The directions of improving the conceptual framework for the development of targeted state programs in different spheres and directions are being developed on the basis of structural analysis of non-oil fields in the regions of Azerbaijan. As a result of the carried out research, specific proposals and recommendations have been put forward for the development of the non-oil sector, diversification and stimulation of increasing export potential in the regions of Azerbaijan.

Keywords: *strutural analysis, regions, non-oil sector, sustainable development, diversification, national economy, transition, regulation, export*

1. INTRODUCTION

An effective and sustainable development of the economic structure, including the economic structure of the regions, is essential for the balanced development of the national economy. It should be taken into account that the great progress made by Western European countries in economic growth is linked to the successful changes in the structure of the country and the regional economy, because these changes have given the overall dynamism to the production process in the country and has led to some other positive changes. Generally, social division of labor is a continuous process, where the main branch structure of the economy is formed. It is complex and dynamic, subject to quantitative and qualitative changes by the affect of scientific-technical progress, cyclical development of the economy and other factors.

On such a basis it is worth mentioning that the regional structure of the economy is considered in two aspects:

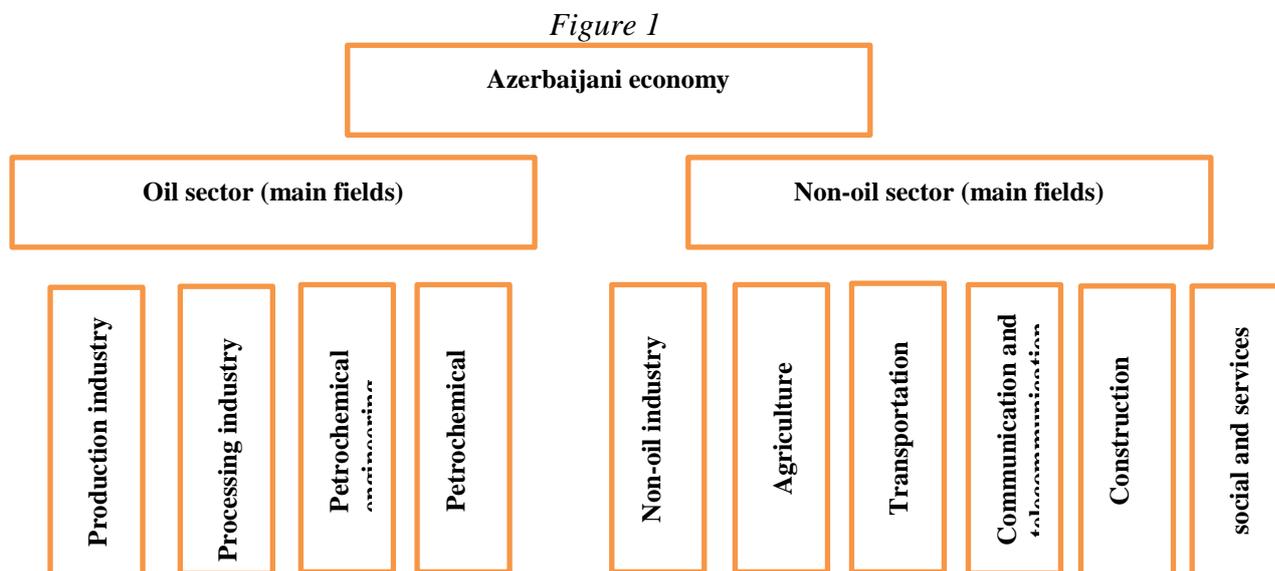

- Placment of economic fields in the territory of the country;
- region system with its internal structures in the territory of the republic.

It should be specially mentioned another issue that the formation of an efficient regional economic system depends primarily on the efficient use of all available natural and socioeconomic resources in the region. All this happens on the same ground that national economies are constantly changing and exposed to transformation processes. The strongest effect on the processes is the scientific-technical progress. Scientific and technical progress changes the character of production, creates new economic fields and spheres, and affects the character of mutual relations in the national economy. For this reason, the structure of the national economy is constantly changing, which, in turn, implies continuing structural monitoring and the need to compare the real economic structure with its future development perspectives. The structure of the specific national economy is shaped by the influence of many factors: geographical, cultural, social, economic. It should be noted that one of the most important tasks for the regions is to achieve mutual development of economic fields, production and social infrastructure, complex solution of social and economic development issues. Territory of each region is the most important ground and a condition for productive forces deployment, as well as for the creation and functioning of production areas using mineral and raw materials, labor and natural resources.

2. THE REASONS FOR THE PROBLEM OF NON-OIL SECTOR DEVELOPMENT IN THE REPUBLIC OF AZERBAIJAN

The Azerbaijani economy has been under the strong influence of the oil factor for almost two centuries. It is known that most of the national production of the country, including the products exported from the country, is made up of oil and oil products. This situation necessitates the increase in the overall weight of export products produced in the country at the same time the share of other industries in the total weight of export products. Therefore, the modern economic policy of the Republic of Azerbaijan is primarily aimed at diversifying the economy, reducing dependence on the oil sector, and achieving dynamic development of the non-oil sector. According to the State Statistics Committee of Azerbaijan, 92.7% of the exported products are exportation of oil and oil products. At the same time, 75% of all industrial products produced in the country is on the account of state budget and 50% is on the account of oil sector. [5]. According to UNCTAD estimates, Azerbaijan's economy is among the countries with dependence on energy resources [9]. 93% of state budget funds come from the capital city and 7% come from regions [5]. That's why when analyzing the structure of the economy of Azerbaijan in the main economic spheres, assessments are generally carried out on the basis of the division of the economy into two important sectors. I oil sector and II non-oil sector. The reason for such a situation was inherited from the Russian Empire and Soviet era. Azerbaijani economy has developed disproportionally on fields and regions [4]. The solution of elimination of issues of these problems, in parallel, brought about the simultaneous solution of these two problems. These are the issues of eliminating the inter-regional and inter-sectoral disproportionality in the national economy. The radical changes taking place in the socio-political and socio-economic life of the Republic of Azerbaijan during the years of independence also covered the economy of the regions of the republic. It was accompanied by quality changes in the economy of the country, including the regions during transition to the market economy. However, not all of these issues were resolved immediately. The most serious problem was that most of the country's industrial potential was mainly concentrated in Baku, and then partly in Sumgayit, Ganja and Mingachevir.

Such a situation creates a serious impediment to the development of the national economy as a whole and to regional aspects. As a result of Armenian aggression, the problems were aggravated by the destruction of the cities and villages of the republic, the occupation of those territories, the deportation of the Azerbaijanis and the damage to the national economy.

Source: Made by author.

Under such conditions, there is a need to identify the current economic development opportunities of the Azerbaijani economy, weak and strong sides, challenges and threats to develop the country's economy, including the non-oil sector of the regional economy.

Table 1: SWOT analysis of modern state of Azerbaijani economy.

Strong sides	<p><u>Macroeconomic</u></p> <ul style="list-style-type: none"> • Availability of mineral resources • Specialized workforce; • High level education • Political stability • GDP growth rate at high pace <p><u>Sectoral and Regional</u></p> <ul style="list-style-type: none"> - Having a favorable natural climate and fertile geographical position in agriculture and livestock areas. - Having a natural, historical and cultural wealth that benefits the development of tourism. - Fertile condition for the production of agrarian and livestock products as a raw material for the food industry.
Weak sides	<ul style="list-style-type: none"> • weak development of the processing industry in the non-oil sector; • Low level of rural income; • Market limitations; • absence of direct access to EU, US, Japanese markets;
Opportunities	<ul style="list-style-type: none"> • The possibility of using oil revenues in other areas; • Production of competitive products with the application of modern technologies; • The development of the economy by attracting investments
Dangers	<ul style="list-style-type: none"> • Oil price decline; • Economic crisis • Financial crisis • Decrease in competitiveness of Azerbaijani products • decrease in the level of life of the country's population

Source: Made by author

As seen, in the context of the current state of the economy of the republic it is required to diversified development of the economy of Azerbaijan in certain directions:

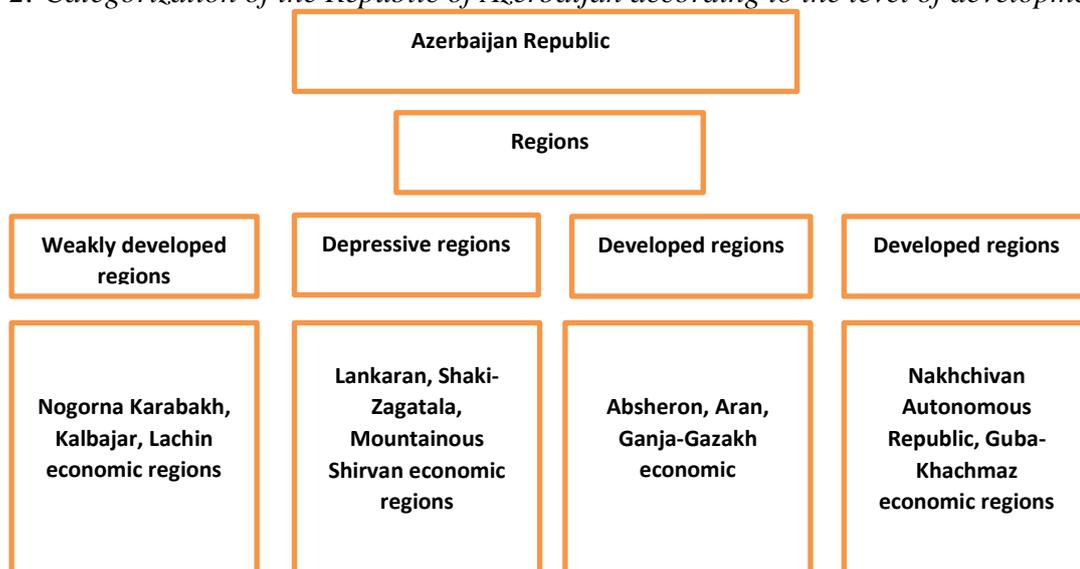

- Diversification of GDP should be based on non-oil sector;
- Diversification of export should be based on the export of innovative products;
- Diversification of institutional security should be based on natural, physical, human and institutional capital;
- The process of diversifying the regional economy should be further deepened, and the potential for disproportionation between oil and non-oil sectors should be sought in the regional economy.

Accordingly, it should be noted that the main trends of the "Azerbaijan 2020: Look Into the Future, Concept of Development" include the non-oil sector, in particular, has been specifically identified as one of the strategic aspects of the non-oil sector development of the regional economy.

3. THE REASON FOR THE NECESSITY OF THE DEVELOPMENT OF THE NON-OIL SECTOR IN THE REGIONAL ECONOMY

The territory of the Republic of Azerbaijan is currently divided into the following economic regions. Absheron economic region; Aran economic region; Highland Shirvan economic region; Guba-Khachmaz economic region; Lankaran economic region; Nakhchivan Autonomous Republic; Shaki-Zagatala economic region; Upper Karabakh economic region; Kalbajar-Lachin economic region.

Figure 2: Categorization of the Republic of Azerbaijan according to the level of development

Source: made by author.

Based on the assessment of the current state of the regions of the Republic of Azerbaijan, they can be divided into the following categories:

- Developed regions - Absheron, Aran, Ganja-Gazakh economic regions;
- Developing regions - Nakhchivan Autonomous Republic, Guba-Khachmaz;
- Poorly developed regions - Lankaran, Shaki-Zagatala, Mountainous Shirvan;
- Depressive regions - Nagorno-Karabakh, Kalbajar-Lachin economic regions.

It should be noted once again that special attention was paid to the non-oil sector development in the Republic of Azerbaijan since the early 2000s. The goal here is to further develop the national economy in the context of eliminating economic issues and interregional disproportions in the republic. In order to achieve these goals, many programs have been developed and implemented, containing the strategic priorities of the state policy in the Republic of Azerbaijan. Accordingly, it would be expedient to make assessments on the non-oil sector development issues in the regions of the Republic of Azerbaijan within the State Program.

4. SOLUTION DIRECTIONS OF NON-OIL SECTOR DEVELOPMENT ISSUES IN THE REGIONS OF THE REPUBLIC OF AZERBAIJAN WITHIN STATE PROGRAMS

Many State-funded State Programs have been developed and implemented to ensure macroeconomic balance and sustainable development in the early years of independence. The following State Programs may be specially mentioned for the sample: [6]:

- State Program for the Support of Small and Medium Entrepreneurship in the Republic of Azerbaijan" (1997-2000)";
- State Program for Development of Small and Medium Entrepreneurship in the Republic of Azerbaijan (2002-2005)";
- "State Program for the Development of Machine Building industry in the Republic of Azerbaijan (2002-2005)";
- "State Program of Agrarian Sector in the Republic of Azerbaijan (2002-2006)";
- "Demographic development conception of Azerbaijan Republic";
- " State Program on Tourism Development in the Republic of Azerbaijan in 2002-2005";
- " State Program on Poverty Reduction and Economic Development in the Republic of Azerbaijan (2003-2005)";
- " State programs of socio-economic development of the regions of the Republic of Azerbaijan (2004-2018)" (I State Program 2004-2008; II State Program 2009-2013; III State Program 2014-2018).
- On March 16, 2016, according to the decree of the President of the Republic of Azerbaijan, 12 strategic roadmaps on the national economy and 11 sectors of the economy can be elaborated on the approval of the "Main Directions of the Strategic Road Map on Major Sectors of the National Economy and Economy" [1].

The above-mentioned State Programs generally reflect the regional development aspects of the non-oil sector of the national economy. The main objective of the regional development strategy, developed and successfully implemented in the Republic of Azerbaijan, is to restore the balance between regional and economic development levels effectively using oil and gas revenues and to achieve a number of socio-economic problems. The problem of development of the non-oil sector, which has more prospects for development in the regions of the republic, has been raised. From this point of view, it should be noted that the main objective of the State Program on Socio-Economic Development of the Republic of Azerbaijan (2004-2008), approved by the Decree of the President of the Republic of Azerbaijan dated on February 11, 2004, is the sustainable development of the non-oil sector, provision of balanced development of the regions of the country, improvement of communal services and social infrastructure in the regions, employment, living standards, etc. Within the framework of implementation of the program, the following results are considered in 2004-2008. In the first regional development program, the provisions of the Optimization of the Specialization in the Republic of Azerbaijan and the deployment of productive forces were reflected. 714 state measures were implemented on this basis 668 events were dedicated to socio-economic development of nine regions of the

Republic of Azerbaijan. Funds were allocated for the implementation of important infrastructure projects. As a result of the implementation of a number of relevant measures, the package of projects for the balancing of the development of the country's territory and the development of the non-oil sector in the regions was formed. At this stage 26641 new enterprises were opened, 547600 jobs were created - permanent jobs were created [2]. Then, the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2009-2013 was approved by the Decree of the President of the Republic of Azerbaijan No 80 of April 14, 2009 for the continuation of the measures taken since 2004. As a result of the successful implementation of the "State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan in 2009-2013", a high level of macroeconomic indicators has been achieved in the country and successful results have been achieved in improving the living standards of the population in socio-economic development. More than 240 decrees were signed on accelerating socioeconomic development of cities and districts included in all economic regions during implementation of both state economic programs in the Republic of Azerbaijan. Execution of these programs for the non-oil sector was 2.6 times higher in this sector [10]. The Second State Program (2009-2013) envisaged the development of the agrarian sector of the country, production, social and market infrastructure in regions, and the elimination of unemployment in specific territorial structures of the national economy. At this stage 1066 large-scale projects were implemented, of which 968 were covered by economic regions. The remaining 40 projects covered Baku and the surrounding districts [8]. The State Program's Action Plan envisages implementation of 1066 measures throughout the country, including 58 of the country's significance, 40 in Baku and 968 in economic regions, which have been fully realized in the current period. As a result of carried out measures, the regions of the Republic of Azerbaijan were provided with continuous energy and drinking water. At the same time, construction and rehabilitation of roads and other infrastructure facilities were carried out. Environmental conditions in the regions have been significantly improved, and many social objects have been put into use in education, health and tourism. Only 5,400 enterprises, 117,000 new jobs and 93,000 new jobs were created within the program in 2012. Totally 20,000 new enterprises were created in Azerbaijan in 2009 and 360,000 jobs were created in the regions. Unemployment reduced by 5.2%, poverty by 6%. For the next four years, the State Program on Socio-Economic Development of the Regions of the Republic of Azerbaijan for 2014-2018 was approved by President of the Republic of Azerbaijan Ilham Aliyev's Decree of February 27, 2014. The initial version of the State Program was prepared by the Ministry of Economic Development in line with the offers submitted by the relevant agencies to the Ministry of Economic Development on the basis of an official appeal submitted to local and central executive authorities in September 2012; The state program on socio-economic development of the next regions will be adopted in 2019 [11]. Accordingly, it would be expedient to review some of the processes in the non-oil sector in the regions of the Republic over the last 15 years.

5. REGIONAL ASPECTS OF CHANGES AND PROCESSES IN THE NON-OIL SECTOR OF THE AZERBAIJANI ECONOMY

The main priorities in the development of the non-oil sector in the country are the development of the agrarian sector in ICT, tourism, transport and energy (in particular, alternative energy production). 44% of the population of the Republic operates in these areas. Over the last 15 years, 60% of 100 billion investment in the country has been invested in the non-oil sector [7].

Table following on the next page

Table 2: Investments in main capital on oil and non-oil sectors

Years	Total	Including			
		Oil sector		Non-oil sector	
		Total	Special weight %	Total	Special weight %
2003	3786366.7	2771092.1	73.2	1.015274.6	26.8
2004	4922755.9	3.7081384	75.3	1.214617.5	24.7

Source: <https://www.stat.gov.az>.

As seen from the table, In the last 15 years, more exactly, since 2003, investments in the main capital of both sectors of the Azerbaijani economy have grown almost every year. Starting from 2007, non-oil capital investment in capital investments has become more than the oil sector. Such a trend is still going on. This means that productivity in the non-oil sector can be solved by solving the problems of economic development. At the same time, it should be noted that, as a result of the state programs implemented in the last 15 years, the country's gross domestic product increased by 0.1 percent to 70135.1 million manat in 2017. The most important point is that 62.8% of the GDP was produced in the non-oil sectors of the economy and 37.2% in the oil and gas sector. During this period, the value added in the oil sector of the economy decreased by 5.0 percent, in the non-oil sector - by 2.7 percent, including transport and warehousing - by 8.5 percent, information and communications - by 6.6 percent, 5.9% in catering, 4.2% in agriculture, forestry and fishing, trade; 2.5 per cent in the field of repair of vehicles, 1.5 per cent in social and other services. At the same time, production of non-oil products increased by 3.7 percent compared to the same period of the previous year, and added value added in this area rose by 3.8 percent. 40.1 percent industrial production of GDP, 10.4 percent in trade and transport, 9.5 percent in construction, 6.8 percent in transport and storage, 5.6 percent in agriculture, forestry and fishing, 2.3 percent the share of tourists and public catering, 1.6 per cent for information and communication, and 16.4 per cent for other sectors, while net taxes on product and import accounted for 7.3 per cent of GDP [12]. Naturally, special attention was paid to the regional aspects of non-oil sector development in the republic. On such a basis, it should be taken into account that in the contemporary period, the regional structure of the economy of the Republic of Azerbaijan is assessed in the context of the analysis of key indicators of economic regions by sectors. The regional structure of the republic's economy has grown to some extent about a century of historical development. During these years, the main driving force of the process was the solution of the problem of economic zoning of the country. From the 20s to the 90s of the XX century, the concept of regional governance was first developed based on Soviet management requirements, then new established, young and independent economic management requirements and criteria of the Republic of Azerbaijan. The development of non-oil production sphere has become a priority for the creation of new jobs in this concept, in particular, in order to make the country more efficient use of regional

resources. The intensive stage of the implementation of this approach is intensified even during the implementation of regional development concepts. The opinion is confirmed by the quantitative indicator of newly opened enterprises in the Republic of Azerbaijan, including in the regions in 2003-2017 (see Table 3.)

Source: Regional development: results of successful policy//Ministry of Economy of the Republic of Azerbaijan//<https://www.economy.gov.az/>

37479 new enterprises were launched in the regions of the Republic of Azerbaijan in the process of implementation of the State Program on the development of the regions, the old enterprises are modernized with the new equipment.

6. RESULT

Non-oil sectors in the regions of the Republic of Azerbaijan: Production and processing of agricultural products (non-oil, food, light industry, food industry, agrarian industry), are carried out in the directions of especially non-oil; construction industry enterprises; construction of objects of socio-economic infrastructure (roads, housing, education, cultural-educational, healthcare etc.); in some areas. All these measures, in parallel, once again confirm the development of human capital in the republic and the social orientation of state policy.

INNOVATIVE PROCESSES AS A FACTOR OF ECONOMIC DEVELOPMENT

Sarvinaz M. Khanlarzadeh

Azerbaijan State University of Economics (UNEC)

Baku, Istiqlaliyyat str.6, AZ1001 Azerbaijan

sxanlarzade@rambler.ru

ABSTRACT

The article substantiates that there is a deep relationship between economic development and the innovation sphere. An important distinctive feature of modern economic development is the increasing influence of science on production, along with the growth of the reverse influence of the economic environment on scientific and technical activity. It has to be noted that the deep source of the fundamental socio-economic and technical transformation of society in the modern era is the intensive development of innovative processes.

Keywords: *economic development, innovation processes, scientific and technical progress, innovation activity*

1. INTRODUCTION

The development and dynamism of the innovation sphere - science, new technologies, knowledge-intensive industries - have become the main factor of economic development, the basis of the competitiveness of firms, sectors of the national economy. On the basis of the use of knowledge and innovation, the so-called "new economy" has received accelerated development. The use of technology and technology in production has become the leading force of social progress. In the upcoming future, the level of economic development of the national economy, its place in the civilized world will be determined not so much by an abundance of labor and mineral resources, but by the quality of human capital, level of education and practical use of knowledge, innovative potential of the economy. In the globalizing world, those countries that provide favorable conditions for accelerating the scientific, technical and information revolution, for unhindered use of its latest achievements, will win in the growing competitive struggle. The priority is the state policy of strengthening the scientific and technical potential of introducing innovative developments, comprehensive support for the enhancement of science, education and modern technologies. It is necessary to accelerate the transition to an innovative development model focused on the latest achievements of science and technology.

2. INNOVATION AS A PROCESS OF IMPLEMENTATION OF NOVELTY

Intensive improvement of the national economy has created wide opportunities for implementation of the latest achievements of the scientific, technical and information revolution in the country, accumulated in the world over the past decades of the experience of rational organization of innovation activity and encouragement of enterprises to apply innovations. Investing in innovation is not everything. The main thing is to introduce novelty, to turn it into a form of innovation, i.e. complete innovation activity and get a positive result, then continue the diffusion of innovation. Innovation can be characterized as a process of implementing a novation. At the same time, innovation doesn't mean just an object embedded into production, but an object successfully introduced and making a profit as a result of conducting scientific research or a discovery made qualitatively different from the previous analogue. Depending on the object and subject of research, innovation can be viewed as a process, system, change, and as a result. Innovation should be focused on a more complete satisfaction of consumer demand in a constantly changing market conditions. Each product produced should be considered as an object of constant change.

Competitors need to be studied not only as rivals, but also as possible sources of ideas. The transformation of scientific knowledge into innovation is an innovation process, that is, a consistent chain of events in which innovation matures from idea to a specific product, technology or service and is distributed through practical use (Ivaschenko N.P., 2016, p. 14). In contrast to scientific and technological progress, the innovation process does not end with the so-called introduction — the first appearance of a new product, service in the market, or bringing of a new technology to the design capacity. This process is not interrupted even after implementation, because as diffusion (distribution) of innovations improves, becomes more effective, acquires new consumer properties. This opens up new areas of application for it, new markets, and, consequently, new consumers who perceive this product, technology or service as new for themselves. Thus, the innovation process is aimed at creating the market-required products, technologies or services and is carried out in close unity with the environment: its focus, pace, goals depend on the socio-economic environment in which it operates and develops. Robert Solow, Professor of Massachusetts Institute of Technology, Nobel Prize winner in economics, clearly noted that the source of long-term economic growth is not real estate and equipment investments, but technological changes. His calculations based on the materials of American statistics have shown that the assessment of the role of technological changes in the growth rates of private sector production reaches 60-70% (Romanchuk J., 2008, pp. 69–70).

3. TECHNICAL MODERNIZATION IS THE BASIS OF ECONOMIC DEVELOPMENT

In the long run, technological innovation is necessary to increase the efficiency of the economy and raise the standard of living. Creating them requires an investment climate that must be supported by the public and private sectors. This, in particular, implies sufficient investment in scientific research, especially from businesses, the creation of high-quality research institutes by the state, private sector cooperation in investigations of research institutes, universities and industry, as well as guarantees protecting intellectual property and potential investments. It should be noted that technology does not predetermine the development of society. But society also does not prescribe the course of technological change. However, society can, strangle the development of technology by using the power of state. Or, on the contrary, it can also, through government intervention, begin an accelerated process of technological modernization, capable of changing the economy over several years, increasing military power and social well-being. Nowadays technical modernization of the economy occurs in all countries. But there are huge differences in the scale, pace of intensity and results of this process. In some countries, technical modernization of various sectors of the economy has been an element of state-driven policy for many years, in others it only begins in certain sectors of the economy. But in all countries, technical and technological modernization and increasing innovative activities are an objective need for economic development, due to the causes of the internal and external order. Creating a domestic market for high-tech innovative products will allow on a large scale to "grow" their national high-tech and competitive companies (Milner B.Z., 2010, pp. 5-6). In this regard, the soonest creation and development of a competitive innovative economy is one of the top priorities for Azerbaijan.

4. THE PERSPECTIVE OF THE AZERBAIJANI ECONOMY IS ASSOCIATED WITH THE DEVELOPMENT OF INNOVATION ACTIVITY

In developed countries the intensity of innovation determines the level of economic development. In global competitive environment, the winners are the states which provide favorable conditions for innovative activity. Taking into account the rapid globalization, most of the countries of the world have begun to form a new technological structure of the

improvement of their own economies. An important process of transition from the industrial era to the information market has begun in the republic. It can be stated with confidence that this last transition is actually decisive. Independent Azerbaijan began to implement profound socioeconomic and institutional-economic transformations and faced the choice of the most promising areas of state policy, defining new outlines of society. Thus, it is absolutely clear that the socio-economic perspectives of Azerbaijan, its place in the world economic space depend not only on the effectiveness of creating a favorable economic and investment climate in the country and on creating conditions for the development of competitive sectors of the national economy, but also on how successfully it moves to an innovative economy. In the 21st century, in the postindustrial world and in the context of deepening globalization of economic processes, the security of a country and its technological independence are determined by scientific and technical potential, high qualification of personnel and innovative opportunities. In numerous scientific studies on the problems of socio-economic development, there are two strategic directions:

1. The continuation of market reforms with a commodity-oriented economy, which will continue to characterize the country as an agrarian and raw material appendage of the industrial centers of the world;
2. The intensification of economic transformations based on the stabilization of the political and legislative legal system, the new socio-economic strategy aimed at diversification of economy, as well as the effective integration of the country into the world economy.

At the present stage, as the world experience shows, the effective is a new innovative way of economic development, suggesting the interconnected development of scientific, technical, industrial, financial, social, institutional and other spheres. It is absolutely clear that the implementation of such a large-scale strategy is possible only with the broad state protectionism of scientific and technological development, providing a socially-oriented technological breakthrough. In conditions when the scientific and technological revolution is expanding more and more widely, economic development involves the maximum use of its results, particularly, in the form of technology as an independent factor of production. The close relationship between economic growth and scientific and technological progress, the need of improvement of the competitiveness of the entire economy, necessitates the urgent activation of innovation activities in our country. The underlying causes and mechanisms of economic development are, firstly, competition based on innovation, and, secondly, the creation of human innovator-entrepreneur, capable of translating new ideas into effective economic solutions. At the same time, the perspectives for socio-economic progress of Azerbaijan in the context of intensive integration with the world market, as a result of the consistent implementation of the "open economy" policy, to a decisive extent depend on the state's targeted activities in creating a favorable innovation climate, creating and maintaining competitiveness of existing and newly created promising industries. For the revival of the national economy in the global world, it is necessary to clearly understand the decisive role of science and innovation in ensuring the competitive advantage of the country. As in the 21st century the country's security and its technological independence will be determined by the scientific and technical potential, primarily, by the level of basic science, personnel skills and innovation potential. In order for the Republic of Azerbaijan to occupy an equal place in the global economic environment, it is necessary to strictly take into account the peculiarities of the development of the modern era, consisting in the unprecedented improvement of science and technology. World experience shows that the national state can play an important role in enhancing the internal and international competitiveness of domestic industry through the formation of innovative activities. Impulses of innovation can be internal, for example, physical wear of equipment, the need to reduce energy costs, the traditional desire to expand production capacity.

In those enterprises where there has been a change in the owner and management of an enterprise, institutional changes have become the reasons for innovation, specifically, a change in the form of control over the enterprise. But any initiatives that are born in the enterprise are adjusted by market restrictions. Market needs are the main external impulse of innovation in enterprises, whether it is the response to the loss of traditional sales markets, the search for their place in a competitive market and the identification of new market opportunities. If innovations generated from within are mostly process-based, then the orientation of enterprises towards the market pushes them towards productive innovations. At the same time, innovations can be initiated by external causes of non-market properties - social needs in a broad sense, which degenerate in the social policy of the state or the speeches of social movements. The opening of the Azerbaijani market for exports stimulated the improvement of quality and expansion of the product range, forced to sell it at lower prices than imported counterparts. The competition from local small producers has increased. With the acceleration of the globalization process, modern technical means and technologies inevitably penetrate into the most remote corners of the globe. To tell the truth, this is not only modern technology, but also new forms of management. The observed economic growth in the republic is based on increasing the export of petroleum products, but nevertheless, the stabilization of the socio-economic and financial situation in the country and the transition to consistent economic growth created the conditions for the development of the scientific and technical sphere. In recent years, the coordinating role of scientific activity in the republic has increased. Statistics show that innovation, as one of the leading areas of industrial modernization in the country, has gradually begun to intensify. It should be noted that innovation activity in the republic is carried out mainly in medium and large industrial enterprises. At the same time, it is encouraging that the most of the innovative products are new or undergo significant changes. As for products undergoing improvement, their share is very small. The reason for this situation, in our opinion, is that enterprises producing intermediate products (component parts and parts for other industries) have found themselves in a strong dependence on the position of enterprises - consumers of their products, the volumes of their production and pricing policy. Therefore, innovations in such enterprises are associated with the development of the production of new products, which is the ultimate and can be implemented. The main factors hindering innovation in local enterprises are:

- Lack of own funds;
- Lack of financial support from the state;
- High cost of innovation;
- Low effective demand for new products, high risk;
- Long payback periods of innovations.

Innovation barriers are also related to the following production factors: low innovative potential of the enterprise, lack of qualified personnel, lack of information about new technologies, lack of enterprise ability to innovate, lack of opportunities for co-operation. In order to activate innovation activity, it is necessary to form an organizational-economic mechanism, which is a combination of organizational and economic methods, tools and levers, in order to develop the capabilities of the enterprise and allowing to manage the innovation sphere (Goncharenko MA, Dubravina L.I., 2015, p. 104). To increase the innovation activity of enterprises, it is necessary to use tax instruments. Enterprises that produce new competitive equipment and use advanced technologies should apply preferential taxation of property (for example, to fully exempt them from property tax in the first year of their activity, 50% in the second, 30% in the third, 20% - in the fourth). In addition to providing tax breaks, innovative enterprises and organizations should be stimulated through effective depreciation policies. The amortization fund for innovative reproduction serves as a financial source not only for recovery,

but also for the expansion of fixed assets. Thus, the transition of the economy to a new qualitative position determines the importance of activating innovation, solving the problems of forming the innovative potential of the country, allowing to reorganize the economy, accelerate the development of high-tech production, which should become the most important factor in ensuring conditions for economic growth. As a result of the acceleration of technological progress in the world, our country has opened up tremendous opportunities for its socio-economic development based on the acceleration of innovation activity.

5. DEVELOPMENT OF INNOVATION POLICY OF AZERBAIJAN FOR THE INTENSIFICATION OF INNOVATION ACTIVITY

The dynamic development of the innovation sphere is one of the main components of the innovation economy, the main feature of which is that the processes of creation, dissemination and introduction of new knowledge become crucial for the development of the country, ensuring a harmonious combination of economic growth with the preservation of the natural environment and social progress (Zadumkin, K.A, 2010, p. 6). Innovation economy implies the existence of an effective innovation system and the creation of institutions to support the innovation process. The state innovation system is understood as a set of interrelated organizations (structures) engaged in the production and commercialization of scientific knowledge and technology within national boundaries, small and large enterprises, universities, laboratories, techno parks and incubators as a complex of institutes legal, financial and social in nature, providing innovative processes (Shabelnikova E.A., 2017, p. 79). The challenges of the development of an innovation system create needs of the integrated use of direct and indirect methods of state regulation in the framework of innovation policy, which is an integral part of government policy, designed to ensure consistency in the field of international scientific and technical cooperation in science and technology in the new environment. Innovation policy is a part of the socio-economic policy, defining the goals and priorities of the innovation strategy, and the mechanism for its implementation by state authorities. Innovation policy of the government should consist of the search for optimal ways of improvement of society; identifying promising industries, their financial aid, the economic regulation of innovation processes; organizational, legal and other support for the earliest possible introduction into the sphere of production and services of the achievements of science and technology (M.A. Nikolaev, M.Y Mahotaeva, 2013, pp. 40-41). For the country as a whole, the innovation strategy is the significant goals of technological development, determining the direction of priority financing, creating an intellectual and information structure for designing, encouraging management to maximize the use of human resources, updating the legislative framework of the innovation sphere, primarily in the field of taxation, and restructuring of the scientific sphere with the release of the innovation sector, which is engaged in searching for the most effective completed research projects that can be implemented. The complexity of developing of an innovation strategy lies in the fact that the innovation sphere is inherently multidimensional (it includes elements of various levels) and it is a control system in relation to technology. Since representatives of not only various specialties, but also various government bodies are involved in innovation activity, the search for successful solutions requires coordination of their efforts. The following are principles of the formation of an innovation strategy which can be used in Azerbaijan:

- The strategy of "building up" - uses its own scientific, technical, production and technological potential with the involvement of foreign experience. With rational use of the results of fundamental and applied science to increase the production potential, the output of new competitive products expands, high technologies which are used in production and the social sphere are processed.

- The strategy of "borrowing" - uses the innovative potential of their own country, mastered the release of high-tech products produced in developed industrial countries. Further, production is increased on the basis of the development of scientific, technical and industrial potential, as a result of which there is an opportunity to independently carry out work on the entire innovation cycle - from creation to the sale of innovative products.
- The "transfer" strategy - foreign scientific, technical and industrial-technological achievements in the country's economy are used by purchasing licenses for highly efficient new technologies for mastering the production of new generations that are in demand abroad. Subsequently, the country develops its own scientific, technical and industrial potential, ensures the restoration of the entire cycle - from basic research and development to the production and sale of competitive products in the country's markets and abroad.

It should be noted that a common moment for all these strategies is the intensification of innovation activities and the achievement of new economic frontiers. The difference in strategies is determined by the financial, material and technical capabilities of the state and the ratio of the achieved levels.

6. CONCLUSION

The transfer of the Azerbaijani economy to an innovative development path requires the development of state innovation policy aimed at the effective use of national resources along with the use of foreign innovation technologies, managerial experience and financial resources. To assess the role of science and technology in social progress, the formulation and implementation of national goals a new approach is required. Only in this case the state policy in the sphere of science and innovations will be the priority direction of its activity. Science should constantly be used to assess the state of the domestic economy, analyze the consequences of government decisions, program and forecast economic and scientific and technological development. It should be noted that a rational combination of public and private sectors in some cases will allow to use effectively the basic elements of the strategy of "borrowing", since the scientific and technical potential of the country has not been lost, that will intensify innovation, increase the production of high-tech competitive products. The same conditions and limitations are characteristic for the "build-up" strategy. It can be successfully applied in individual industries of the real sector of the economy and the military-industrial complex. The use of the "transfer" strategy in Azerbaijan is rather difficult due to the limited resources and the unsatisfactory state of the domestic material and technical base of production. The strategy of the state innovation policy of Azerbaijan should be built differently for the industries of the real sector of the economy and for industrial production, i.e. maximize competitive advantage. The priority of the chosen innovation strategy should be quickly recouped innovative projects in implementation of which the state can jointly participate on a share basis with private investors, taking on some of the risks. To develop an innovation strategy that takes into account the current state of the Azerbaijani economy, it is necessary to create:

- An innovation system that accumulates and analyzes the experience of innovation (monitoring) in various sectors of the economy;
- A permanent interdisciplinary working group on the development and formation of the concept of an innovative strategy;
- The interdisciplinary intellectual center analyzing the condition of the innovation process in Azerbaijan and in the industrialized countries of the world in order to develop tactics and strategies for solving innovative situations.

The problem of formation of innovation policy has such an important aspect as the development of an innovative strategy for the future, which should be formed not only taking into account the existing conditions and own interests, but also taking into account the interests of developing innovation policy for a sufficiently long period of time. In modern conditions and in the future, maximizing the innovation factor becomes the decisive condition for the sustainable development of modern economic systems.

NEW HUMAN-MACHINE RELATIONS REQUEST A NEW PARADIGM: UNDERSTANDING ARTIFICIAL INTELLIGENCE

Jolan Velencei

*Keleti Faculty of Business and Management, Obuda University
Velencei.jolan@kgk.uni-obuda.hu*

ABSTRACT

We make decisions based on our aspirations. We don't choose between experiences; we choose between memories of experiences. And even when we think about the future, we don't think of our future normally as experiences. We think of our future as anticipated memories. And basically, you can look at this, you know, as a tyranny of the remembering self, and you can think of the remembering self-sort of dragging the experiencing self through experiences that the experiencing self doesn't need. This paper demonstrates how to build a knowledge-base which contains a decision-maker's aspiration. Our environment, the context of the decision, can only affect what is stored in our long-term memory (LTM). We retrieve what is in our LTM through the working memory (WM). Organizing our aspirations can be supported by an artificial intelligence (AI) algorithm. We developed a Knowledge-based System shell, namely Doctus KBS. It can generate a Case-Based Graph classifying the cases acquired from the domain expert. This Graph does not show dependencies, but the if-then rules induced by processing the cases. The if-then rules may be read from the root of the graph towards its leaves, where the value of the outcome is shown. The storing of experience in knowledge-bases and the discernment of the if-then rules serve the necessary sharing of knowledge. It would be useful if the recognition of thinking patterns and the if-then rules between aspirations were included in smart tools. The great benefit of the Case-Based Rule Reasoning is the reduced size, i.e. the significantly decreased number of the attributes. In the old paradigm it is a question of what AI can still know. The new paradigm could be the question of how working memory could make up deficiencies.

Keywords: *Artificial Intelligence, Decision maker's mind-set, Expert System*

1. INTRODUCTION

Organizations where people work cannot change faster than their people. Based on the currently dominant paradigm, the slow, clumsy and easily exhausted human receives a machine, which will allow the ceaseless and fast production of something (Baracskaï, Dörfler, 2017). Production doesn't just mean consumer products, but also Excel tables or operation control models. People can only be taught to make machines and then to be able to operate them. Few believe that an Artificial Intelligence (AI) algorithm should be anything other than a tireless and flawless manual worker. AI algorithm development is currently in its normal, puzzle-solving phase, and a paradigm shift is not on the horizon, as AI is currently touted and pampered. This does not lead to AI algorithm users being ready for a paradigm shift where they can redefine the human-machine relationship (Varga, Velencei, 2018). As long as people are assigning their defined operations to machines they designed, it is the same people's resistance to the paradigm shift that will define the working speed of an organization.

2. PARADIGM SHIFT: AI ALGORITHMS CANNOT DECIDE THEIR OWN LUCK

As long as we are stuck in the same paradigm of the human-machine relationship, nothing will happen other than the speeding up of current processes. The research of the human-machine relationship is in its pre-paradigm age, and we have been unable to recover from the victory of the management theory of Frederick Taylor in the past hundred years. "For they do disappear to a very considerable extent and then apparently once and for all.

Furthermore, their disappearance is usually caused by the triumph of one of the pre-paradigm schools, which, because of its own characteristic beliefs and preconceptions, emphasized only some special part of the too sizable and inchoate pool of information” (Kuhn, 1970, p. 17). If, however, the human-machine relationship is also in a normal phase, then we must await the revolution. This means new questions are needed. The easiest answer seems to be, that AI is unable, and will remain so, to tell whether it is time for the paradigm shift or not; in other words, an AI algorithm cannot decide its own luck. Let this be the argument to support that an AI algorithm cannot introduce itself into a system. It is not hard to imagine that resistance towards those trying to instigate a paradigm shift will grow, especially when more delicate questions come up. In the old paradigm, it is a question of what AI can still know. Concepts and the methods themselves are still from the old textbooks, and only heretics dare tamper with an elegantly solved puzzle. We never needed to fear, nor do we need to now, that the old solutions become useless; it is possible, that they were already useless. They seemed to work, but not anymore. The new paradigm could be the question of how working memory could make up for deficiencies. Let us look at this idea through the lens of Agile Project Management. Agile Project Management can succeed better in a culture that “thrives on chaos” than in one that “thrives on order” (Highsmith, Cockburn, 2001). If deadlines, outputs and costs have to be pre-defined, then the project cannot have more outcomes, depending on whether stakeholders would redirect the development mid-stream. The positivist paradigm by itself may not be too limiting to understand the basic questions of human-machine relations such as (1) does AI lend any support for non-algorithmic processes, such as Agile Project Management and (2) will people accept that super-fast AI algorithms will be able to replace the bottleneck of natural intelligence and working memory, and nothing else. “Effective research scarcely begins before a scientific community thinks it has acquired firm answers to questions like the following: What are the fundamental entities of which the universe is composed? How do these interact with each other and with the senses? What questions may legitimately be asked about such entities and what techniques employed in seeking solutions?” (Kuhn, 1970, p. 4). Commitment to deterministic processes strengthens resistance. “Normal science, for example, often suppresses fundamental novelties because they are necessarily subversive of its basic commitments. Nevertheless, so long as those commitments retain an element of the arbitrary, the very nature of normal research ensures that novelty shall not be suppressed for very long” (Kuhn, 1970, p. 5). During a phase of normalcy, members of the community converse undisturbed. “These doubts about progress arise, however, in the sciences too. Throughout the pre-paradigm period when there is a multiplicity of competing schools, evidence of progress, except within schools, is very hard to find. This is the period described in Section II as one during which individuals practice science, but in which the results of their enterprise do not add up to science as we know it. And again, during periods of revolution when the fundamental tenets of a field are once more at issue, doubts are repeatedly expressed about the very possibility of continued progress if one or another of the opposed paradigms is adopted” (Kuhn, 1970, p. 163). If we define the word researcher narrowly, then the work is reduced to measurements and re-confirmation of existing rules. In our definition, a researcher is looking for new conceptual models. AI can provide help in transforming planned development processes. If one is able to wriggle out of the dominant schools of the pre-paradigm age, or of ‘normalcy’, where the question will not be about how to cut costs, then perhaps a development process will last as long as it needs to.

3. TENTATIVE SOLUTION: UNDERSTANDING WORKING MEMORY

Popper (1972) originally conceptualized the Tentative Problem-solving process when he recognized the following model:

$$P_1 \rightarrow TT \rightarrow EE \rightarrow P_2 \rightarrow$$

As Popper explained P_1 is the initial problem situation, TT is the first tentative solution, which is followed by EE, namely error elimination. In this phase there are some rival solutions which are needed critical examination. P_2 is the new problem situation so this phase the critical discussion arises. In this paper, new solutions to human-machine relations are being tentatively seeking in the field of Agile Project Management. When a paradigm shift happens, the old textbooks touting the old paradigm puzzle solutions are replaced. New books will shift focus onto forming new questions. If we look at the journals of human-machine relations, we see no movement or shift: the most influential academic journal, the *Computers in Human Behavior* dedicated to examining the use of computers from a psychological perspective, fills its issues with tiny measurements. Some books and/or TED talks are braver. Nick Bostrom Swedish philosopher in his TED2015 talk he said that “Now most people, when they think about what is smart and what is dumb, I think have in mind a picture roughly like this. So, at one end we have the village idiot, and then far over at the other side we have Ed Witten, or Albert Einstein, or whoever your favourite guru is. But I think that from the point of view of artificial intelligence, the true picture is probably more like this: AI starts out at this point here, at zero intelligence, and then, after many, many years of really hard work, maybe eventually we get to mouse-level artificial intelligence, something that can navigate cluttered environments as well as a mouse can. And then, after many, many more years of really hard work, lots of investment, maybe eventually we get to chimpanzee-level artificial intelligence. And then, after even more years of really, really hard work, we get to village idiot artificial intelligence. And a few moments later, we are beyond Ed Witten. The train doesn't stop at Humansville Station. It's likely, rather, to swoosh right by” (Bostrom, 2015). The AI algorithm-based Watson could win the Jeopardy Quiz Show (Saran, 2017). This means that it is able to search faster in its databases. Many AI-based algorithms, including Doctus KBS, are able to learn from experience (Velencei, 2017). The point is, that a machine learning algorithm will never have original ideas, it will only be faster. With certain algorithms, such as chess computers, there will not be much human resistance, but it will not open new windows for new questions, either. No matter which way we look, we end up in the same place. AI-based learning algorithms are able to improve human working memory. Our memory also tells us stories, in other words, what we have kept from our experiences is the story, as Daniel Kahneman the world's most influential living psychologist said in his TED2010 talk (Kahneman, 2010). He won the Nobel in Economics for his pioneering work in behavioral economics in says in 2002. It would be a mistake to think about supplementing our long-term memory (LTM) with a computer memory, as the problem is not storage. It does not matter whether we cannot search in our LTM or on the hard drive of the computer. The searching and organizing itself is the bottleneck. Following the dominant paradigm, the clumsy, slow and tired man gets a machine to quickly and capably build something. Humans can only be taught to construct the machine and then operate it. A decision-support tool is better when it listens and “thinks” more and talks less. It is a false belief that the more data it provides, the better it is. Currently existing and continuously constructed knowledge-bases allow the observation of the emergence of certain thinking patterns which describe the experiences of the decision-maker. The recognition of these patterns leads to decisions becoming transparent and explainable. It is impossible to improve humans in the area of LTM, and so AI will have no role to play there. The ever-growing masses of data, such as those available from the internet, are searchable and storable without AI. No matter how we approach it, we will find ourselves at the conclusion: AI-based algorithms are able to improve human working memory. Well, Agile Project Management is also a way of improving human intelligence, more specifically, human working memory (WM). “The process is transparent to everyone. Team members hold brief daily “stand-up” meetings to review progress and identify roadblocks.

They resolve disagreements through experimentation and feedback rather than endless debates or appeals to authority. They test small working prototypes of part or all of the offering with a few customers for short periods of time. If customers get excited, a prototype may be released immediately, even if some senior executive isn't a fan, or others think it needs more bells and whistles. The team then brainstorms ways to improve future cycles and prepares to attack the next top priority" (Rigby et al., 2016, p. 43). It is hard to understand why there is large resistance in this field, even though we have demonstrated noteworthy results over the past thirty years. It is unimaginable that the knowledge of a single expert would be enough for the functioning of all business processes within a company. The building of knowledge-bases inspires decision-makers to talk to each other and to share knowledge. It can be a quick way of finding out which decision-makers are indispensable and irreplaceable. We should take good care of them! "That doesn't mean that computers now have tacit knowledge, or that they've started to think the way we think, or that they'll soon be able to do everything people can do. They don't, they haven't, and they won't. Artificial intelligence is not human intelligence. People are mindful; computers are mindless. But when it comes to performing demanding tasks, whether with the brain or the body, computers are able to replicate our ends without replicating our means" (Carr, 2014, p. 25). The next steps of tacit probing will be on the foundation of WM augmentation with machine learning and its understanding.

4. ILLUSTRATION: BUILDING A KNOWLEDGE BASE BY DOCTUS KBS

Currently existing and continuously constructed knowledge-bases allow the observation of the emergence of certain thinking patterns which describe the experiences of the decision-maker. The recognition of these patterns leads to decisions becoming transparent and explainable. It is unimaginable that the knowledge of a single expert would be enough for the functioning of all business processes within a company. The building of knowledge-bases inspires decision-makers to talk to each other and to share knowledge. It can be a quick way of finding out which decision-makers are indispensable and irreplaceable. We should take good care of them! In this study a projects evaluation is used for illustration. The interviewed experts had a lot of experiences in managing projects, so they after finishing them they could tell the Knowledge Engineer the result: 'failed', 'had partially attained objectives', 'was successful' and 'agile'. "An experienced decision maker is capable of organizing their knowledge into knowledge bases with the help of a Knowledge Engineer" (Velencei, 2017, p. 869). The aspects of the knowledge domain, which are called attributes in Doctus KBS, are listed on the «Attributes» pane as Figure 1 depicts. Each attribute consists of its name and its values to define the categories of the aspect. The values are symbols (i.e. words or expressions), for numeric aspects of domains a clustering algorithm is provided to transform them into symbols. The objects of the knowledge domain (i.e. the decision alternatives), which are called cases in Doctus KBS, are listed on the «Cases» pane.

Figure following on the next page

Name	Value 1	Value 2	Value 3	Value 4
Project	failed	had partially attained objectives	was successfull	agile
Project goals	were not met	were partially met	all objectives met	exceeded expectations
Quality measures	poor	average	top	
Time	late	on time	early	
Cost	over budget	on budget	under budget	
Satisfaction of the initiator	dissatisfied	partially satisfied	satisfied	
Satisfaction of affected	dissatisfied	satisfied		
Project manager competency	not prepared yet	reasonably effective	excellent	
Project team competency	incompetent	competent		
Communication with team	rare	issue based	professional	professional and informal
Communication with impacted	rare	too frequent	professional	
New knowledge creation	none	some	bingo	
Improving skills	none	some	genious	

Figure 2: Attributes in Doctus KBS (Screenshot by author)

Each case has a name and a case feature for each attribute to categorize the cases according to the aspect represented by the all attributes. Figure 2 depicts some four cases. At the end the interviewed experts evaluated 32 projects.

	1	2	3	4	5
Project	failed	had partially attained objectives	had partially attained objectives	had partially attained objectives	had partially attained objectives
Project goals	were not met	were partially met	all objectives met	were partially met	were partially met
Quality measures	average	average	average	average	poor
Time	late	on time	late	late	late
Cost	on budget	on budget	on budget	over budget	on budget
Satisfaction of the initiator	dissatisfied	dissatisfied	satisfied	dissatisfied	dissatisfied
Satisfaction of affected	satisfied	dissatisfied	dissatisfied	dissatisfied	dissatisfied
Project manager competency	not prepared yet	reasonably effective	not prepared yet	reasonably effective	not prepared yet
Project team competency	competent	incompetent	incompetent	incompetent	competent
Communication with team	professional	rare	professional	issue based	rare
Communication with impacted	too frequent	too frequent	rare	rare	too frequent
New knowledge creation	none	none	none	none	none
Improving skills	some	some	some	some	some

Figure 3: Cases in Doctus KBS (Screenshot by autho)

Doctus KBS generates the Case-Based Graph classifying the cases acquired from the experts. The Case-Based Graph is a decision tree; it does not show dependencies but the if-then rules induced by processing the cases. The if-then rules may be read from the root of the graph towards its leaves, where the value of the outcome is shown (See Figure 3). For example if you read from the left side on the graph the if-then rules are:

- If Satisfaction of the initiator is dissatisfied and
- If the Project goals were not met
- Then the project was failed.

And if you read from the right side on the graph the if-then rules are:

- If Satisfaction of the initiator is satisfied and
- If the Project goals are exceeded expectations
- Then the project was agile.

Figure following on the next page

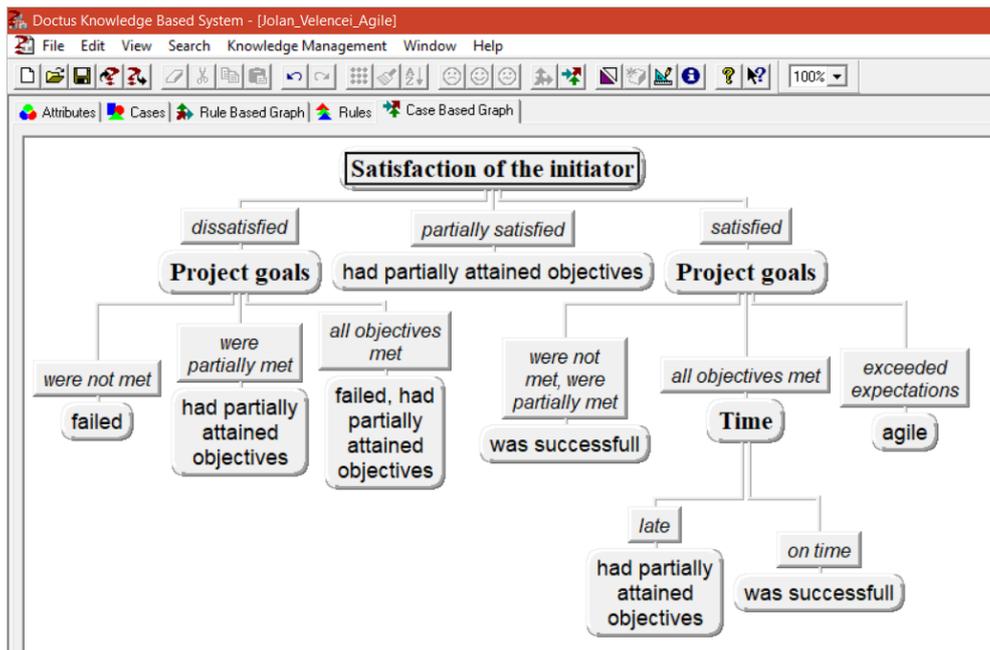

Figure 4: Case-Based Graph in Doctus KBS (Screenshot by author)

Once the experts accepted the Case-Based Graph, a new Rule-Based knowledge base can be created, which contains only the informative attributes but gives the same evaluation for the cases as the ones used for the induction of rules (Baracskaï, 2017). The reasoning uses rules but they are induced from the set of cases, thus this type of reasoning is called Case-Based Rule Reasoning. As the knowledge base is generated automatically by reducing an existing model, it is also called reduction. It is easy to reason about new cases using the Case-Based Graph as well: the new case simply has to be positioned according to its features by the informative attributes. These attributes in this sample are Satisfaction on the initiator, Project goals and Time. Evaluation of new cases in Doctus KBS is facilitated with reduction. The result of reduction means that we know our informative or may I say relevant attributes so we can previously evaluate our future decisions. Figure 4 depicts the extract rules. The star (*) representing “Don’t care”. For example the last row means:

- If Satisfaction is satisfied and
- If Project goals are exceeded expectations and
- If values of Time don’t care
- Then Project should be agile.

Satisfaction of the initiator	Project goals	Time	Project
dissatisfied	were not met	*	failed
dissatisfied	were partially met	*	had partially attained objectives
dissatisfied	all objectives met	*	failed had partially attained objectives
partially satisfied	*	*	had partially attained objectives
satisfied	were not met, were partially met	*	was successfull
satisfied	all objectives met	late	had partially attained objectives
satisfied	all objectives met	on time	was successfull
satisfied	exceeded expectations	*	agile

Figure 5: Extract rules in Doctus KBS (Screenshot by author).

If during the fine-tuning of the reduced knowledge base implied changes of attributes and/or values, these changes should be applied to the Case-Based knowledge base as well, and the Case-Based Reasoning should be repeated. Fine tuning the Case-Based Rule Graph and using it as feedback some elements of the tacit knowledge can be acquire. “That doesn’t mean that computers now have tacit knowledge, or that they’ve started to think the way we think, or that they’ll soon be able to do everything people can do. They don’t, they haven’t, and they won’t. Artificial intelligence is not human intelligence. People are mindful; computers are mindless. But when it comes to performing demanding tasks, whether with the brain or the body, computers are able to replicate our ends without replicating our means” (Carr, 2014, p. 25).

5. DISCUSSION

Whether still solving puzzles (before the new paradigm) or beyond them (revolution), new concepts, taxonomies and rules may emerge. It is impossible to achieve anything in the field of Agile Project Management if we are stuck in the cage of the old concepts, taxonomies and rules, and are seeking an optimal process answer. We have come to understand how the human-machine algorithm may be described according to the most informative expectations and have examined some projects. With the Doctus KBS learning algorithm, we were able to demonstrate some mind-set patterns. We have come to understand the things that would have remained stuck in LTM without the machine support of WM.

ABSTRACT

The possibilities of knowledge auditing in the conditions of the formation of the information society are discussed and systematized in the article. The peculiarities of development of methodology, organization and tools of knowledge audit that meets the modern needs of business audit development are evaluated. The question at issue is also that the audit of formalized knowledge fundamentally differs from the audit of non-formalized knowledge. As one of the main areas of business audit, knowledge audit is highly professional consulting services in a wide range of subject areas of economic, financial, legal and many other areas of modern business. Research of the demand for the specified direction of audit in the world community has shown that the lack of a coherent methodology impedes the decision to conduct knowledge audit. The article investigates modern approaches that allow combining the capabilities of modern business audit in general and information audit of information systems, operational audit, intellectual capital audit and knowledge audit in particular. The conclusion is that the merger of these types of audits into a single business audit shows a significant business effect. The practical significance of the article is that the conclusions and proposals are aimed at strengthening the role of the modern audit and contribute to the real optimization of modern business. The study conducted by the authors revealed that the new reality of the XXI century has changed the attitude to the traditional audit, requiring justification of the business effect in the implementation of new information systems and modernization of old ones, moving from complex automation of business processes to specialized solutions. Despite this, the demand for the development of business and IT-strategies and feasibility studies is steadily growing. Projects on the use of corporate knowledge at all levels of management are coming to the fore.

Keywords: *Knowledge audit, knowledge, corporate memory, knowledge management system, formal knowledge, informal knowledge, reengineering, optimization, intellectual capital, intangible assets, knowledge assets*

1. INTRODUCTION

In the context of the evolutionary transition of the world community from post-industrial to information development, modern business seeks to improve and strengthen its capabilities by strengthening the emphasis on modern and progressive management methodology, the so-called knowledge management methodology.

At the same time, the successful implementation of the knowledge management system (KMS) in the business is realized primarily in business systems, which with special attention relate to such aspects of the problems facing them as human and cultural, motivation of employees, changes in management methodologies, optimized business and IT processes that ensure the full exchange of knowledge between professionals with adjacent and sometimes completely unrelated competencies, exchange, continuously growing in volume and in time, information, as well as mutual collaboration. In general, the KMS is a set of conceptual apparatus, subject disciplines and tools for the organization of knowledge that allow managers to take responsibility for corporate knowledge and, on their basis, for effective management decisions. Increased use of knowledge by managers nowadays leads to the accumulation of valuable assets, improves its ability to make and implement effective management decisions. In practice, knowledge is divided into formalized, expressed in objects, words, numbers, graphic forms, drawings, specifications, textbooks, procedures, etc. and non-formalized, representing theoretical models, behavior and perspectives patterns, based on empirical data. However, to date, all efforts aimed at creating modern KMS in business, are limited, as a rule, only to the promotion of individual information technologies (IT) related to the introduction of modern software products allowing the solution only of certain aspects of this problem. In some cases, in the most developed business systems, these technologies are combined into a single information system for business of various levels of development. At the same time, the level of development of various information systems in different business systems is ambiguous and requires a permanent study of their condition and optimization. In the era of modern and very rapid changes of the XXI century, the transition to the information society, the old approaches to management, which guarantee the success of business for a long time, can not stop the gradual decline of its stability as internal contradictions and external threats from a very aggressive competitive environment. Static, not developing in time corporate memory becomes for business more and more distorted representation of the future, and the rules and procedures established in the business system begin to lose their importance in a permanently developing competitive environment (Gibbert M., Leibold M., Probst G. , 2002, 459-469). In this context, corporate memory is understood as an implicit or explicit in the business system interpretation of business processes or manufactured products, goods or services. At the same time, "Companies, along with people, remember the past, including old processes and procedures, as well as corporate traditions and values." (Tom M. Koulopoulos, Carl Frappaolo, 1999, p. 114). Being in such situation, business often initiates radical transformations, based on reengineering, rebuilding their business and IT processes as well as business strategies for new economic conditions, the contemporary challenges and threats and at the same time destroying the established inner potential of their business systems. Thus, in the process of such business transformation management systems make a huge mistake, replacing outdated (in their opinion) at the moment corporate memory with new knowledge and practically stop there. No one will deny that for reengineering is characterized by a time-fixed view of the problem situation which undoubtedly leads to the fact that management decisions soon manifest themselves in the form of new and much more complex problems. This is mainly due to the inability to take into account the characteristic for modern markets, continuously progressive, and very rapid changes occurring in the competitive environment (Tom M. Koulopoulos, Carl Frappaolo, 1999, P. 114). As a result, this knowledge also very soon becomes outdated. According to famous scholars and practitioners Thomas M. Kulopoulos and Carl Frappaolo and what we can not but agree, the power of modern business of the XXI century is not in the knowledge that were used in the past and obsolete, "...but in the ability to continuously update the repository of corporate wisdom and to use its content for new purposes" (Tom M. Koulopoulos, Carl Frappaolo, 1999, P. 12). If the management system in modern conditions comes to the conclusion that it is necessary to use tools that allow the business system to get rid of its static

corporate memory, then we can safely assume that it is obvious for the system that at best reengineering provides only short-term success in the competitive environment for any business. And since, as part of a business strategy, the conditions of a permanently changing market are considered static to change, very soon the information from their repository, along with products and procedures, also becomes outdated. Unlike reengineering, KMS implies a constant readiness of the business to management impacts, stimulates permanent transformations and innovations at a speed that at least corresponds to the pace of modern development of the competitive environment. In order to remain successful and sustainable in today's constantly changing competitive environment, it is necessary to continuously accumulate historical knowledge and expand it in accordance with the demands of the future market, transforming corporate memory into corporate wisdom (Tom M. Koulopoulos, Carl Frappaolo, 1999, P. 116). In modern conditions, the cost of the products or services provided is determined not only by the spent physical resources, but also by the technologies used for this, as well as the scientific developments behind their production. Thus, a new, intangible form of resources - intangible assets - appears in business. At the same time a number of scientists and practitioners in the field of management have recently used the term "intellectual capital" of business to designate them (Novgorodov P.A., 2017, P.P.38-49). Intellectual capital can be defined as a set of all knowledge of an individual business's employees, ensuring its resistance to permanent challenges from the competitive environment, or as a set of intangible assets of an individual business that can be used to create the value of a consumer result. In the XXI century it has already been recognized that, as it was noted earlier, knowledge becomes the dominant means of achieving high social-economic results. The definition of knowledge as a business asset and, accordingly, the existence of the need to manage this type of asset are shown in the works of economists and practitioners in the field of management. Intellectual capital determines the competitiveness of business even in the conditions of the information society and thus becomes one of the key resources. For example, a well – known scientist in this subject area Thomas Stewart understands intellectual capital as all the knowledge of business, which can be considered an asset, and identifies in its structure three main elements-human, structural and consumer capital. At the same time, human capital is the knowledge, skills and creative potential of business employees. In addition, here, in his opinion, the culture of interpersonal relations should relate. Structural (organizational) capital – patents, licenses, trademarks, brands owned by a particular business, as well as hardware and software, organizational structure and methods of organization of business and IT processes. Consumer (client) capital is an information base about the clients of a particular business, including the evolution of relationships with them, as well as collaborations (Stewart T. A., 2001). In his turn, Karl-Eric Sveiby suggested his own approach to the consideration of elements of intellectual capital. In his opinion, it is necessary to define the competence of employees, the internal and external structures in it (Sveiby K.E., 2004). At the same time, under the competence of employees, a scientist means their abilities, including their education, qualification, experience, attitude to their functions and to the business in which they work. This element of intellectual capital depends on certain employees, and in the case of their departure from the business, the competence leaves with them. At the same time, the internal structure is nothing more than intangible assets owned by a certain business, giving it the opportunity to satisfy customer preferences. The internal structure usually includes business strategy, patents, know-how, information systems, information databases, organizational structure and documented business and IT processes. Finally, the external structure is the business relationship with counterparties. The external structure includes brands, trademarks, and image belonging to a particular business (Sveiby K.E., 2004). At the same time, it should be mentioned that these scientists do not quite clearly relate the objects of intellectual capital to a particular element of it. Thus, for example, Karl-Erik Sveiby considers the attitude to work to be the competence of the

employees, but the attitude to work is considered to be a part of the corporate culture of the business. The latter is referred to the internal structure (Sveiby K.E., 2004). This approach in its essence complicates the practical use of these theories for the formation and application of KMS. At the same time, these approaches to the definition of elements of intellectual capital can be used to value its status in a particular business and can be used as a starting point in the development of business strategy and management policy, as well as its development. Choosing one of the above as a working model, it is possible in the context of one business to develop a classification of intellectual capital objects for the purpose of subsequent control over them and develop on its basis ways of development of intellectual capital management. Nowadays, the theory of knowledge management has the greatest practical value in subjects of knowledge-intensive industries, for example, oil and gas, high-tech industries, in research and development business, in subjects whose business is associated with the provision of services that require highly skilled professional labor, for example, auditing, consulting companies, legal business, etc. At the same time, as it was mentioned earlier, without high-tech control it is impossible to assess the effectiveness of functioning of KMS in noted subjects. In the economy of the XXI century, the list of business systems whose success depends on the proper attitude to their knowledge is constantly enlarging. In huge business systems, there are separate structural units that are engaged in developing a new consumer result (products, goods or services), bringing them to the market, researching the market for their own consumer result, selling high-tech products, managing relations with counterparties. The knowledge of the employees of these structural business units is of great importance for the entire business [6]. The construction of modern efficient KMS allows to solve the problem of the distribution of the knowledge system among the interested business units, as well as among its regionally divided employees. KMS plays a special role in large, geographically distributed business systems with hundreds and thousands of employees. They inevitably have employees who perform similar functions and thus have different qualifications. KMS allows to use the experience and knowledge of successful structural units to improve the efficiency of similar functions of units in other business-owned geographical segments. With increasing attention to knowledge as the main organizational business asset and the creation of a special management system, it is important to understand how to measure, evaluate, account and monitor the effectiveness of management decisions and work performed on their basis in the new, non-traditional system of management of conceptual apparatus, policies and procedures. In addition, it is also important to continuously assess the impact of KMS on the business as a whole and its individual units. In the conditions of the information century, taking into consideration the needs of market participants, a preventive consistent and at the same time independent control of the entire asset of knowledge is necessary, focusing not only on the past but also on the present and especially on the future of the controlled business, erasing the boundaries between direct control functions and management consulting.

2. AUDIT OF NON-FORMALIZED KNOWLEDGE

According to well-known foreign scholars and practitioners, and with whom we can not but agree, the most acceptable tool that allows to professionally implement these functions in their asset is a modern audit, but not a traditional audit of financial statements, but a business audit in general (Tom M. Koulopoulos, Carl Frappaolo, 1999). It is business audit that includes the knowledge audit as a separate area. At the same time, the audit of knowledge in this context should be understood as a systematic independent scientific audit research of corporate knowledge, both past and present, and especially future (corporate memory and corporate wisdom) and the development of management recommendations for the business management system based on its results. In general terms the specified direction of the audit involves the performance of an audit of non-formalized directions, as well as special knowledge and

competencies of the employees of the business system and its corporate culture. It should be taken into account that the audit of formalized knowledge can be considered an audit of information, which examines explicit sources, documents, files, etc. In addition, the audit of knowledge in the XXI century can be considered as a key component of management decision-making regarding maintaining business stability in an aggressive and continuously changing competitive environment, investing, and developing new projects in terms of improving the KMS. At the same time, the starting point of business evaluation before the introduction of KMS, as well as other business initiatives in this area, is the audit of corporate memory (audit of the past, established in the business-system knowledge) of this system. According to the data of the specialist in the field of knowledge audit Ann Hylton, only 15% of developments on knowledge management are completed with adequate results (Andrusenko T.B. , 2007). At the same time, the main reason for failures in the implementation of KMS in business is the lack of prior knowledge audit. Without a prior knowledge audit, auditors are unable to identify the key business knowledge in its corporate memory. In addition, the lack of a coherent business audit methodology in general does not allow them to determine the proper approaches to identify the knowledge that is necessary for a particular business in the current time period, and, most importantly, in the current rapidly changing competitive environment, and especially in the strategic perspective. Therefore, auditors are not able to prepare specific and appropriate management recommendations for knowledge management for any modern business. At the same time, we can confidently claim that knowledge audit at the present stage of the development of business audit in general is a very complex and time-consuming scientific audit research, requiring high professionalism and competencies from the auditors themselves. In this case, it is necessary to constantly take into account that the goals in each specific audit assignment may be different and their achievement in auditing research of business knowledge is ambiguous. According to scientists and experts in the field of audit, knowledge audit should be carried out in the following cases:

- during the development of a business strategy in the field of knowledge management;
- when there are some significant difficulties in finding the necessary information or a competent specialist-expert in a particular subject area;
- when there is a duplication of information and knowledge gathering;
- when there are doubts about the value of any initiative related to the use of the information system, investments in certain programs or business projects;
- when there is a relatively low efficiency of implementation of the results of scientific research and experimental development (SR & ED);
- during the reorganization of the business, its merger and acquisition.

Thus, it can be stated with confidence that the knowledge audit conducted as part of a business audit can provide management recommendations for making management decisions at almost all stages of any business functioning.

During the conducting of knowledge audit, the auditor may:

- determine organizational aspects and readiness of business for non-traditional transformations;
- work out management recommendations for the development, adequate to the requirements of the competitive environment, business strategy in the field of knowledge management, creation or development of existing KMS;
- identify hidden reserves of non-formalized knowledge for further effective use by the management of the studied business;
- determine the structure of intellectual capital of the business and establish the most effective methods and procedures for its evaluation;

- identify and assess the probable loss of knowledge due to employees leaving the business;
- identify potential opportunities of creation the groups of the most competent practitioners in the business, producing certain knowledge;
- systematize the identified knowledge assets and develop an appropriate methodology for their assessment for management.

At the same time, it should be remembered that, in contrast to the traditional, generally accepted audit of financial reports, which mainly apply quantitative indicators for evaluating the effectiveness of management decisions based on standardized auditing procedures, it is necessary to use not only quantitative (formalized knowledge research) but also quality indicators based on the comprehensive use of heuristic methods, which are a special group of methods of collecting and processing data and information. Herewith, these methods are based on the professional judgment of a group of experts in various subject areas of the business being studied. In order to conduct knowledge audit, it is necessary to carry out a significant amount of work to create appropriate conditions for the preparation of the information base. At the same time, the fundamental task is to form in business an appropriate understanding of the importance and permanence of carrying out to improve the efficiency of KMS. In the theory and practice of audit it is generally accepted that the audit cycle for performing an audit task is traditionally implemented in three phases: planning, audit of the audit task itself and, finally, creation of accounting documents on its results. The implementation of these stages is not an exception in business audit in general and knowledge audit in particular. However, their content has its own specificity, inherent only in knowledge audit, and is determined mainly to the subject areas under study. The process of knowledge audit, like any other direction of audit, is a logical sequence of procedures performed by the auditor with the involvement of competent experts in a particular subject area in order to identify and assess the corporate memory and corporate wisdom of the business, and, as a result, the preparation of appropriate management recommendations for their effective use by business management. Thus, knowledge audit must pass all three of the above main stages, namely:

- planning of audit research;
- audit of the audit task;
- preparation of reports and appropriate management recommendations.

However, the specifics of knowledge audit, as well as the existing opinions of scholars and practitioners in the field of auditing, show that due to the fact that the main task of this audit study is to identify and evaluate probable reserves of knowledge, to optimize the functioning of a business, and to develop appropriate management recommendations, consequence, the auditor should ensure the irreversibility of the process of implementing these recommendations. Therefore, the next, and at the same time, a very significant stage in the audit of knowledge, should be considered as the stage of implementation of the results and audit management recommendations. And finally, knowledge audit cannot be considered complete if the auditor has not received sufficient and appropriate information on the impact of the implementation and use of business management recommendations based on the results of the audit. This stage can be defined as the stage of determining the effect obtained from the use of the results of knowledge audit. Thus, it should be recognized that the full cycle of knowledge audit is implemented in five stages from the planning stage to the results from the implementation of management recommendations. It should be mentioned that an important component of the knowledge audit, as it was earlier, is the individuality and atypicality of each studied business, its goals, as well as the need for close cooperation with its employees and the involvement of experts in various subject areas. Therefore, at the planning stage first of all it is necessary to assess the condition of KMS of the business system.

For this purpose, according to a number of scientists and practitioners, as well as the conducted studies suggest that the use of Capability Maturity Model proposed by the Software Engineering Institute by the US Department of Defense for classification and evaluation of projects related to software development and guaranteed quality compliance in the implementation of these projects (Kozlova I.V., 2016, P.P. 38-40). Assessment of knowledge by an auditor, built on Maturity Models, may serve as a qualitative component of the development of management recommendations for the practical implementation of the current and strategic management of the KMS in general and its constituent elements in particular (Andrusenko T.B., 2007). At the same time, compliance with one or another level of the Model allows to determine the readiness of a business for modernization or renewal. These models allow the auditor to determine the fundamental actions that will give answers to what needs to be done during the audit on the substance of the audit assignment, as well as to establish the condition in which KMS of the business is located. Taking as a basis the scale of Maturity Models, which is based on determining the level of development of the business and IT system as a whole and its KMS in particular from non-existent (level 0) to optimized (level 5), the auditor can determine:

- the current state of the business and its KMS, that is, to assess at what stage they are at the current time at knowledge management;
- the current status of the best practice in knowledge management in the industry in which the studied business operates, that is, to compare the specific subject studied by the auditor and its KMS with the best subject in the industry;
- the current status of the business and its KMS based on leading international practices;
- the status of the business and its KMS after their intended improvement, that is to evaluate its business strategy for the results that it seeks to achieve in the field of knowledge management for the long term.

After identifying critical points and weaknesses in the study area, Maturity Models allow the auditor to develop preliminary corrective recommendations and provide them to the management of the studied business. Then the auditor develops a strategy and tactics for taking the business in general and the KMS in particular to the desired level of knowledge management efficiency. It should be particularly noted that the nature and quality of the established relationship of the auditor with the managing and managed business systems depend on the conditions in which the audit of knowledge is implemented regardless of its thematic focus (general audit of knowledge, assessment of corporate culture, collection and systematization of non-formalized knowledge, interaction with business professionals leaving the business to identify their knowledge, the existing innovative aspect, proper training or retraining of business personnel, the effectiveness of the use of social networks, etc.). It is this approach to knowledge audit that will allow the most constructive implementation in the future of all management recommendations received as a result of the audit. Therefore, before the very beginning of the audit, it is necessary to:

- inform interested business employees about the aims and timing of the audit research;
- present to the management system the composition of the audit team and experts who are involved in the performance of the audit task;
- agree on all the powers to access any, including confidential information of the business and its key knowledge holders;
- to coordinate the duties and responsibilities of specific leading employees of the studied business and key knowledge holders;
- discuss the methodology for knowledge audit;
- answer all possible questions asked by employees of the business under study regarding the material aspects of the upcoming audit research.

At the same time, it should be borne in mind that before using Maturity Models, the auditor needs to identify the availability of knowledge resources and the needs of the business under study for additional knowledge assets. With this object, he needs to conduct an inventory of these assets, on the results of which he is to assess the level of the state of the business in general and its KMS in particular. When planning an audit of knowledge of a particular business, the auditor should take into account that it is necessary to subject virtually all its subject areas to an audit research. However, practice shows that the timing and scale of the upcoming audit does not allow to fully cover the entire business under study. Therefore, to improve the quality and efficiency of the audit cycle, it is necessary to preliminarily select the most significant aspects for the business, constantly supplementing and expanding the range of research both during the audit process on the substance of the audit task and in subsequent audit studies. This approach allows to optimize the resources available to the auditor during the detailed audit of business knowledge. Thus, it should be noted that the planning process should be carried out in three successive and correlated stages: preliminary planning (identification of significant areas of knowledge carriers for business), strategic planning (development of the strategy for the upcoming audit) and current planning (development of methodology and preparation of tools for the audit on the merits of the audit task). Despite the fact that each of these stages has its own characteristics and some effective individuality, however, their practical implementation is due to close interdependence, as any adjustments in one of them will necessarily lead to changes in the others. Therefore, when planning the audit of knowledge, it is necessary to follow the generally accepted principles of continuity, complexity and optimality. Starting the stage of a detailed audit on the merits of the audit task, as it was noted earlier, for the study of non-formalized knowledge, the auditor should provide for the possibility of using heuristic methods based on the admissibility, rationality and even satisfaction of the management recommendations prepared. The specified system of methods will allow to assess the qualitative indicators characterizing efficiency of functioning of KMS and as a result of management decisions. It should be considered that the use of heuristic methods for evaluation of non-formalized knowledge and KMS at a qualitative level when performing an audit of knowledge is due to:

- the qualitative nature of non-formalized knowledge;
- the significant uncertainty of the probability of their formalization;
- the current lack of technology that allows to construct and study a formalized model of this knowledge.

In this regard, the application of expert assessment methods (questioning, interviewing, etc.) by the auditor deserves attention. However, these methods require a special approach to the formation of a group of specialists-experts with the proper competence in the subject areas. At the same time, the group of specialists -experts can be both homogeneous and consist of specialists in various subject areas. At the same time, it is necessary to take into consideration that the practice of applying the indicated methods shows that their integrated application is mostly effective for solving one and the same problem. In addition to this, each of the methods, as it was noted earlier, involves some preparation for their implementation. Thus, for example, while performing interviewing of specialists-knowledge carriers it is necessary to make in advance some program of the conducted interview. However, in the course of the dialogue it is permitted to clarify and correct the program when there is some additional information. In addition to these qualitative methods aimed at identifying non-formalized knowledge, qualitative assessment of the KMS and management decisions made on their basis, during the audit of knowledge on the substance of the audit assignment, the auditor needs to conduct a study of knowledge flows, that is, to identify the relationships between employees, business and IT processes and technology.

These studies will reveal the inadequacy or duplication of certain knowledge, as well as best practices and barriers to the use of both formalized and non-formalized knowledge in the business system. It should be mentioned that these approaches implemented in the audit of knowledge, allow identifying the probable factors of the success of the business under study. To perform this, in the course of the audit study, it is necessary to focus not on a separate group of specialists of knowledge holders, but to try to cover the specialists of the entire business system. In this case, the key aspect is the assessment of factors that can either serve as barriers to the use of knowledge or contribute to the effective exchange of knowledge. Thus, it should be noted that a detailed knowledge audit allows us to determine patterns of knowledge flows in a business that form an idea of the information processing approaches used and, as a result, the efficiency of using and sharing knowledge in this system. Practice shows that according to the results of performed knowledge audit it is advisable not only to prepare a report and management recommendations, but also to carry out knowledge mapping. Knowledge maps are not only an appropriate way to capture and share formalized knowledge, but also a reflection of non-formalized knowledge with varying degrees of detail. These documents enable the management system of the studied business to understand what knowledge is necessary for certain business professionals. In addition, the maps allow sharing formal knowledge, which is inherently available information, from implicit, requiring a special approach to them from the KMS. According to Kozlova I.V., and with which it is impossible to disagree, the purpose of developing Knowledge Maps is the formation of specific documents as a new separate intellectual product, which in its essence is a source of knowledge, as they reveal the connections between knowledge sources or indicate gaps in existing knowledge assets (Kozlova I.V., 2016, P.P. 38-40). At the same time, one should not identify Knowledge Maps with knowledge storages, where the whole collection of business knowledge is stored directly. Knowledge maps are a kind of a guide to the above repositories, knowledge holders, knowledge sources, etc. The process of creating Knowledge Maps is focused mainly on the definition and planning of the KMS of any business [9, 10]. While creating Knowledge Maps for describing the subject area, it is better to use thesaurus modeling of knowledge. This approach makes it possible to effectively use the thematic thesaurus, which is the basis of a systematic understanding of the content of the concepts of the subject area and its structure, the development of logical, associative and creative thinking, memory and imagination training. In this case, a thesaurus (in the translation from the Greek. - treasure, treasury) is understood as structured and organized knowledge containing the fullest amount of vocabulary on a specific topic, indicating clearly expressed semantic relations between concepts (Andrusenko T.B., 2007 ; Kozlova I.V., 2016, P.P. 38-40). Among the significant number of Knowledge Maps used in practice, we can distinguish the most common types applicable to any business system. They include process-oriented, conceptual, competence maps, social networks, strategic, placement of advanced developments, etc.

3. CONCLUSION

As noted earlier, the report prepared on the results of the knowledge audit, as well as the generated Knowledge Maps, are not the stage of completion of the entire cycle of the audit. Research and practice of implementation of knowledge audit shows that the greatest effect of the implementation of management recommendations developed on the basis of audit is possible only in the implementation of continuous monitoring of the process of their implementation and use. This approach allows timely implementation of the necessary additional studies and adjustments of management decisions made on the basis of audit recommendations. Thus, it should be admitted that the knowledge audit cycle does not end with the preparation and submission of the audit report, but continues throughout the support of management decisions based on its results.

An audit of knowledge accompanies these decisions until they are fully implemented, that is, until the final effect is obtained.

FEATURES OF ATTRACTING FOREIGN DIRECT INVESTMENT TO THE INDUSTRY OF AZERBAIJAN

Lala Hamidova

Azerbaijan State University of Economics, Azerbaijan
lala_hamidova@unec.edu.az

ABSTRACT

According to this article, attracting of foreign investment is a central issue of reconstruction of foreign economic policy and reforming of economic system of the republic. The purpose of this issue is to study the features of attracting foreign direct investment to the industry of Azerbaijan. In the course of the study, the following tasks were settled: investment environment of Azerbaijan was described, investments were analyzed and the direction of foreign investment in the country's economy was determined, and ways to stimulate investment in industry were identified. The research methodology is based on the works of foreign scientists to attract foreign direct investment. The study period covers the period of 1995-2017. The results of the study indicate that the oil sector has been and still remains as the main direction of attracting foreign direct investment in industry. Oil in Azerbaijan is the most attractive area of the national economy for a foreign investor. Due to the fact that the majority of companies engaged in the oil sector are foreign, mostly foreign investments are attracted to this sector. The main direct foreign investors in the economy of Azerbaijan are residents of the UK, USA, Turkey, Japan and Norway. With regard to the signing of international gas agreements, an increase is expected in foreign investment in the energy sector of Azerbaijan. It was revealed that the state investment policy focuses on creating a favorable investment climate in the country, on stimulating the attraction of private capital, as well as finding new forms of joint investment in promising projects.

Keywords: *foreign direct investment, investment environment, oil sector*

1. INTRODUCTION

Attracting foreign direct investment (FDI) is an important issue of reforming the economic system of Azerbaijan. First of all, this is explained by the fact that Azerbaijan needs foreign investments, which are necessary for fundamental changes in the structure of the economy. Another important reason for attracting investment is the fact that every year it becomes more and more difficult to extract and develop rich local natural resources. Thus, in the Azerbaijani sector of the Caspian Sea, with the help of traditional technologies, only 10% of all oil and natural gas can be opened (Trend, 2009, p. 12). This also applies to other deposits of Azerbaijan, especially in the production of iron ores, non-ferrous metals. Azerbaijan has the huge resource potential, which is, certainly, attractive for foreign investors. The territory of Azerbaijan has rich oil and gas fields, polymetals, raw materials for the chemical industry and construction. There is also a sufficient raw material base for the development of processing industries. Besides the rich natural conditions, the foreign investor is also attracted by a highly skilled cheap labor force. Azerbaijan has a favorable geographical position in the Middle East, it is located at the junction of two parts of the world - Europe and Asia. A reliable legal framework secured by the Law of the Republic of Azerbaijan "On the Protection of Foreign Investments" (1992) is also of great importance, according to which foreign investors making investments into the most important sectors of the economy are provided with certain additional benefits. According to the World Bank's Doing Business-2019 report, Azerbaijan ranked 25th out of 190 countries. The best indicator was the Protecting Minority Investors indicator, according to which the country ranked second in the world. Starting a Business Azerbaijan ranks 9th among the countries of the world.

The worst indicators were the construction permit (61st place) and Trading across Borders (84th place) (Doing Business, 2018). According to the Global Competitiveness Index for 2017-2018, Azerbaijan improved its position, rising to 35th place among 137 countries and taking the 1st place among the CIS countries (World Economic Forum, 2017-2018, p. 25). Attracting foreign investment is one of the priorities of the economic policy of the country's leadership. This is not surprising, since Azerbaijan, with a relatively small population, has an impressive economic potential, the realization of which requires investments many times greater than the available domestic investment opportunities. In addition, foreign investment entails not only capital inflows, but also advanced technologies, modern management experience and access to foreign markets, that is, their positive impact on the economy is diversified.

2. REFERENCE REVIEW

World Investment Report (UNCTAD, 2008) defines FDI as “investments directed to long-term relationships and sustainable income and control by a resident of one country (foreign investor) in enterprises of another country”. A similar definition is given by the United Nations: FDI as “investments made to acquire sustainable income or effectively control over an enterprise operating abroad” (Eurostat, 2014, p. 3). In 1966, Vernon developed the Theory of Product Life Cycle to explain the FDI types invested by American companies in Western Europe after World War II. Vernon believed that there were four stages of the production cycle: innovation, growth, maturity and recession. In the first stage, US multinational companies created new innovative products for local consumption and export surplus in order to serve foreign markets (Vernon, 1966). Vernon’s theory was not recognized as a general theory of FDI, as it explained only one reason for investment, and not all aspects of this process. Among all the concepts associated with direct investment, Flying Geese Paradigm by K. Akamatsu is of particular interest. He believed that FDI allowed developing countries and countries with economies in transition to reach the level of developed economies with less time. Therefore, the state was faced with the task of maximally easing restrictions for foreign investors (Akamatsu, 1962). Another theory that attempted to explain FDI is the theory of exchange rates in imperfect capital markets. Itagaki (1981) and Cushman (1985) analyzed currency risks in international trade. Cushman conducted an empirical analysis of currency risks for the first time. He found that an increase in the real exchange rate stimulated FDI made in US dollars, while a rise in foreign exchange lowered the US FDI. Hymer's theory of oligopolistic behavior suggests that the investor is a monopolist in his market. In other words, direct investments are made to curb competition and protect their own interests (Hymer, 1982). Hymer refers to the potential deterrence of domestic producers, which is contrary to the interests of the recipient country of FDI (Dunning & Pitelis, 2008). The theory of internalization explains the growth of transnational companies and their motivation to achieve foreign direct investment. It was developed by Buckley and Casson (1976). According to Buckley and Casson (2009), large firms with an integral internal structure can expand their activities. R. Caves takes into account the FDI direct impact on the recipient country in the form of tax payments, the creation of new industries, the creation of additional jobs. The FDI effect, in his opinion, is reflected in increased competition in the market and the promotion of more technological products among domestic firms (Caves 1974, 1993). The eclectic theory (OLI) developed by Dunning (1979) represents a synthesis of all the existing theories of foreign direct investment. Dunning suggested that the company would benefit from entering the foreign market only if it has the following three advantages:

1. “O” (Ownership advantages) - availability of market entry, ownership of patents and trademarks, international arbitration;
2. “L” (Location advantages) - advantages in transportation costs, production costs, investment incentives;

3. "I" (Internalisation) - effective control of management, ensuring quality control, price discrimination, avoiding violation of property rights (Dunning, 1979, 2000, Janton-Drozdowska & Majewska, 2016).

3. METHODOLOGY

The study used the following methods: a comparative analysis designed to compare the ratio of foreign and domestic investment, investment in the oil and non-oil sector; the method of induction and deduction that allowed to combine individual conclusions on the studied problem and formulate the author's point of view; the method of pair linear regression, with the help of which the dependence of investments on world oil prices was studied. Special methods were also used: absolute and relative statistical indicators, dynamics indicators, factor analysis. The study period covers the years 1995-2017. The information basis for this study consisted of published reports and statistical databases of international organizations UNCTAD, World Bank Group; State Statistical Committee of the Azerbaijan Republic database.

4. INVESTMENTS IN THE ECONOMY OF AZERBAIJAN

In 1995-2017, investments in the economy of Azerbaijan were invested in the amount of 247,3 US dollars (State Statistical Committee, 2018a, p. 405). The main direction of attracting foreign investment in the industry remains the oil industry. Oil in Azerbaijan is the most attractive area of the national economy for a foreign investor.

*Table 1: Investments in the economy of Azerbaijan, mln. dollars
 (State Statistical Committee of the Azerbaijan Republic, 2018a)*

Year	Total investment	Foreign investments	Internal investments	Year	Total investment	Foreign investments	Internal investments
1995	544,1	375,1	169,0	2007	12066,1	6674,3	5391,8
1996	932,1	620,5	311,6	2008	16222,0	6847,4	9374,6
1997	1694,5	1307,3	387,2	2009	13033,5	5468,6	7564,9
1998	1932,2	1472,0	460,2	2010	17591,4	8247,8	9343,6
1999	1571,0	1091,1	479,9	2011	21588,9	8673,9	12915,0
2000	1441,1	927,0	514,4	2012	25777,8	10314,0	15463,8
2001	1561,8	1091,8	470,0	2013	27340,0	10540,9	16799,1
2002	2796,6	2234,9	561,7	2014	27907,5	11697,7	16209,8
2003	4326,3	3371,0	955,3	2015	19547,2	10719,1	8828,1
2004	5922,8	4575,5	1347,3	2016	14228,0	10161,1	4066,9
2005	7118,5	4893,2	2225,3	2017	13851,2	9120,5	4730,7
2006	8300,4	5052,8	3247,6				

As a result of the "Contract of the Century" on the joint development of the Azeri-Chirag-Guneshli oil field as signed in 1994, it became possible to attract foreign investments to the country's economy. According to table 1, over the analyzed period, the growth of investments in the economy of Azerbaijan continued until 2015. The rapid decline in world oil prices in the second half of 2014 and in 2015 led to a sharp decline in oil and gas revenues. Revenues of the State Oil Fund of the Republic of Azerbaijan (SOFAR) decreased 2,1 times in 2015, and 5,4 times in 2016 as compared with 2014 (Oil Fund, 2014, 2015, 2016). Such a rapid decline in oil revenues led to a number of negative processes in the country's economy: the national currency depreciated, foreign exchange reserves declined, the Central Bank's discount rate increased and interest rates on loans, and there was a significant reduction in government spending (Mehtiyev, 2017). The decline in oil revenues also had a negative impact on investments in the economy, especially domestic ones (Figure 1). All this led to a sharp slowdown in economic growth in the country. For the first time since 2000, real GDP growth rates in the country were negative (-3,1%) in 2016, despite the fact that in 2000–2009, annual real growth rates in Azerbaijan were

always about 10 percent or more. After 2010, the growth rate of real GDP in the oil and gas sector also declined due to a decrease in oil production.

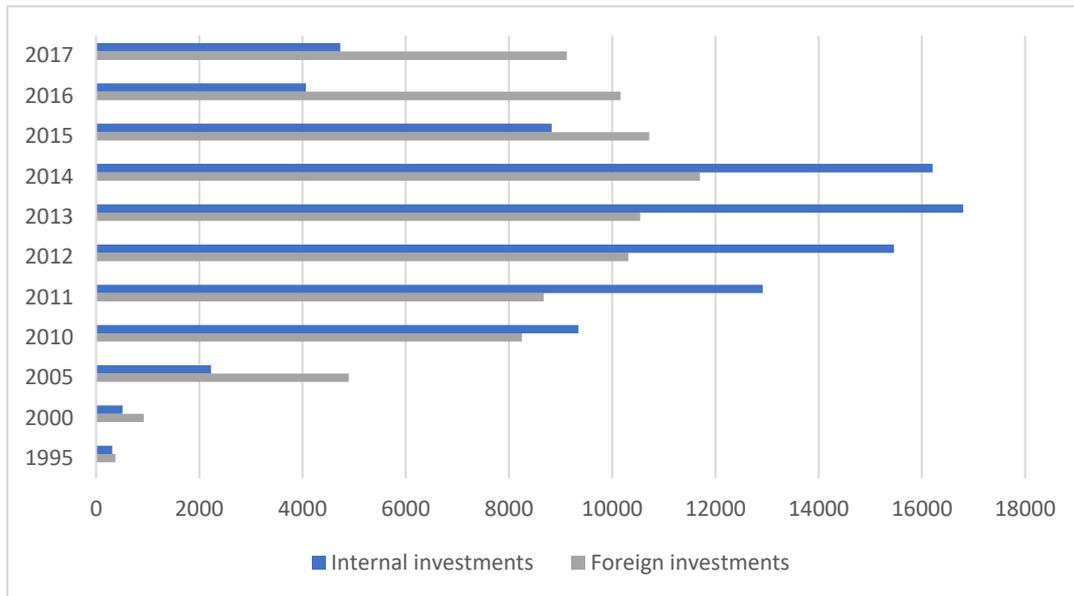

Figure 1: The ratio of foreign and domestic investments in the economy of Azerbaijan, mln. dollars (State Statistical Committee of the Azerbaijan Republic, 2018a)

According to Figure 1, over the period 1995-2017, the volume of investments from all sources of financing increased more than 25 times. Despite the fact that during 2008-2014, the volume of domestic investment outpaced the volume of foreign investment, in subsequent years there was a tendency for the predominance of foreign investment in the country's economy. The main direct foreign investors in the economy of Azerbaijan are residents of the UK, USA, Turkey, Japan and Norway. Their capital is directed to the country's oil sector. The rest of the foreign investment comes from joint ventures and enterprises with foreign capital. In such enterprises (according to 2016), the capitals of Switzerland (\$ 370,5 million), Russia (\$ 363,2 million), Turkey (\$ 307,5 million), Great Britain (\$ 174,4 million), The Netherlands (\$ 127,9 million) are prevailing (State Statistical Committee, 2018b). The structure of foreign investment in the economy of Azerbaijan is shown in Table 2.

Table 2: Foreign investment, mln. dollars
 (State Statistical Committee of the Azerbaijan Republic, 2018a)

	1995	2000	2005	2010	2013	2014	2015	2016	2017
Total foreign investment	375,1	927,0	4893,2	8247,8	10540,9	11697,7	10719,1	10161,1	9120,5
Of which:									
Financial credits	220,4	262,9	698,4	3405,9	2655,8	1880,6	2210,2	2197,8	1783,3
FDI, including:									
oil sector	139,8	546,1	3799,9	2955,3	4935,2	6730,7	6622,7	5617,4	4900,8
non-oil sector	14,9	118,0	230,5	659,6	1041,0	1318,5	860,4	1706,2	813,0
Oil bonus	-	-	1,0	2,0	2,4	17,0	2,0	0,1	1,4
Other investments	-	-	163,4	1225,0	1906,5	1750,9	1023,8	639,6	1622,0

According to Table 2, most foreign investment comes from FDI. In 2000 – 71,6%, in 2005 – 82,4%, in 2015 – 69,8%, in 2017 – 62,6% of all foreign investment are FDI. According to World Investment Report - 2018 (UNCTAD, 2018) FDI in Azerbaijan's economy in 2017 amounted to \$ 2,8 billion. The largest inflow of FDI in 2017 to countries with transitional economies was in Russia, Kazakhstan, Azerbaijan and Ukraine. Among the 18 countries in transition, the top 5 countries that received 81% of all FDI are distinguished: the Russian Federation, Kazakhstan, Azerbaijan, Serbia and Turkmenistan (UNCTAD, 2018, p. 75). As noted in this Report, investments in Azerbaijan in 2017 decreased compared to 2016 by 36%. This was due to the continuing decline in the extraction of natural resources, especially oil. 73% of all FDI is still invested in the oil and gas sector. The ratio of FDI investments in the oil and non-oil sectors is shown in Figure 2.

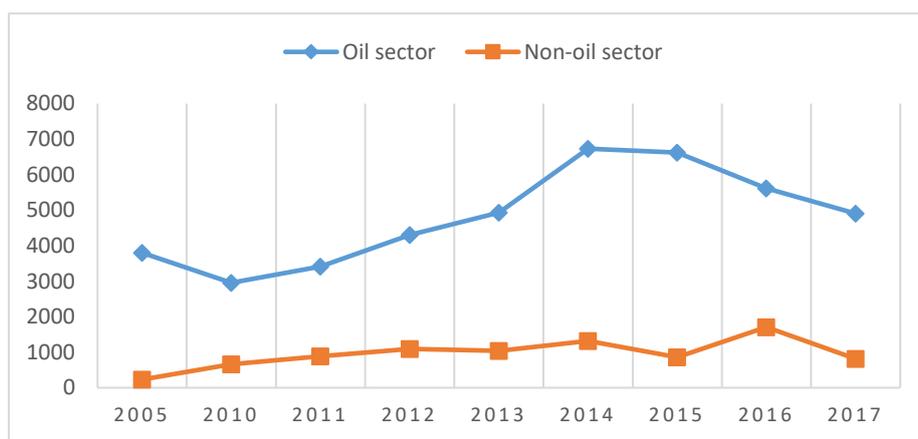

Figure 2: Foreign direct investment in the oil and non-oil sector, mln. dollars (State Statistical Committee of the Azerbaijan Republic, 2018a)

According to Figure 2, the largest share of foreign investment is directed to the oil and gas sector. Nevertheless, one of the main priorities of the government of Azerbaijan is to diversify the country's economy and attract foreign investors. The main directions of development of the non-oil sector are as follows: agriculture, transport, tourism and information and communication technologies.

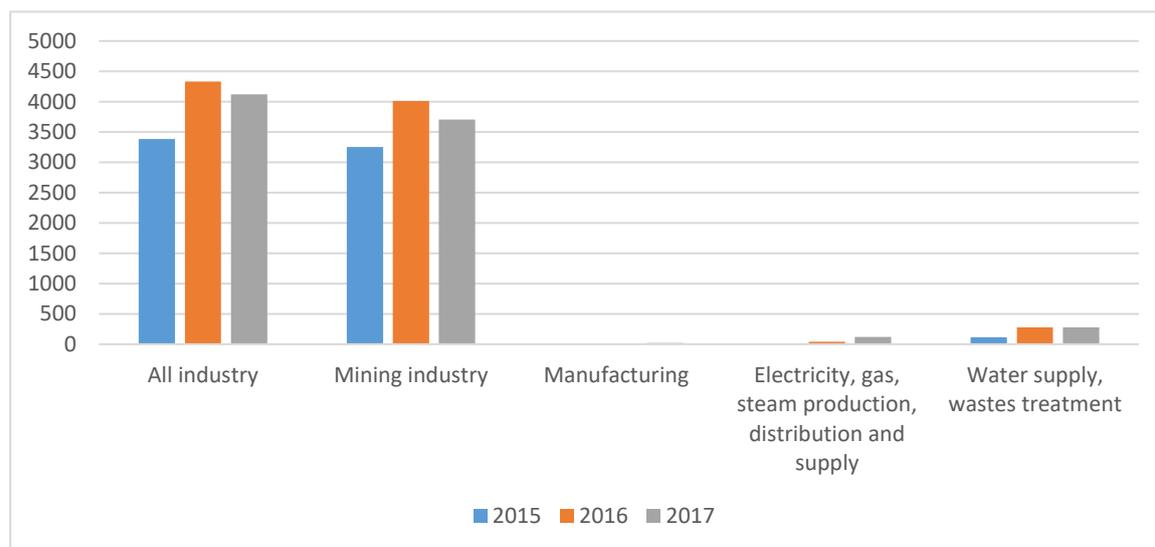

Figure 3: Foreign investment in fixed capital of the industry for 2015-2017, at actual prices, mln. dollars (State Statistical Committee of the Azerbaijan Republic, 2018c)

According to Figure 3, a significant share of foreign investment is in the mining industry. In 2015 – 96,0%, in 2016 – 92,6%, in 2017 – 90,0% of foreign investment in fixed assets of industry is invested in the mining industry. Another interesting fact is that in 2016 there was no foreign investment in Azerbaijan’s processing industry at all. This structure of investment suggests that a foreign investor is attracted mainly by raw materials, especially oil and gas. Let's review the dependence of the volume of investments in the economy of Azerbaijan (y) on the world oil prices (x) by using the paired linear regression method.

Table 3: Linear regression (author’s calculations)

<i>Regression Statistics</i>	
Multiple R	0,919966
R-quadrat	0,846338
Standard R- quadrat	0,83902
Standard error	3687,568
Observations	23

Empiric equation of regression: $y = 252,0736 x - 2895,0739$

To determine the relationship between the signs the Cheddok scale has been used. The linear pair correlation coefficient is determined by the b regression coefficient:

$$r_{x,y} = b \frac{S(x)}{S(y)} = 252,074 \frac{32.805}{8988.804} = 0,92$$

The value of this coefficient indicates that the relationship between the y attribute and the x factor is very high and direct.

Coefficient of elasticity is calculated as follows: $E = 252,074 \frac{54,139}{10751.969} = 1,269$

The coefficient of elasticity is more than 1. Therefore, when x changes by 1%, y changes by more than 1%. In other words - x significantly affects y .

Coefficient of determination is as follows: $R^2 = 0,92^2 = 0,8463$

This ratio shows that in 84,63% of cases, the x changes result in the y changes. In other words - the accuracy of the selection of the regression equation is high. The remaining 15,37% of the y changes are due to factors not taken into account in the model (as well as the specification errors).

Figure following on the next page

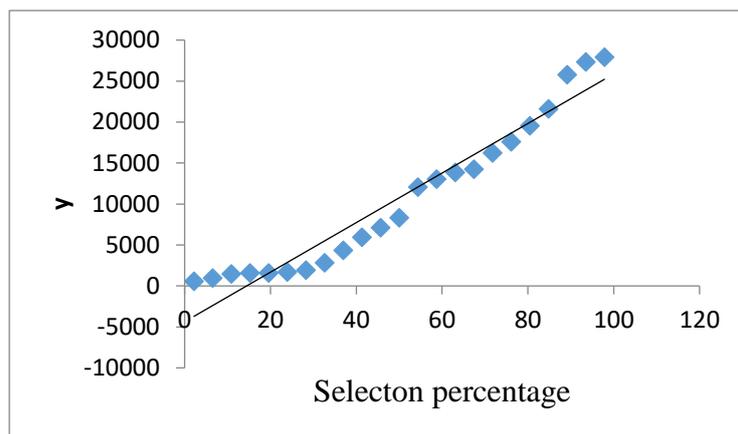

Figure 4: Normal probability graph (author's calculations)

Validation of the regression model is performed by Fisher's F-test. The actual value of the F-test is as follows: $F = \frac{0,8463}{1-0,8463} \frac{23-1-1}{1} = 115,66$

The tabular value of the criterion (F_t) with degrees of freedom is $k_1=1$ and $k_2=21$, $F_t = 4.35$. Since the actual value is $F > F_t$, the coefficient of determination is statistically significant (the estimated estimate of the regression equation is statistically reliable).

5. INVESTMENT ENVIRONMENT IN AZERBAIJAN

The market in the republic provides a great opportunity for those who want to take the risk. But most investors want a 100% guarantee. In addition, the investor can only make direct investments. And the global trend is such that a significant shift in economic policy from providing loans for industrial development to investment by buying shares has occurred. Using the lowest risk strategy, foreign entrepreneurs and their local partners are trying to concentrate their capital in such industries where profits are guaranteed by the product, on the production of consumer goods, on raw materials projects with a relatively short technological cycle, where the turnover is conjugated funds above and their volume of investment is negligible. The most important factor in stimulating investment in the country's economy is legislation. Legislation, as a rule, not only affects the degree of investment risk, but also stimulates investment in certain spheres or industries, determines the procedure for using individual factors of production. To date, the following Laws of the Azerbaijan Republic regulating the activities of investors have been adopted: "Investment activity", "Protection of foreign investments", "Privatization of state property", "Joint-stock companies", "Unfair competition", Tax Code of the Azerbaijan Republic and a number of others. In order to create a favorable investment environment, to facilitate state registration of business entities, the Decree of "On measures to ensure the organization of activities of business entities on the principle of "single window" by the President of the Azerbaijan Republic on October 25, 2007. After the introduction of the "single window" system, the initial procedures for organizing business in Azerbaijan were reduced from 15 to 2, and the time spent on it was reduced from 30 days to 2 days. After the introduction of this system, the number of registered individuals and legal entities increased significantly. The Ministry of Taxes provided the taxpayers with 63 electronic services, and the application of the electronic invoice started from April 1, 2017. The system of online registration of individual entrepreneurs was introduced in 2011, and the registration of local legal entities - in 2012. In order to stimulate investment and to create a favorable business environment, as a result of changes and additions to the Tax Code, the number of tax incentives and exemptions has increased. At present, 129 privileges are provided in the Tax Code of the Republic of Azerbaijan.

To attract and stimulate investment in the republic's economy, industrial parks were established in Sumgayit, Balakhani, Mingechevir, Garadagh and Pirallahi, as well as high-tech parks and industrial districts. For residents of industrial parks, a 7-year exemption from income taxes (income), property tax and land tax is provided. Currently, there are two structures to improve the investment environment: the Azerbaijan Investment Company (AIK) and the Export and Investment Promotion Foundation in Azerbaijan (Azpromo). The purpose of the AIK investment activity is to make investments in the authorized capital of joint-stock companies and other commercial organizations operating in the non-oil sector of the country's economy. Azpromo directs foreign investors to priority sectors for investment and facilitates the procedure of their origin in Azerbaijan. In accordance with the Decree of the President of the Republic of Azerbaijan dated January 18, 2016, the Ministry of Economy issued a document on encouraging investments to legal entities and individual entrepreneurs engaged in investment activities. To stimulate investment promotion, starting from 2016, entrepreneurs who received an Investment Promotion Document for 7 years from the date of receipt of this document are exempt from 50% of income (income) tax, property tax and land tax. Legal entities and individual entrepreneurs importing equipment, technological equipment and installations are exempted from value added tax and customs duties for 7 years from the date of receipt of the Investment Promotion Document on the basis of the relevant supporting document. In addition, today, the Republic of Azerbaijan and 47 countries have executed bilateral agreements on the promotion and mutual protection of investments. All this testifies to the positive steps of the government aimed at stimulating and encouraging investment in the economy of Azerbaijan. To attract investments, it is necessary to create an investment infrastructure that meets international standards. Increase investor interest and the level of investment by the state through the provision of state and commercial guarantees.

6. CONCLUSION

Investments are one of the most important tools for the formation and improvement of the structure of the economy. Transformation of the investment sphere and state policy should play a leading role in the further development of the economy of Azerbaijan. State investment policy should be aimed at creating a favorable investment climate in the country, at stimulating the attraction of private capital, both national and foreign, as well as searching for new forms of joint (private and public) investment in promising projects. An analysis of the dependence of investments in the economy (y) on the world oil prices (x) was performed using a pair-wise linear regression. Its parameters are estimated by the method of least squares. The statistical significance of the equation is verified by the coefficient of determination and the Fisher criterion. It has been established that in the situation under study, 84,63% of the total y variability is explained by the x changes. Economic interpretation of the model parameters is possible - an increase in world oil prices by 1 dollar leads to an increase in investment by an average of 252,074 dollars. This study shows the dependence of investment on the world oil prices. With the rise in the oil prices on the world market, an increase in oil production in Azerbaijan becomes profitable. Taking into account that foreign investments prevail in the total volume of investments (in 2017 their share was 65,8%), it can be said that foreign investments mainly depend on the oil prices. As the oil prices rise, so does the government investment. Revenues from oil exports entering the State Oil Fund of the Republic of Azerbaijan continue to invest in infrastructure, social projects, thereby increasing investments for state projects. As a result of execution of international gas agreements, an increase in foreign investment in the energy sector of Azerbaijan is expected. Despite the growth of foreign investments in the oil and gas industry and the growth of revenues from oil export, it cannot be argued that these investments alone will generate the optimal path for economic development. It all depends on how to dispose of them, in which sectors of the non-oil sector they will be directed.

But the fact that they are called upon to play an irreplaceable role in the economic development of Azerbaijan is indisputable.

ORGANIZATION OF THE EFFECTIVE MECHANISM OF INDIVIDUAL INCOME TAXATION

Leyla Mehdiyeva

*Associate Professor at Azerbaijan State University of Economics (UNEC), Azerbaijan
Department of Finance and Financial Institutions
leyla.mehdiyeva@unec.edu.az*

ABSTRACT

Purpose of the study Investigation of the mechanism of taxation on personal income tax, with the main attention paid to the proportional tax rate, which is the main feature of income tax. Methodology of the study Comparison, synthesis and analysis. Results of the study. The purpose of individual income tax is the replenishment of the country's budget and the even distribution of vitally important funds between the population, which is achieved through the implementation of the functions of the reduced tax. This tax is the economic lever of the state. It is through this that the fiscal and regulatory issues are to be addressed, but this does not correspond to the realities of our time.

Keywords: *Income tax, Proportional Tax Rate, Progressive Scale of Taxation Tax, Tax Rate*

1. INTRODUCTION

The article discusses the economic nature of the income tax as the main type of taxation of income of individuals. The article also studies the foreign practice of collecting income tax. It is noted that the basic principle of the current system of income tax for individuals is social equality, regardless of the origin of taxpayers. The economic nature of the income tax of individuals is characterized by monetary relations between the state and individuals, and, in accordance with the need that had arisen, is formed in order to accumulate funds within the state budget. The economic nature of this type of tax is manifested in its fiscal and regulatory functions. When implementing the fiscal function of the tax, the regulatory effect usually manifests itself in the stages of the business cycle. That is, the change in production volumes and incomes of individuals ultimately provides for changes in tax revenues and government spending.

2. TAXATION POLICY OF PERSONAL INCOME TAX IN MODERN CONDITIONS

In Azerbaijan, as in the most developed countries, the progressive form of taxation is used in terms of personal income. The presence of only two degrees of the tax scale (14% and 25%), the definition of the minimum level, not taxed at the subsistence minimum level for the country and the wide use of tax incentives/concessions, can be presented as characteristic features of this type of tax. The wide distribution of this type of tax in all countries of the world is associated with a number of factors. The main advantage of this tax is that the entire able-bodied population of the country is considered as potential tax-payer. On the other hand, under all-equal conditions, it is easier to carry out the control by the tax authorities and it is very difficult to shy away from his payment. These features of the income tax put on the legislative and executive bodies of the country a huge economic and social responsibility in matters of creating its scale, establishing a non-taxable minimum amount and tax concessions. In the current period of globalization, a flexible tax policy should be pursued as part of a focused economic policy, aimed at even greater improvements of the conjuncture of the market economy. The described tax policy is ultimately aimed at increasing the actual economic potential and increasing the well-being of the population; not only by reducing tax rates and introducing tax benefits, but, also, to a greater extent, by expanding the tax base, stimulating investments in the economy of the country, leveling the tax burden between individuals and individual entrepreneurs, between

resident and non-resident taxpayers, creating a favorable condition for activities of small and medium-sized enterprises, business. In general, the basic principle of the current system of the income tax on individuals is social equality, irrespective of the origin of taxpayers. This means that taxpayers are equal before the law. Taken as the most important principle in creating a tax system, the principle of equality and justice means equal distribution of the tax burden. In other words, this is understood as the fair payment to the state budget of income received in the conditions created by the state for the life and activity of each tax payer. Another important principle of withholding income tax from physical entities is the inadmissibility of paying this tax for a taxpayer. In other words, the tax should be calculated only on the basis of the personal income of a citizen and should be kept from this income. Regardless of the form of ownership and organizational-legal form, enterprises and organizations that pay to individuals do not have the right to pay the income tax at their own expense. The wide distribution of this type of tax in the tax systems of the countries of the world is associated with a number of factors, which is an indication of the special role of the income tax of individuals in the overall tax system. These factors include the following:

- The most important factor is that for this type of tax the taxation subject is real income received by the taxpayer;
- The biggest advantage of this type of tax is that, according to this tax approach, the entire labor force of the country is practically being considered the taxpayer;
- This type of tax is one of the most stable and sustainable budget revenues;
- In terms of productivity, can be considered the most promising. I.e, if you do not take into account other cases, this kind of tax compared to others is easier managed by the tax authorities;
- Even if there are cases of tax evasion, it is quite difficult and in this area the level of tax control is high enough;
- It is for this tax that such important principles of the tax system as universality and uniformity of tax burden realize themselves.

The above mentioned features place an enormous economic and social responsibility on the legislative and executive bodies of each country on the formation of the tax scale, the determination of the non-taxable minimum amount, tax benefits and payment exemption. The fiscal function of the individual income tax, acting as an instrument of the social policy of the state, ensures the accumulation of money at the disposal of the state, and it is, primarily, directed at implementing the functions of regulating the social sphere. But in cases of detecting an injustice in the system of distribution of GDP, the role of the regulatory function of income tax of individuals increases. On the basis of the ideas put forward by many economists, it can be stated that the state should regulate the process of redistributing incomes in society and should carry it out first and foremost with the help of direct taxes. In this case, indirect taxes to a greater extent perform the fiscal function and, under these conditions, the role of the income tax of individuals is even more important (1). Undoubtedly, direct taxes fully comply with the principle of universal taxation and it is precisely as a result of the manipulation of the elements of direct taxes that it is possible to the maximum extent to ensure the regulatory function of taxation. Today, the individual income tax, remaining the only important type of direct tax, is deducted directly from the income of individuals and it is assumed that it is this type of tax that should ensure a fair distribution of income. Summarizing, it can be said that, as a result of this influence, the individual income tax plays a basic role in the conduct of the social policy of the state and the creation of social support for the population in need of social assistance. If it is possible to say so, the amount of income tax paid by physical entities, determines the scale of social services, provided by the state. The higher the share of income tax in the state budget system, the higher will be the level of feedback.

It is for this reason that the value of the income tax for a role in the social policy of the state is very highly appreciated. The specificity of the individual income tax, used by the state as a tool to influence society and the economy, is based on its systemic nature. The income tax consistency implies that all its elements are involved in the process of social regulation and this is perceived as a fair distribution of national income and the creation of funds to finance the social policy of a state (1). The systemic nature of the income tax of individuals manifests itself not only in fiscal and regulatory functions, but also in its orientation to solving social issues. Generally speaking, the regulating function of tax is the ability to influence the stimulation or restraint of production, the accumulation of capital, and the level of solvent of the population. The regulatory function of income tax of physical persons is realized on tax deductions and exemptions from payment, tax benefits, the elements of taxation as the definition of the upper and lower limits of tax rates. The potential of the individual income tax is achieved by creating such a balance among its elements, in which it becomes possible to ensure the accumulation of maximum funds to the state budget and in this way a fair ratio of income among the population after tax was kept. Individual incomes' taxation affects the growth of human capital and the increase in the standard of living. The trend of changes in the level of income of the population manifests itself in the dynamics of the main indicators characterizing economic development. The growth of population incomes increases consumption and accumulation, and this, in turn, increases the standard of living, changes the demographic situation, increases the life expectancy, as well as affects the other processes. If we make a prediction on the taxpayers of the income tax of individuals, then we come to the conclusion that the entire working population of the country can become its potential payer. This means that the number and composition of taxpayers for this type of tax can constantly increase in the ascending line. This, in turn, depends on the level of development of the country's economy and indicators of the social welfare of the population. The interrelation of these indicators is manifested in the fact that the state's vital goal is to ensure the social protection of the country's citizens, which is impossible to achieve without the full development of the economy.

3. FEATURES OF INCOME TAX COLLECTION MECHANISM IN FOREIGN COUNTRIES

In many developed countries, the tax system for individuals acts not only as a channel for the distribution of income, but also, - as one of the macroeconomic instruments, - regulates the ratio of income received between the rich and the poor. The progressive income tax scale allows to catch excess income and to return these funds to turnover (2). The problem of uneven incomes of the population in developed countries has been successfully solved, while in many developing countries and in countries in transition period such problems still remains. The experience of developed countries shows that, within the framework of the market economy, certain leveling can be achieved regarding these incomes, and this can be achieved as a result of the social policy pursued by the state. Now, in the world, there are more than 200 countries. In 15 countries (OAU, Monaco, Kuwait, Qatar, Bahrain, North Korea, etc.) there is no income tax at all. In more than 150 countries, a progressive tax scale is applied. The progressive scale of taxation allows not only to increase the incomes of the state treasury, but also to regulate the level of social stratification that exists in all countries. The progressive scale of taxation existing in many countries is usually multi-stage. It means that the income is divided into parts on a scale and the rate for each part is determined. In some countries, income is divided into many parts, and therefore the transition from one group to another occurs gradually. In other countries, the progression is accompanied by a spasmodic (leap) character (2).

4. THE PROBLEMS OF BALANCING ECONOMIC AND SOCIAL INTERESTS IN THE COLLECTION OF INCOME TAX

The comprehensive nature of tax reforms implies not only a transition to a new mechanism for calculating tax, but also introducing changes to the practice of tax administration, and especially tax control. In accordance with the needs of taxpayers in the social sphere, tax deduction should be improved. It is also necessary to increase the social expenditures of the state for successful reform. High tax rates can only be effective if the tax payments are justified in terms of the volume and direction of government spending, and, at the same time, tax control easily provides taxpayer motivation with tax payments. Determining the minimum taxable amount plays an important role in implementing the principle of equity with regard to income tax. In many developed countries, along with social tax amnesties, the minimum amount not subject to tax is an important indicator and constitutes a fairly large amount. While solving the problem of social justice, an important issue is the correct and reasonable definition of the subsistence minimum. This indicator determines the standard of living of the society, especially the low-income group. The problem of balancing economic and social interests is one of the issues that is constantly in the center of attention of any state and has become the cause of constant controversy and debates. The solution of this issue is in the formation of an effective mechanism of taxation and the use of different methods and mechanisms to achieve this goal. The goal of the state tax policy is to ensure a balance of economic and social interests and to achieve economic development with it, to constantly stimulate this development and, at the same time, to achieve social justice, using the most effective methods to achieve overall development. The increase in the share of income tax in general tax revenues should not occur through an increase in tax rates. This should primarily be carried out by expanding the tax base. The increase in the number of registered taxpayers, the precise indication of income from taxpayers and the improvement of tax legislation for these purposes are factors affecting the growth of the tax base. Favorable economic and social protective incentives should be created for the interest of every taxpayer, while accurately indicating the actual tax base. Every taxpayer should realize the importance of accurate and timely payment of taxes and be interested in the implementation of this process in accordance with the law (4). Revision of the basis for determining the minimum amount not subject to tax on personal income tax and calculation of this indicator for the average monthly wage or other indicator, issues are the focus of attention. In the current situation, compliance of the size of non-taxable minimum amount with the established annual subsistence minimum does not fully ensure the social interests of society. Also, it should be noted that the non-taxable minimal amount in the tax system of many developed countries is large enough and is one of the important factors in the implementation of social policies for these countries. The indicator of the minimum of non-taxable amount acts as an important tool in the implementation of the social policy of the state, and the correct use of this lever can be considered an important factor. In the modern tax system in the principles of taxation on the income tax of individuals one of the main places is tax concessions and amnesties. The number and rates of these benefits are primarily related to the social policy of the state. Under the current legislation, they serve the interests of a group of people that are more in need of social protection. But, it is necessary to collect statistical data in this area in a timely manner, analyze it on the basis of this data, and if necessary, make changes to the composition of tax benefits that can be applied. It is necessary to maintain social balance and control over it. In general, as in any field, in the area of taxation of personal income it is very important to study international experience. In modern conditions, the main goal facing the tax system is development in accordance with international standards and the formation of a level that meets modern requirements. Of course, it is needed to take advantage of the experience of developed countries and investigate the possibility of using this experience.

5. CONCLUSION

Improving the taxation of individuals requires, in the future, the study of assessing the tax burden for the population, considering the individual solvency of each citizen as the basic principle of creating the state's tax system. Obviously that the payment capacity of the population should be the main criterion in calculating the tax burden. In almost all societies, the difficulty of determining a more optimal tax rate is complicated by the likelihood of the above situations. Thus, in the conditions of increasing the upper limit of the tax rate of individuals, the problems of closing the channels of evasion from paying this type of tax to the high-income part of the population are even more acute. As one of the effective ways to solve this problem, the following can be noted: in addition to recording incomes of individuals, strict measures of control over the compliance between the income of this individual and his actual expenses should be implemented. In general, the reforms carried out regarding the income tax of individuals in the tax system should be planned in advance, information collected and analyzes carried out carefully. At the same time, the possibilities of studying the practice of developed countries and its application in the economic system of our country should be investigated. The study of international practice in tax management and the use of this experience are necessary for taking new steps in the development of the tax system and its development in accordance with the international standards.

SOME ASPECTS OF OUTSOURCING AS A FACTOR OF EFFECTIVE DEVELOPMENT OF THE ORGANIZATION

Leyla Mamedova

Azerbaijan State Economic University (UNEC)

Azerbaijan, Baku

leyla-m-4@inbox.ru

ABSTRACT

In modern conditions, organizations are increasingly turning to outsourcing services as one of the ways to effectively develop an organization. The article presents various approaches to the definition of the term outsourcing, identifies the reasons for switching to outsourcing, and assesses the advantages and disadvantages of this approach. The efficiency of using outsourcing in organizations was evaluated.

Keywords: *development, effective development, organization, outsourcing, types of outsourcing*

1. INTRODUCTION

At present, in the context of globalization of production and business activities, companies operate in a highly competitive environment. One of the ways to allow business entities to achieve high-quality results of their activities is outsourcing. Today, the concept of outsourcing is quite actively discussed both in the scientific literature and in business circles and the media. Organizations evaluate business process outsourcing as one of the factors that make up the competition. The purpose of this work is the study of outsourcing as a factor in the development of the economy and the possibility of its use in the activities of companies. The relevance of the work is determined by the fact that in modern conditions it is impossible to imagine the development of the world economy without the use of outsourcing, with the help of which enterprises significantly increase their competitiveness by reducing costs and rationalizing production and management activities.

2. THEORETICAL APPROACHES AND LITERATURE REVIEW

In the outsourcing management model, some functions that were previously the prerogative of the company's internal divisions (accounting, legal services, marketing research, maintenance of the internal information network, processing incoming information, public relations, and many others) are transferred to other - highly specialized - service organizations. Table 1 shows the main approaches to the interpretation of the concept of "outsourcing".

Table following on the next page

Table 1: The main approaches to the interpretation of the concept of "outsourcing"

The interpretation of the concept of "outsourcing"	Author, year of publication
Acquisition of goods or services from sources external to the organization	W.M. Lankford, F. Parsa, 1999
Transfer of an internal division or divisions of an enterprise and all its related assets to a service provider organization offering to provide a certain service for a specified time at a specified price	JB Heywood, 2003
Exclusively placing an order for the performance of work by a third party under the contract	E. Anderson., B. Trinkl, 2006
Using and attracting third-party resources, assets and skills based on a contract with a guaranteed level of quality, sustainability and value for value criteria and measurements previously performed in-house, possibly involving the transfer of existing personnel to a service provider and / or transformation / rejuvenation of business support for processes and technology	J.-L. Bravar, R. Morgan, 2007
Strategic management model in which business processes of one participant (customer) are transferred for execution to another (outsourcer)	S.N. Zhivaykin, 2011
One of the elements of the strategy of economic growth due to external factors	E.S. Shlenskova, 2011

The review of approaches to the definition of the essence of the concept of outsourcing leads to the following conclusion: the whole point of outsourcing is that it is necessary to concentrate all resources on the type of activity that is essential for the organization, and transfer support and accompanying reliable and professional partner.

2.1. Motives for using outsourcing

Heads of enterprises need to allocate one or more targets for the use of outsourcing, based on the proposed options or introducing additional goals, and only then create one or another mechanism for its implementation. The key goal, of course, should be the concentration of business on the activities that provide the core competencies of the company. The significance of the remaining goals depends on the specific situation. The main motive for outsourcing lies in the desire of open companies to formally improve their economic performance. And in order to get a successful experience of outsourcing, it is necessary to clearly understand the benefits and the need for such a step, psychological and material readiness for additional expenses that will necessarily be in the transfer of the business process to the side. Figure 1 shows the most typical motives for using outsourcing.

Figure following on the next page

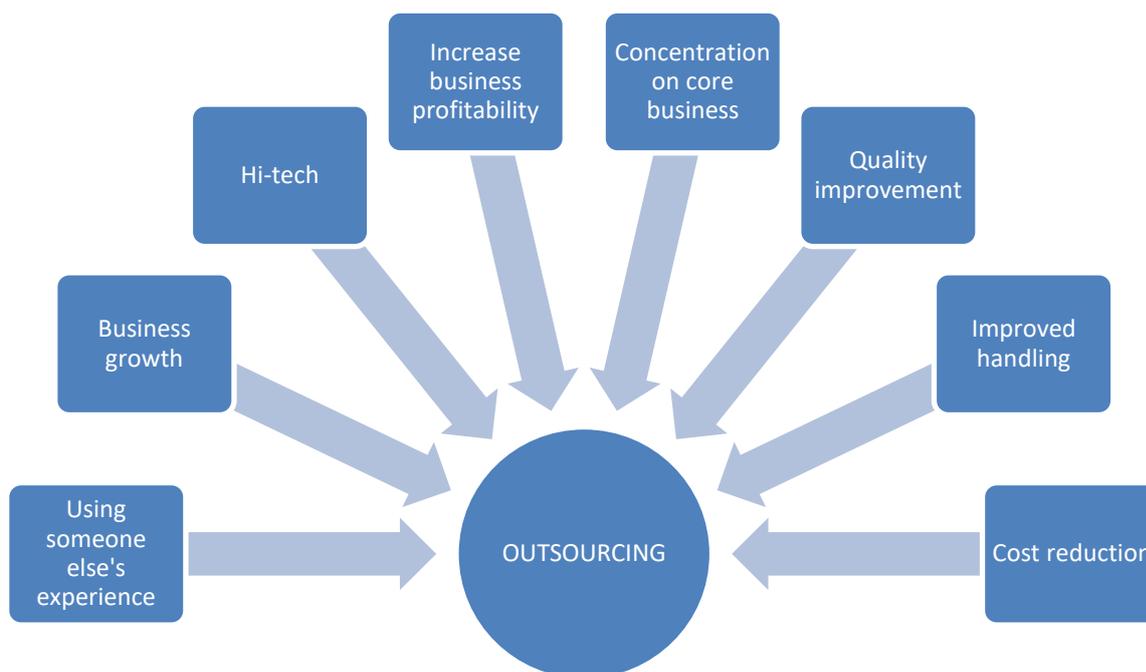

Figure 1: The main reasons for using outsourcing

In my opinion, the main distinguishing features of outsourcing from other types of cooperation are:

- the ratio of customer needs and outsourcer specialization: in some cases, the outsourcer must be the best performer of the necessary functions for the customer in the market;
- relations are limited to the volume of the performed function, which allows reducing the risk of loss of confidentiality of information, which is characteristic of other types of relations.

Before making any decision, it is necessary to analyze the positive aspects and disadvantages of outsourcing. The advantages and disadvantages of using outsourcing are summarized in Table 2.

Table 2: Advantages and disadvantages of outsourcing

No	Positive sides	Disadvantages
1	effectively use new technologies	threat of leakage of significant information
2	improve handling	danger of losing jobs
3	reduce the cost of implementing business processes, reduce costs and control them	transfer of an excess of significant functions
4	free up internal resources	the threat of separation of top management from direct impact on business processes
5	improve the quality of the products or services received	in some circumstances, an outsourcing is detrimental and more expensive than anticipated
6	focus on the main activity	Lack of a developed legislative base for outsourcing in Azerbaijan

In general, outsourcing is very profitable and convenient, and in some cases it is simply necessary, because it allows you to avoid a lot of risks, and also simplifies the work and allows you to improve not only certain functions, but also the activities of the company as a whole.

3. CLASSIFICATION OF OUTSOURCING TYPES IN MODERN ECONOMY

It should be noted that today the classification of outsourcing services is not well established and final, since partnerships within specific outsourcing agreements may have significant differences. The reason for this was the rapid pace of development of this business sector, the emergence of new forms of relationships in the context of economic globalization, legislative restrictions, etc.

3.1. Management and economic aspects of outsourcing

In outsourcing, we can distinguish both managerial and economic components (see Table 3).

Table 3: Managerial and economic aspects of outsourcing

The essence of outsourcing	Refusal to independently perform certain functions in order to increase the efficiency of the enterprise
Managerial aspect	Transferring tasks or processes for execution to external operators
Economic aspect	Using external resources to perform the functions of an enterprise, i.e. attraction by the company to conduct its business activities of factors of production controlled and organized by other firms in the interests of the client company

From a management point of view, it is convenient to classify types of outsourcing by the criterion of the types of processes transferred to execution by an outside contractor.

3.2. Approaches to the classification of outsourcing

There are four main approaches to such a classification (see table 4). As can be seen from table 4, the natural classification of outsourcing from an economic point of view should be carried out according to the criterion of the type of resources (production factors) necessary to perform the relevant functions.

Table 4: The most common approaches to the classification of outsourcing

Classification feature	Types of outsourcing
Attitude to the core activities of the enterprise	Outsourcing core processes Auxiliary process outsourcing
Activities	Production outsourcing Production and economic outsourcing IT outsourcing Logistics outsourcing Knowledge Management Outsourcing Staff outsourcing Accounting outsourcing
Transferred functions	Full outsourcing Partial outsourcing Intermediate Outsourcing Joint outsourcing Advanced Outsourcing
Resource type (factors of production)	Capital Outsourcing Labor outsourcing Outsourcing Information Outsourcing entrepreneurial abilities Mixed outsourcing

In this case, the following types of outsourcing can be distinguished:

1. capital outsourcing. This type of outsourcing includes:
 - production outsourcing (the company places orders for the manufacture of a product under its brand with a third-party contractor);
 - leasing (here for the production of products used equipment that belongs to another organization);
2. labor outsourcing (staff outsourcing);
3. information outsourcing - in this case, the client company entrusts the collection and processing of information, and in some cases, the development of a solution on its basis to a third-party enterprise. This type of outsourcing refers, in the opinion of ID Kotlyarov, to accounting;
4. outsourcing of entrepreneurial abilities is the process by which the contracting authority uses entrepreneurial abilities concentrated in other companies to conduct its own business activities. It is mainly about outsourcing intellectual capital, which is the fruit of entrepreneurial skills. This type of outsourcing includes franchising and licensing. These activities traditionally do not apply to outsourcing, but despite this, they are considered precisely as some particular cases of outsourcing. For example, when franchising, an independent entrepreneur (franchisee) outsources the management of the brand under which he conducts his business activities;
5. mixed outsourcing is a process in which the contracting authority transfers to a third-party contractor a function that requires the use of several types of resources. This type of outsourcing includes factoring, in which the enterprise factor, on the one hand, provides the supplier with financial resources (capital outsourcing), and on the other hand, collects and processes information about the current and potential customers of the supplier to determine their solvency (information outsourcing).

Depending on the classification of the transferred processes according to the criterion of their relationship to the core activities of the company for the main and auxiliary processes, they distinguish the outsourcing of the auxiliary processes and the outsourcing of the main processes:

- the outsourcing of core business processes is the transfer to the side of the processes directly related to the main activity of the company. Often this type is called production outsourcing, because outsourcing transfers part of the existing chain of production processes or the entire production cycle to an outsourcer;
- the outsourcing of auxiliary business processes is the transfer of a specialized company of processes that are aimed at supporting the main processes, accompany them and form the infrastructure of the company. For example, the transfer of the processes of procurement, logistics.

Depending on the volume of transferred functions for outsourcing, the following types of outsourcing are distinguished:

- full outsourcing - assumes that the company-customer transfers in full to the company-executor a separate production or business process;
- partial outsourcing - is the transfer of the individual functions of a department to the company-executor. Today, this form of outsourcing is the most relevant and popular in the global and domestic economy;
- joint outsourcing is carried out in the case when the parties to the outsourcing agreement are partners;
- intermediate outsourcing - assumes that the company for some time transfers the management of its units (in which, as a rule, highly qualified specialists work) to a third party;

- improved outsourcing - when the contracting authority transfers to the executing organization the functions that it does not want to carry out in its own structure. But at the same time the customer reserves the role of a distribution management body.

Another sign of the classification of activities, which include the transferred processes. Often with this approach, the following types of outsourcing are distinguished:

- outsourcing in the field of information technology (IT - outsourcing) is a partial or complete transfer of work on the support, maintenance and modernization of the IT infrastructure of a company specializing in subscriber services for organizations and having a staff of specialists of various qualifications. For them, the performance of such work is a core activity. As a rule, during IT outsourcing, the client company transfers its functions in servicing client information systems, such as technical support, system administration, development, implementation and maintenance of software in enterprises, development and maintenance of websites, equipment maintenance, etc. .
- production outsourcing - when it is more profitable for the enterprise not to carry out the production process on its own, but to transfer them in full, or in part, to an outside organization. The use of this type of outsourcing, in the first place, allows the organization to focus on developing new service products, as well as to increase the flexibility of the production process and diversify the products to the current market demand;
- production and economic outsourcing - is the most common type of outsourcing. All work organization of corporate catering, cleaning of the premises and the surrounding area, the management of vehicles of the enterprise, operation of real estate, etc. are transferred to the outsourcing companies;
- logistics outsourcing is the acquisition of logistics services from a third party. The essence of this type is to reduce the cost of the company in the implementation of the supply chain of goods through the involvement of a competent professional in the business processes - the logistics operator;
- personnel outsourcing (personnel outsourcing or staff leasing) is the transfer of companies of all organizational issues related to personnel business to a contracting firm specializing in recruiting and hiring staff on a temporary and permanent basis;
- accounting outsourcing is a special case of business process outsourcing, one of the methods of accounting support of the company. This type of outsourcing involves the transfer to the outsourcer functions related to the organization, accounting and reporting;
- knowledge management outsourcing is the transfer of management of processes that require in-depth study and analysis, time-consuming and energy-efficient processing of large amounts of data, the formation and management of knowledge bases, which can be used in the future to make strategic decisions.

3.2.1. Evaluation of the effectiveness of outsourcing

It should be noted that it is not necessary to understand by outsourcing the use of absolutely any services provided by external performers. By outsourcing, it is necessary to understand precisely the transfer for a long time, the maintenance of any non-core activity of an organization that is able, in principle, to cope with this implementation and itself through its own forces without outside help. Considering the many types and forms of outsourcing, it should be noted that when choosing a company - an outsourcer should be considered:

- experience in the market of services provided (non-standard situations faced by the company's specialists);
- within what time frame the company undertakes to correct the mistakes made;
- the presence of complaints from the serviced customers;

- how the company insures the risks of poor-quality service provision;
- for which services under the contract the company bears financial responsibility;
- and, finally, the absence (presence) of lawsuits.

It seems that it is necessary to make an assessment of the effectiveness and feasibility of outsourcing, in order to avoid many mistakes in its use, and the assessment must be made at the planning stage, i.e. before the conclusion of the outsourcing contract. After the introduction of outsourcing into a business, you can monitor and monitor the company's work, changes, successes and failures, to draw conclusions, and further to avoid mistakes made and to correct shortcomings, to eliminate weaknesses.

4. CONCLUSION

Based on the study, the following conclusions and suggestions can be made:

1. Outsourcing is a management strategy that allows you to optimize the functioning of the company by focusing on the main direction. Despite the fact that many domestic companies today are only looking at this type of service, small and medium-sized businesses are already actively using the services of outsourcers in terms of information technology, financial (accounting) and personnel outsourcing.
2. Even a small analysis of outsourcing leads to the conclusion that this type of service is beneficial for the organization. And even despite the presence of limitations and shortcomings, outsourcing allows the company to get rid of many routine operations. Consequently, a company can simultaneously save money, improve the quality of its reporting, free up internal resources for its core business, afford to engage in processes that generate profits, pay more attention to their future, study new technologies, direct their development efforts, thereby increasing their competitiveness in the market.

ABSTRACT

In modern age, one of the main goals of each state is to ensure the country's sustainable economic development and the welfare of people. The income from natural resources has a unique impact on sustainable economic development. Azerbaijan implements large-scale projects for the efficient use of natural resources. It should be noted that Azerbaijan's natural gas reserves are considered as new opportunities for Europe. The choice of a natural gas transport route to Europe has become a necessity for this opportunity to materialize. Therefore, for the export of Azerbaijani gas to Turkey and Europe it is particularly important in the creation of the Southern Gas Corridor. The Southern Gas Corridor consists of the South Caucasus pipeline, the Trans-Anatolian Natural Gas Pipeline and the Trans-Adriatic Pipeline. This project emerged as a strategic partnership between Azerbaijan and Turkey, also have political and economic importance for both countries. The main aim here is exporting Shah Deniz II gas to Europe via the territory of Turkey and ensure Europe's energy security. TAP and TANAP projects help to integrate Azerbaijan with regional and European energy markets, and to strengthen the transit and transition role of Caucasus. In this article, two major projects - TAP and TANAP, which are still under development, were examined and these projects' future contributions to Azerbaijan and Europe's energy security were shown. Furthermore, the effectiveness of these global projects for the parties and their place in energy policies were evaluated.

Keywords: *Efficiency, Energy, Resource, TANAP, TAP*

1. INTRODUCTION TO TAP AND TANAP PROJECTS

Azerbaijan has been famous for its oil production and export since ancient times. However, in the last 10 years, the country has been developing the natural gas sector rapidly. The estimated gas reserve of the Republic of Azerbaijan is approximately 3 trillion 450 billion cubic meters. It should be noted that the GDP growth rate in Azerbaijan was 0.1% in 2017, and this figure has been average 16% in 2002-2010. Despite the decline in oil revenues, the increase in gas production indicates that this would be compensated. In addition, the Government of Azerbaijan for managing the income derived from energy resources and transferring these revenues to future generations established SOFAZ (State Oil Fund of the Republic of Azerbaijan) in 1999 and this fund has been conducting various local and international projects to ensure the economic development of the country. In general, the leading role of the energy sector in the country's economy cannot be denied and we will see a sharp increase in the share of the gas sector in this role in the coming years. The pace of development of the country's gas strategy has contributed to the implementation of a number of major projects. South Caucasus Pipeline, Trans-Anatolia and Trans-Adriatic Gas Pipelines, which are part of the Southern Gas Corridor project, became an integral part of Azerbaijan's gas strategy. The main purpose of these projects is to provide Shah Deniz-2 gas export. Therefore, the State of Azerbaijan carries out various activities for the full scale development of this area. It should be noted that 67.8 billion cubic meters of natural gas and 17.6 million tonnes of condensate have emerged from

the Shah Deniz field during the period 2006-2015. In 2015, 9.9 billion cubic meters of gas and 2.3 million tonnes of condensate were obtained from this area. In addition to 9 billion cubic meters of gas from Phase 1, 25 billion cubic meters of gas are expected to be produced. From 2006 to 2017, 85 billion cubic meters of gas and 21.2 million tons of condensate were removed from the Shah Sea area. The TANAP project is an integral part of the Southern Gas Corridor. The TANAP project will ensure the sale of 6 billion cubic meters of 16 billion cubic meters of gas annually to Turkey and 10 billion cubic meters to Europe, which will be produced in the second phase of the development of the Shah Deniz field. As a further support for the TANAP project, according to the relevant decision of the Cabinet of Ministers of Turkey, companies that are involved in the construction and supply works in the TANAP project since the beginning of 2015 are exempt from VAT. The main shareholders of the project are SGC (Azerbaijan) - 58%, BOTAS (Turkey) - 30%, and BP (Great Britain) - 12%. The length of the pipeline is 1802 km, the initial transmission capacity is 16 billion cubic meters per annum (with a capacity of up to 31 billion cubic meters). The date of commissioning of the initial phase of the project is 2018. The TAP project as a continuation of the South Caucasus Pipeline and the Trans-Anatolian Pipeline (TANAP), envisages the transportation natural gas from Shah Deniz-2 through the territory of Greece and Albania to the south of Italy. It is planned to deliver Azerbaijani gas to Europe via this pipeline in 2020. Shareholders of the project: BP (Great Britain) -20%; SGC (Azerbaijan) - 20%; "SNAM S.p.A" (Italy) - 20%; Fluxys (Belgium) - 19%; "Enagas" (Spain) - 16%; Axpo (Switzerland) - 5%. The length of the pipeline is 878 km and the initial transmission capacity is 10 billion cubic meters per annum (with an extension of up to 20 billion cubic meters).

2. EFFICIENCY OF TAP AND TANAP PROJECTS

The South Caucasus Pipeline, which transports Azerbaijani natural gas to the Georgian-Turkish border, The Trans-Adriatic Pipeline, which will transport natural gas to Greece via TANAP, Trans-Adriatic Pipeline, which will transport natural gas to Italy are the main segments of the Southern Gas Corridor. Through the SCP, TANAP and TAP pipelines, the gas produced from the Shah Deniz-2 field in the Azerbaijani sector of the Caspian Sea will reach Turkey and Europe to Europe. The Southern Gas Corridor, with a length of 3,500 km, is expected to transport 6 billion cubic meters of gas to Turkey and 10 billion cubic meters of natural gas to Europe. Export to Turkey and Europe will play a significant role in the energy security of Europe and Turkey, and will create enormous opportunities for the Azerbaijani economy.

2.1. TANAP project effectiveness

Relations between Turkey and Azerbaijan are based on deep historical roots. The existing socio-economic relations between the two countries, the energy potential of Azerbaijan and Turkey's geo-strategic position create important opportunities for both countries. TANAP is a great opportunity for both Turkey and Azerbaijan. Implementation of the project for Azerbaijan is an opportunity to transport its natural gas to international markets without Russia. For Turkey it will be a chance to reduce dependence on existing gas suppliers. Russia is close to 60 percent of Turkey's imports. So, the first effect of TANAP begins here. An annual 6 billion cubic meters of Azerbaijani gas through TANAP will generate 12 percent of Turkey's total imports. Thus, the share of Russian gas will drop below 50. In addition, the implementation of such large-scale projects will further strengthen ties between Azerbaijan and Turkey, bringing together the two countries and their peoples. TANAP project is an economically important project and not only an increase in the economic potential of Azerbaijan, but also for Turkey's and Europe's gas security, as well as for transit countries - economies of Turkey and Georgia. Since these countries are transit countries, they will benefit from this operation. The TANAP project also boosts its role as the regional energy center of Azerbaijan and helps reduce Turkey's traditional

dependence on Russian and Iranian energy. In the future, with the TANAP and TAP projects, Turkmenistan, Iran, Iraq can increase gas production and export gas to Turkey and Europe. Using these projects, these countries will also help to diversify gas exports in Europe and Turkey. In the future, the Trans-Caspian pipeline will also be able to export some of the Asian gas to Europe and Turkey through those pipelines.

2.2. TAP project effectiveness

Starting in 2016, this pipeline will be completed in 2020. TAP project, which has a total length of 879 km, crosses Greece (545 km), Albania (215 km) and the Adriatic Sea (105 km), reaching the southern coast of Italy. It will then be 55 km to Italy and will connect to the Italian general gas grid. In general, the idea of bringing Azerbaijan's natural gas resources to the world market has been discussed since 2003. First, NABUCCO project was developed. However, this project was not found to be so efficient. Therefore, a new project with the Southern Gas Corridor project was prepared. As part of this project, TAP serves the delivery of Azerbaijani gas to southern Europe. Local authorities in Albania, Greece and Italy raise their objections against construction of TAP because of its social and environmental hazards. For example, in the Albanian section of the project, the olive groves, gardens and grazing areas of the local people are located in the area where this pipeline passes. The same concern is also seen in Greece, because the pipeline passes through the northeastern territory of the country suitable for agriculture. Moreover, the TAP pipeline will affect the tourism sector of southern Italy. All these problems endanger the project's sustainability. In the beginning 10 billion cubic meters of gas from the TAP pipeline will be transported. This will be enough to supply about 7 million families in Europe. The project is expected to connect two additional compressor stations and not only the Shah Deniz 2, but also the natural gas reserves of the Caspian region can be involved in the project. In this case, it will be possible to double the power supply. Moreover, There are other sources beyond the Azerbaijani coast in the region. It is possible to import gas from Turkmenistan. Also, gas supplies from the Eastern Mediterranean region and the Kurdish region in Iraq can also be transported through the pipeline in the future. TAP project left behind major projects such as NABUCCO, ITGI (Turkey-Greece-Italy) and SEEP (Southeast European Pipeline) and selected among them for its economic efficiency. Particularly, it has exceeded the main rival project- NABUCCO. Firstly, the length of NABUCCO reaches 1300 km in Europe, whereas the length of TAP is 870 km. Also, 2.2\$ billion needed for initial implementation of TAP, while the same figure reaches 7.9\$ billion in NABUCCO. This means that less time and money are required for the implementation of the TAP project. According to the information provided in 2018, 82% of the Trans-Adriatic pipeline's engineering, procurement and construction works have been implemented. 98% of territory Greece and Albania where the pipeline passes was totally cleared and appreciated. In each of the two countries, about 90% of the pipes have been docked.

2.2.1. Natural gas demand and production in Europe

The graph below shows the demand for gas in different European countries, with an increase every year. Additionally, according to Oxford University Energy Institute, there will be an additional 88 billion cubic meters of gas demand in 2013-2030. During the three years mentioned, Turkey has grown by about 6 billion cubic meters and about 50 billion cubic meters in Europe.

Figure following on the next page

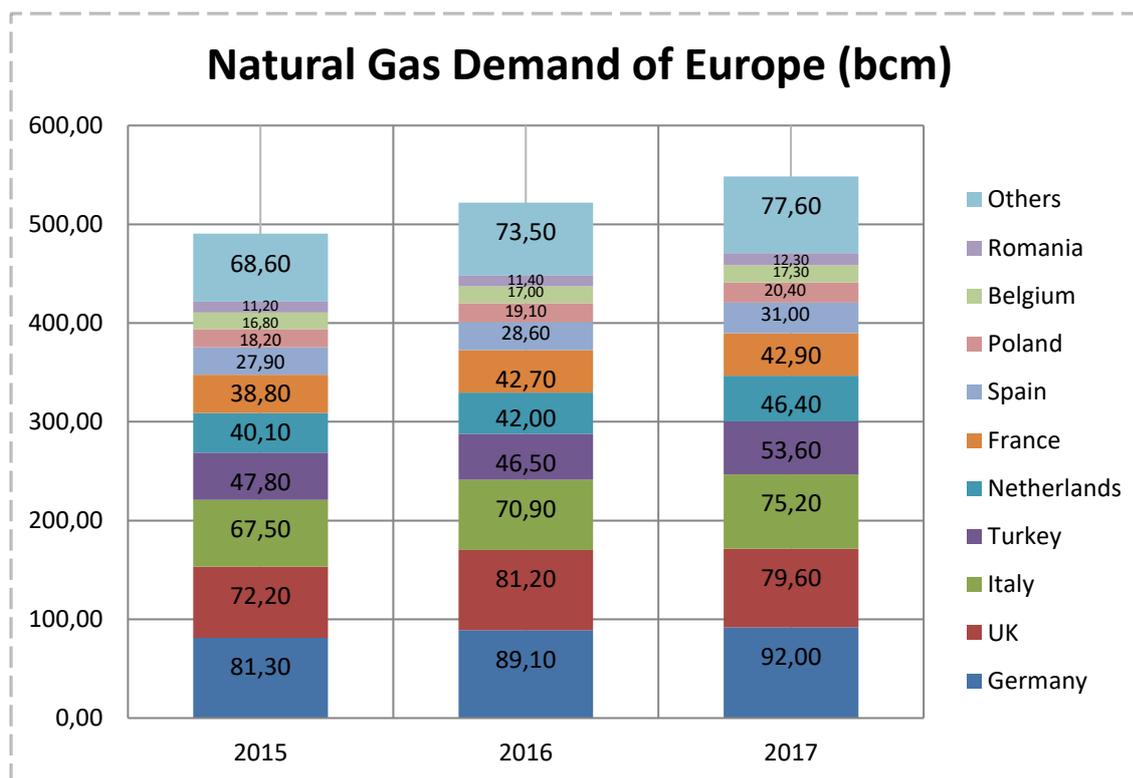

Figure 1: Natural Gas Demand of Europe (The Oxford Institute For Energy Studies 2018)

Europe's gas production began to decline about 10 years ago and currently the EU imports more than three-quarters of the gas supply. Decline in European production will continue. The International Energy Agency (IEA) predicts a decrease of approximately 100 billion cubic meters (about 80 billion cubic meters in the EU) by 2040. It is known that Europe will rely on imports.

2.2.2. Change in demand for oil and natural gas around the world

According to the International Energy Agency, the demand for natural gas will increase from 20.9% in 2010 to 22.4% by 2035. (among the types of energy: oil, coal, gas, biomass, nuclear, hydro). Nevertheless, the demand for oil will reduce from 32.9% (year-end 2010) to 27.8% (up to 2035). Therefore, increasing Azerbaijan's gas exports will reduce the decline in oil revenues to the real sector and the GDP. Based on the information provided above, we can say that Azerbaijan will be able to increase gas exports in future with TANAP and TAP projects. Replacing oil revenues with gas revenues will have a positive impact on trade balance and economic activity.

3. RELATIONSHIP BETWEEN GDP AND GAS EXPORTS

The signing of the Century's Contract and the increase in oil exports in Azerbaijan have had a major impact on economic growth, which increase in gas export will play an important role in the development of the economy. To evaluate this, we build a regression analysis of the following patterns: GDP and gas exports value.

Table following on the next page

Years	GDP	Azerbaijan Natural Gas Export Value (AZN)
2006	18 760 888 090,44 AZN	2 842 075,67 AZN
2007	28 360 500 000,00 AZN	15 517 451,31 AZN
2008	40 137 200 000,00 AZN	59 763 014,30 AZN
2009	35 601 500 000,00 AZN	100 796 404,17 AZN
2010	42 465 000 000,00 AZN	231 875 083,44 AZN
2011	52 082 000 000,00 AZN	452 114 654,04 AZN
2012	54 743 700 000,00 AZN	509 632 232,32 AZN
2013	58 182 000 000,00 AZN	550 633 268,88 AZN
2014	59 014 100 000,00 AZN	238 994 129,60 AZN
2015	54 380 000 000,00 AZN	1 580 275 095,00 AZN
2016	60 425 200 000,00 AZN	1 722 779 638,88 AZN
2017	70 135 100 000,00 AZN	2 160 619 444,00 AZN

Table 1: GDP and Azerbaijan Natural Gas Export value by years (stat.gov.az)

Table 1 shows the volume of GDP in the Republic of Azerbaijan for the years 2006-2017 and the total value of gas export. MS Excel can be used in mathematical software packages for regression analysis of the dependence between GDP and gas exports using the above indicators. For this purpose, using the MS Excel software package, we will have the following result based on Table 1 data.

Regression Statistics	
Multiple R	0,75030842
R Square	0,562962725
Adjusted R Square	0,514403028
Standard Error	8634132082
Observations	11

ANOVA	df	SS	M	F	Significance F
Regression	1	8,64253E+20	8,64253E+20	11,59320915	0,007812699
Residual	9	6,70934E+20	7,45482E+19		
Total	10	1,53519E+21			

Column1	Coefficients	Standard Error	t Stat	P-value
Intercept	42001081822	3607094240	11,6440212	9,94734E-07
Natural Gas	12,26740061	3,602887593	3,404880195	0,007812699
	Lower 95%	Upper 95%	Lower 95.0%	Upper 95.0%
	33841267749	50160895895	33841267749	50160895895
	4,117102636	20,41769858	4,117102636	20,41769858

Table 2: Regression analysis of GDP and Gas Export Value (it has been prepared by authors)

According to the result of the program package, the regression equation will be as follows:

$$Y = \alpha_0 + \alpha_1 * x_1$$

Substituted Coefficients:

$$Y = 42001081822 + 12,26740061 * X_1 \quad (1)$$

According to this equation, it is possible to conclude that a single increase in the value of gas export in the Republic of Azerbaijan causes a 12,26740061 increase in GDP. The multiplicity correlation coefficient indicates the relationship between the free variable (X1), which indicates the factor input Y with the dependent variable $R^2 = 0.562962725$. Determination $R^2 = 0.562962725$ means that the corresponding regression equation is 56.3% dispersion results, 43.7% by other factors. This means that with the increase in gas export in Azerbaijan, GDP will also increase. One of the key issues in the Republic of Azerbaijan is to ensure the reduction of oil revenues in the future with gas revenues. With the help of the F-Fischer criterion, it is possible to check the statistical significance of the whole set of regression equations. For this purpose, the F-Fischer criterion should be compared with the $F_{cal}(a; m; n-m-1)$ price. According to Table 2, which reflects the outcome of the MS Excel software package

$$\mathbf{F\text{- statistic (Fişer kriteriyası) = 11,59320915}}$$

Let's check the F-statistic price with the table price.

$$\mathbf{F_{table}(a; m; n - m - 1) = (0, 05; 1; 10) = 4,9646}$$

The F-Fischer criterion, $F_{table}(11.59 > 4.96)$, is compared with $F_{table}(a; m; n-m-1)$. This means that the regression equation is of a statistically significant character. This means the adequacy of the model (1). As a result of the research, it was determined by calculating the elasticity factor that 1% increase in gas export value from Azerbaijan affects 0.16% GDP growth. As oil revenues have a positive impact on GDP growth after the signing of the Century's contract, the increase in gas exports will have a positive impact on GDP. As a result of the fall in oil prices, a decline in foreign currency was observed in Azerbaijan. TAP and TANAP projects create new opportunities for Azerbaijan through gas exports to Turkey and Europe.

4. CONCLUSION

One of the main important issues in energy sufficiency and energy security is the consideration of economic and political interests of countries which import and export energy carriers. Nowadays, it is a necessity to work in cooperation with interested countries and taking into account the need for energy. TAP and TANAP projects, which have emerged as a result of international cooperation and partnerships, also serve to boost competitive environment in Europe's energy security. The most favorable sources of gas export to Europe in terms of price and transportation are the Caspian Basin, Russia and Central Asia. The most convenient way to export gas from Azerbaijan, Iran, Iraq and Turkmenistan is to ensure that this gas is transported via Turkey. After completion of the TAP project, export of gas to Europe will be a convenient way not only for Azerbaijan, but also for other countries. Looking at the World Bank's gas prices, we can say that the forecast given till 2030 shows that gas prices in Europe are on the rise trend.

Figure following on the next page

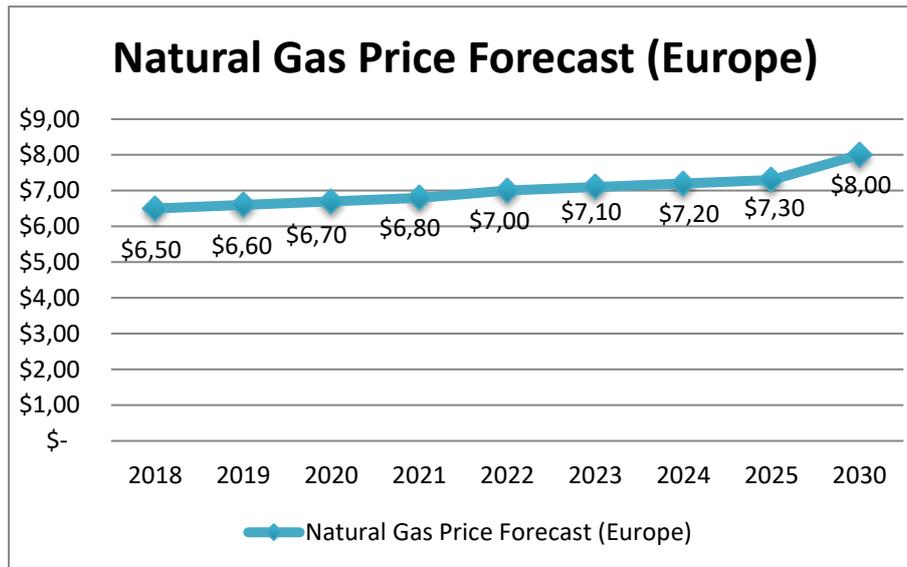

Figure 2: Natural Gas Prices Forecast in Europe (World Bank Commodities Price Forecast)

Also, Nandita Parshad, Energy and Natural Resources Director of the European Bank for Reconstruction and Development (EBRD), said that TAP and TANAP projects fully comply with European Union standards and EBRD performance criteria, and noted the high economic efficiency of these pipelines. EBRD also assessed the financial ratings of these projects as AA. The Bank has provided TANAP \$ 500 million in financial support. Generally, since 1994, when the "Contract of the Century" was signed in 1994, Azerbaijan was the initiator and participant of many large oil and gas projects. The experience of these global projects guarantees that Azerbaijan will successfully complete the TAP and TANAP projects and these projects will have a positive impact on the relations between Azerbaijan, Turkey and Europe.

CRISES IN THE GLOBAL FINANCIAL SYSTEM: ANTI-CRISIS POLICY - THE STAGES OF REGULATION

Mirelem Heseli

*Professor at Azerbaijan State University of Economics (UNEC), Azerbaijan
Department of Finance and Financial Institutions
m.hasanli@unec.edu.az*

ABSTRACT

Purpose of the study. Investigation of the gaps in the global financial system and the disclosure of the main directions of the anti-crisis policy. Research Methodology. Summarize, analyze and evaluate. Results of the study. Countries around the global financial crisis are taking different action. State programs implemented in recent years in order to prevent this crisis in our country and the implementation of the infrastructure projects proved that these measures are purposeful. Developed countries today say that the intention to accelerate the construction of infant structure and social facilities to overcome the emerging financial crisis indicates that the anti-crisis action plan of the Government of Azerbaijan against the financial crisis and the future will be resolved. The strong energy potential of our country in recent years also reaffirms this idea.

Keywords: *Anti-crisis policy, Economy, Financial crisis, State world*

1. INTRODUCTION

Financial crises tend to not happen as a rule. When we look at history, we can see that this crisis, as well as the previous ones, has gone through several stages. In the early stages of the crisis, crises seemed relatively quiet, and then led to severe consequences and economic downturn. One of the main reasons for the global economic downturn was the decline in production facilities and the decline in real capital investments. There is a certain correlation between the price change and the exchange rate. There is a close correlation between the rate of the national currency, the depreciation of the currency, and the production of the product. The short-term capital that enters and leave the country also have a significant impact on decline of the local currency. The other reason for the financial crisis was the lack of placement and involvement of bank loans and the problem of liquidity in the world's largest banks. Suspension of financial operations by major companies due to the crisis has also been caused by the sharp decline in the shares of the banks. At the same time, sharp price changes in the world oil market had severe effect. At the initial stage of the financial crisis, the United States has in just one month spent \$ 514 billion to buy oil. Of course, this has led to a deficit in foreign trade, and ultimately the US debt of \$ 5.3 trillion. In our view, the biggest problem that may arise in the future for the global financial system may be issue of additional funds. Because cash flows into circulation without commodity mass is one of the conditions that accelerate inflation.

2. MAJOR FINANCIAL CRISES OF THE XIX-XX CENTURIES

The financial crises of the 19th-20th centuries were largely remembered by similar features. At that time, it was difficult for business to get loans, and banks increased interest rates and borrowers become enable to pay off their debts. At the same time, the prices began to decline, and banks, credit and financial institutions had to be bankrupted and suspended their activities. Almost all the crises that had emerged begin in this way. The United States, Britain, France and Germany in 1825, England in 1825, Britain in the United States in 1836 and in the US in 1841, finally in 1847 were stroke by the crisis. Afterwards, the 1858 crisis, the economic crises of 1873, 1882 and 1890 have frustrated the world economy. Then, the 1929 crisis, the collapse of the stock market entered the history as "Black Tuesday" (October 29, 1929).

The crisis that took place in 1929-1933 covered all financial sectors and was so devastating that left in shadow the previous crisis.

3. CRISIS IN THE FINANCIAL SYSTEM AND STAGES OF THEIR REGULATION IN DIFFERENT PERIODS IN THE UNITED STATES

The crisis in the US financial system has been largely regulated by the budget-tax policy and has gone through several stages. For example, the first stage covering the 1920s and 1970s provided a solid budgetary system in the United States. Meanwhile, the budget system was characterized by the following features:

- The federal budget had an extensive public destination;
- As a result of the policy of the presidents Nikson and Jonson the creation of a "large society", the share of social spending in the federal budget has significantly increased;
- The expansion of war in South East Asia and the beginning of the Cold War coincided with a significant increase in military spending over time.

There was a steady increase in the federal budget deficit. During this period, public criticism of excessive budget spending on the needs of public administration was enhanced. About one-fifth of the world's GDP is USA's GDP. The United States is home to about one third of world production, and is the world's largest economic. Compared to other countries, the 1950s and 1960s were the highest peak of US economic development. Since 1961, economic development has fallen to weaken and finally the 1970s civil crisis has accelerated the process of division of the US economy into three zones: the northern, southern (more rapidly developing in the oil industry) and western (rapidly developing new technologies) building). All of these crisis factors have simultaneously been reflected in the fact that the US budget system has been formulated throughout the long term. The second stage of the 1971-1980s: This stage is mainly related to budget reform and its key features are as follows:

- More efficient re-distribution of budget-tax funds among power levels. - Government expenditure optimization.
- Defining a clearer balance between the budget executive duties of the Presidential Executive Office and the controlling powers of the Congress.

The third stage, applied in 1981-1988, is called "New federalism" policy. This is what the former presidents Nixon and Jonson's "pursuing a policy of creating a great society." The objectives of the "new federalism" were to prevent crisis situations in the state financial system. At that time, the essence of Reagan's reforms was that the state was underestimating the cost of social programs and reducing costs. In our opinion, as the positive results of the "new federalism" policy can be distinguished as follows:

- Increasing the sustainability of the American financial system is a high level of flexibility against changes in its budget and tax policy.
- The slowdown in the growth rate of the federal budget expenditures, which increases the importance of territorial budgets.
- Increase of taxes levied by the state authorities for social expenditures.
- Partial reduction of the previous over-centralized system of social and other software management.

B. Clinton's presidency period is the fourth-rate budget policy of the 1990s. At that time, the measures used were purely financial:

- Reduction of budget deficit and tax burden;
- Modernization of production and application of new technologies;

- Renewing economic activities aimed at increasing economic growth rates.

As a result of the flexible economic policy of the US government and the development of a highly efficient capital market, the development of new high-tech production and service industries in 1990 the US has once again demonstrated its economic power. The main factor of the economic growth of the 1990s is the growth of private investments and consumption of the population. The increase in private investment dropped more than 30% of the GDP after 1991, the highest figure in the post-war era. In the US in 1992-1997 the premium rate increased to 20% of GDP. The share of public spending in GDP declined from 22.4% in 1992 to 18.7% in 1999. This has been the lowest since 1996. It was during that period that the US economy's long-term rise took place. Clinton was at that time noting that "our main goal is to liberate the United States from foreign debts which we could never have dreamed five years ago". The president had planned to pay full public debt until 2013. Clinton's budget plan, which was in effect in 1993, included the following:

- Reduction of the federal budget deficit for 5 years.
- Increase the basic federal taxes (individual income tax and corporate tax).
- Strengthening the tax burden for business profit and reducing federal costs.

In 1993-1996, the tendency of the economic situation improved considerably. Inflation rates are the greatest achievement of the economic policy of this era. In 1996-1997, Clinton proposed the following major measures that enlarged the 1993 plan and the target were achieved:

- Large tax incentives have been applied to higher education and individual taxpayers.
- Mild reduction of costs for working families to pay for childcare costs.
- Expanded non-taxable personal pension accounts.
- The non-taxable amount has been increased up to \$ 2,000 a year.
- Significantly expanded the circle of Americans who have the right to receive a direct tax subsidy, but who have fewer opportunities.
- The program of wide expansion of children's health insurance was approved by and passed in Congress

Fifth stage is G. Bush's financial policy. Bush described the main directions of his policy as his "smart and responsible" policy:

- Promoting tax benefits and encouraging economic growth.
- Increase military spending by 26% to strengthen national security.
- National security management and its reorganization.
- Reaching 700,000 barrels of oil's strategic reserves to ensure energy security of the country.
- Increasing the scholarships for scholarships and research by 26% and increasing students' scholarships from \$ 18,000 to \$ 30,000.
- Providing tax incentives to 109,000 paying users.
- Opening new jobs to strengthen the economy.
- Increase financing by 36% for timely medical aid to war veterans.

Starting from the second half of 2003, the signs of improvement in the American economy have been notable, which included:

- GDP growth rate;
- Volume of industrial production;
- Private investment in production;
- Consumption costs;
- Retail trade turnover;

- Volume of foreign trade in products and services.

Finally, the crisis that started with the mortgage bankruptcy in the US in 2008 showed itself in some other leading countries in the world. It is known that the cause of the global crisis is largely the American mortgage and the entire financial system collapse. The low interest rates in the US have increased the attractiveness of loans for the most diverse segments of the population and the number of unsecured loans. As a result, the sharp decline in oil prices led to the rise in inflation and the reduction of state budget revenues.

4. ANTI-CRISIS POLICY OF THE GOVERNMENT OF AZERBAIJAN IN THE CONTEXT OF GLOBAL FINANCIAL CRISIS

In the International Monetary Fund's report on Azerbaijan, while discussing the short-term forecasts of the 2009 state budget and the impact of the crisis on the country's economy, it was noted that the strong economy in our country's fast dynamic dynamics and its contemporary situation is resistant to the global financial crisis has come. This report also notes that financial support to the non-oil sector was observed in construction and services. It should be noted that just the assets of the State Oil Fund are a few times higher than the total debt burden. At the wrap-up meeting of the Cabinet of Ministers on the outcome of social and economic development in 2008, President of the Republic of Azerbaijan Ilham Aliyev in its final speech said that the ongoing global financial and economic crisis has affected the whole world, and as Azerbaijan is a part of the world and successfully integrated into the global economy, all of these factors undoubtedly could have a negative impact on the economy of our country, and that the reduction of this impact was the main task of the government. The period before the global financial crisis (2008) was very successful for the Republic of Azerbaijan from the point of view of socio-economic development. Looking at the dynamics of economic growth, Azerbaijan was one of the first in the world for this indicator. The achievement of this success has also played an important role in the implementation of the State Program on socio-economic development of regions that have been consistently implemented in recent years. The dynamic growth of new workplaces has created a stimulus for the socio-economic development in the regions as a whole. All of this gives us grounds to conclude that the socioeconomic policy in the country is undergone to be met and effectively implemented. Apparently, the main direction of the state's economic policy is the dynamic development of infrastructure and non-oil sector. As for the economic system of Azerbaijan, it should be noted that it is very flexible and demonstrates its commitment to the protection of the national economy from serious financial shocks. The development of this system can be divided into four main stages:

The first stage covers 2003-2008 years period. In this period, the main priorities of socio-economic policy have been defined in Azerbaijan:

- Continued money-credit and exchange rate policies that support macroeconomic stability and its preservation, sustainable economic development and poverty reduction.
- Increase the effectiveness of the financial intermediation function of the banking system, strengthening the protection of the interests of customers and bank lenders.
- Continuously develop financial markets, financial institutions and derivative financial instruments to ensure dynamic growth of government revenues.
- Provide sustainable and high growth rates in industrial production by stimulating national production.
- To ensure the stock market formation that strengthens the position of the country in the global capital market.
- The policy of socio-economic development of the regions is mainly related to the development of the non-oil sector, the restoration and expansion of the operations of the

industrial enterprises, the stabilization of export-oriented production, the development of local entrepreneurship, and the further improvement of the living standards of the population.

- Further improvement of the environment or environment in order to ensure sustainable and balanced development in the long run.
- Effective use of state revenues for the well-being of the population, ensuring transparency in the financial system.
- Creating new jobs. The main goal in this area is not everyone's getting a job.
- To meet the population's energy needs, to ensure the sustainable development of the non-oil sector.
- Ensuring productivity increase in agriculture.
- Expansion of financial and credit services networks in the agrarian sphere and ensuring food security of Azerbaijan.
- Raising the socio-economic development of the regions to the level of modern requirements (State Program for Socio-Economic Development of Regions 2004-2008).
- To continue the balanced foreign policy course, to further extend international economic cooperation.

The second stage covering 2009-2013. Challenges to minimize the negative impact of the global financial and economic crisis on Azerbaijan:

- Ensure the implementation of infrastructure projects and other socio-economic projects for 2009.
- To control the consumer market and to avoid artificial price exacerbation, to strengthen anti-trust activities, to put an end to unsubstantiated monopoly and unhealthy competition.
- To look at the possibility of a part of Azerbaijan's currency reserves to be placed in Azerbaijani banks.
- Maximum implementation of all social programs.
- Azerbaijan should keep its importance as an attractive country for foreign investors and to focus on investing in the construction of more infrastructure areas.
- Pay great attention to food safety issues.

The third stage, covering the years 2014-2016, is characterized by the implementation of socio-economic projects, particularly 2016 - the year of economic reform. As a result of the implemented reforms, Azerbaijan's economy has been adapted to the requirements of the non-oil sector.

All the achievements in the II and III stages indicate that Azerbaijan's economic potential is determined by the consistent success of government's successful economic policy that today, more than 65% of the national economy falls to the private sector. Socio-economic reforms, along with serving the comprehensive development of our country, strengthen our state and ensure its economic development.

The fourth stage covering 2017-2025. The main priorities of this new phase are to increase competitiveness in the local economy. For this purpose, the Strategic Road Map has been compiled on the national economic perspective of new economic reforms. This document provides for a one-year-long roadmap, economic development strategy and action plan for 2016-2020, as well as a long-term forecast for 2025 and a strategic target for the post-2025 period. Strategic review phase since 2017. This stage is divided into three periods:

- Strategic review period by 2020.

- A long-term strategic review period by 2025.
- Strategic target review period for the post-2025 period.

Under this strategic vision, 11 sectors were functionally created. As a strategic target, increasing the competitiveness of the economy on the basis of providing sustainable economic development of Azerbaijan and strengthening its position in the global regional value relationships, further improve the social well-being, the legal framework, protect human rights and freedoms, the objective is to increase the effectiveness of the reform. From the aforementioned, it can be concluded that the global financial system weakened the world economic system and created serious problems. In some countries, unemployment has gradually increased as some manufacturing facilities ceased to exist. The current financial situation of our country gives grounds for eliminating the negative consequences of the global economic crisis.

5. CONCLUSION

In our view, it is not possible for the current world economic crisis to last long, because oil cannot be sold for a long time at a price lower than the May value, i.e. \$ 50. It is also unlikely that the upper limit of its price would rise up to \$ 150. If the world faces a long-term financial crisis, our national economy should consider how to overcome the negative consequences of the crisis. Proper integration of assets and resources in the conditions of integration should be the main task of financial institutions of each country. One of the reasons why Azerbaijan's financial crisis has not been seriously affected is the development of the oil sector, as well as the creation of permanent jobs in recent years in order to minimize unemployment. This results in a significant reduction in the country's financial system and its financial dependence on the outside. Apparently, the financial crisis in the world, despite the massive unemployment situation, continues to lead to the sustained pace of its development, the development of the non-oil sector, the creation of new jobs, and the socio-economic development of the regions. The State Program is being implemented.

ABSTRACT

The article is devoted to the development of new directions of optimization of management technologies, administrative processes and organizational structures. The features and the need to apply the principles of effective resource management, attention to the needs of the customer, focus on the problem of elimination of all types of losses, the full use of the intellectual potential of the personnel of the enterprise for the development of management innovation. The methods, principles and basic tools of lean production technology are studied, the possibility of their application in the management process is analyzed. In modern conditions of economic development, innovation and innovation determine the competitiveness of national corporations on the world market and are the most important factors for the effective development of the economy as a whole. In international practice, little attention is paid to innovation in management, and the development of enterprises is mainly associated with technical and technological innovations. However, the effectiveness of the Corporation's management is reflected in the performance of new equipment and technologies. Since the renewal and development of any activity occur due to the improvement of methods of its implementation, it is necessary to introduce innovative conceptual approaches to the improvement of the management system that determine the innovative strategy of the Corporation. One of the methods to improve the efficiency of corporate management and improve its activities is the introduction of the concept of lean production.

Keywords: *Management innovations, Lean technologies, Lean production in management, Innovative development*

1. INTRODUCTION

Management innovation is the new knowledge that is embodied in new management technologies, new administrative processes and organizational structures, such as the introduction of new methods of organization of work, structuring tasks, resource allocation, determination of remuneration and others.

Managers have the potential to increase profits, which are often underestimated. As a result of the use of managerial innovations, the organization not only acquires long-term competitive advantages, but also receives managerial profit, which is one of the important results of the implemented transformations. With the gradual saturation of commodity markets and increased competition, many Russian leaders are beginning to think about improving the competitiveness of their business. Innovation is not only some global idea to modernize the enterprise or introduce new systems, but also small ideas to improve various processes that help to produce better products or provide better services. New unique technologies are replacing the usual for all ways of working. To be successful, the organization must constantly evolve and be dynamic. Organization - a living organism that is constantly moving, either in the direction of development or in the direction of decline. All organizations are aimed at development, therefore, their goal is only positive development in the direction of growth. In this regard, change management is one of the most popular technologies, techniques in the management of the organization, business. This program allows you to transfer the team, the organization from the current state to the desired future. One of the types of management changes in the organization is the introduction of lean manufacturing. Lean production – a new attitude to work, to production, a new attitude of employees to everything (Raju et al., 2017, pp. 145-151).

2. METHODS, PRINCIPLES AND BASIC TOOLS OF LEAN PRODUCTION TECHNOLOGIES

2.1. Lean manufacturing methodology and principles

During the period of the highest competition and the aggravating crisis, the enterprises of the whole world have no other way than, using the best world technologies of management, to create the products and services which are the most satisfying clients on quality and the price. The main objective of the production system is the continuous improvement of the "value stream" for the consumer, which is based on a rational combination in time and space of all major, auxiliary and service industries. This allows you to produce products with minimal labor costs and depend on the economic performance and results of the enterprise, including the cost of production, profit and profitability of production, the value of work in progress and the amount of working capital (Stepchenko, 2015, p. 5508). Lean production is based on the disclosure of the creative potential of the company's employees. Unlike other management technologies focused on strict regulation of activities, this approach allows involving employees of all levels in the process of optimization. At the same time, a complex effect is achieved: the company works more efficiently, employees are involved in the project implementation process and have the opportunity to improve their working conditions and material compensation. The starting point of lean manufacturing is value for the consumer. From the point of view of the end user, the product (service) acquires real value only at the time when there is a direct processing, production of these elements. The basis of lean production is the process of elimination of losses. Losses in any production process are an inevitable problem for many enterprises, both producing products and providing services. Loss is a condition that does not add value to a product or service. We can distinguish the following losses of the enterprise:

1. Loss of creativity.
2. Excessive production, which means that more goods are produced than required, or earlier than required by the customer.
3. Delays. When workers are idle waiting for materials, tools, equipment, information, it is always a consequence of poor planning or insufficiently established relations with suppliers, unexpected fluctuations in demand.
4. Unnecessary transportation when materials or products are moved more frequently than necessary for a continuous process. It is important to deliver everything you need in a timely

manner and in the right place, and for this the company must be implemented good logistics schemes.

5. Excessive stocks, or storage in warehouses of more products than are sold, and more materials than are necessary for the process.
6. Excessive processing. The products must come out of production of such high quality that as far as possible to exclude its alterations and improvements, and quality control should be fast and effective.
7. Defects that should be avoided by all means, because the settlement of customer claims take additional funds: if you need to fix a defective product, spent extra time, effort and money.

In accordance with the concept of lean manufacturing, all activities of the enterprise can be classified as follows: operations and processes that add value to the consumer, and operations and processes that do not add value to the consumer. Therefore, anything that does not add value to the consumer, in terms of lean manufacturing, is classified as a loss, and should be eliminated (George, 2014, pp. 295-303). The main objectives of lean manufacturing are:

- cost reduction, including labor costs;
- reduction of production creation time;
- reduction of production and storage space;
- guarantee of delivery of products to the customer;
- maximum quality at a certain cost or minimum cost at a certain quality (Kolesnikova et al., 2009, pp. 41-43)

2.2. Lean production methods

Pull production - the scheme of the organization of production at which volumes of production at each production stage are defined exclusively by needs of the subsequent stages (finally – needs of the customer). The ideal is "the flow in one product" ("single piece flow"), i.e. the supplier (or the supplier), located upstream, produces nothing as long as the customer (or internal user) that are below, he was about misleading. Thus, each subsequent operation "pulls" products from the previous one. Such a method of work organization is closely connected also with the balancing and synchronization of threads (Goldsby et al., 2016, pp. 277-281). Canban is a system that ensures the organization of a continuous material flow in the absence of stocks: production stocks are supplied in small batches, directly to the desired point of the production process, bypassing the warehouse, and the finished product is immediately shipped to customers. The essence of the Canban system is that all production units of the enterprise are supplied with material resources only in the amount and by the time required to fulfill the order. The order for finished products is submitted to the last stage of the production process, where the calculation of the required volume of work in progress, which should come from the penultimate stage. Similarly, from the penultimate stage there is a request for the previous stage of production for a certain number of semi-finished products. That is, the size of production at this site is determined by the needs of the next production site. Kaizen is a derivative of two characters – "change" and "good" – usually translated as "change for the better" or "continuous improvement". In the applied sense, Kaizen is a philosophy and management mechanisms that encourage employees to offer improvements and implement them online. There are five main components of Kaizen: interaction, personal discipline, improved morale, quality circles, suggestions for improvement. System 5S-technology for creating an effective workplace. Under this designation is known system of restoring order, cleanliness and discipline. 5S system consists of five interrelated principles of the organization of the workplace:

- sorting-separating the necessary items: tools, parts, materials, documents, from unnecessary to remove the last;
- rational arrangement-put each item in its place;

- cleaning - maintenance of cleanliness and order;
- standardization-accuracy through regular implementation of the first three S;
- improvement - becoming a habit of established procedures and their improvement. (Fabrizio et al., 2012, pp. 74-81)

SMED — Single Minute Exchange of Die approach to changeover and re-tooling. As a result of the introduction of the system SMED change of any tool and readjustment can be made in just a few minutes or even seconds, "one— touch" (the concept of "OTED" - "One Touch Exchange of Dies"). Principles to reduce changeover time by tens or even hundreds of times:

- separation of internal and external setup operations,
- conversion of internal operations in external,
- use functional clamps or eliminate fasteners,
- use of additional devices.

System TPM (Total Productive Maintenance) – mainly serves to improve the quality of equipment, focused on the most efficient use due to the universal system of preventive maintenance. The emphasis in this system is on the prevention and early detection of equipment defects that can lead to more serious problems. TPM involves operators and repairers who work together to improve the reliability of the equipment. The basis of TPM-scheduling preventive maintenance, lubrication, cleaning and General inspection. This ensures an increase in such an indicator as The full Efficiency of the Equipment. System JIT (Just-In-Time) is a material management system in production where components from a previous operation (or from an external supplier) are delivered exactly when they are required, but not before. This system leads to a sharp reduction in the volume of work in progress, materials and finished products in warehouses. The "just in time" system assumes a specific approach to the selection and evaluation of suppliers, based on the work with a narrow range of suppliers selected according to their ability to guarantee the supply of " just in time " high quality components. At the same time, the number of suppliers is reduced by two or more times, and long-term economic ties are established with the remaining suppliers (Vumek et al., 2018, pp. 301-316). A visualization is any tool that informs you about how your work should be done. This is the placement of tools, parts, containers and other indicators of the state of production, in which everyone at first glance can understand the state of the system - the norm or deviation. The most commonly used visualization techniques are: contouring, color marking, road sign method, paint marking, graphic work instructions. U-shaped cells - the location of the equipment in the form of the letter "U". The U-shaped cell machines are arranged horseshoe-shaped, according to the sequence of operations. With this arrangement of equipment, the last stage of processing takes place in close proximity to the initial stage, so the operator does not need to go far to start the next production cycle.

3. THE USE OF LEAN-TECHNOLOGY IN THE MANAGEMENT PROCESS

3.1. Lean-system and lean-culture

Production efficiency in most enterprises is directly related to the complexity and duration of the production cycle. The longer this cycle, the greater the number of auxiliary and service industries involved in it, the less effective is the production as a whole. This pattern is explained by the obvious need to spend a lot of effort to coordinate all actions to ensure uninterrupted supply of the main production of raw materials, energy, equipment maintenance, transportation and storage of products, loading and unloading. Failure of the equipment at one technological stage can lead to failures in the operation of the entire production, up to its complete stop. Thus, the solution of the problem of stable functioning of the entire production system becomes particularly important for increasing efficiency and achieving the best results.

One of the ways to solve this problem is the introduction of Lean-technology system, which is designed to optimize production processes, constantly improve product quality with constant cost reduction. The system is not just a technology, but a whole management concept, involving the maximum orientation of production to the market with the interested participation of the entire staff of the organization. The experience of implementation of the described technology, at least in the form of separate elements, at the enterprises of various industries showed its prospects, so that there is no doubt the need to study this experience and further expand its scope. Through the introduction of lean production methods at the enterprise, it is possible to solve the main management tasks: to minimize costs without reducing the level of quality of the final product, to speed up the production process, to prevent overproduction and overstocking, to debug supply channels. With the full-scale use of lean manufacturing approaches, the company creates a full-fledged Lean system that permeates all levels and subsystems of management. Within the framework of this system, the company's employees perform work operations with optimal methods (replication of best practices). Line managers daily monitor production losses and take operational actions to prevent, eliminate or reduce them. In this they are helped by optimizers-employees of a special service who have in-depth knowledge of approaches and tools of Lean production. Management plans and conducts its activities in terms of efficiency of production, which is monitored daily and sometimes even hourly. Of course, all this is supported by a common Lean culture (which, by the way, can be mastered in our country-there are examples), when, for example, to move up the career ladder, it is necessary to develop and implement an improvement for the process in which you work. It takes several years and a large amount of money to form a Lean system. In most cases, there is no need to implement a full-scale lean system to identify and implement internal reserves, you can use the idea of lean manufacturing and some simple lean technologies to get significant results in a short time. Of course, the possible effect in this case will be slightly less than from the lean-system, but the increase in labor productivity by 1.5-2 times is also a very desirable result. Together with the optimization of other costs, this can give a significant increase in profits (Russell, 2012, pp. 128-135). By implementing continuous improvement in the form of lean manufacturing, many companies are more dependent on internal problems and obstacles than on external ones. Most of the internal factors simply lead the development of a new production system into a corner, into a dead end, calling into question the further implementation of this global and necessary project. Lean enterprises differ from others in the following:

1. The basis of the production system of such enterprises-people. They are a creative force in the production of competitive products, and technology and equipment – only a means to achieve their goals. No theory, strategy, technology will make an enterprise successful; it will be achieved only by people on the basis of their intellectual and creative potential. (Stryabkova et al., 2018, pp. 1501-1502)
2. Production systems of "lean" enterprises are focused on complete elimination of losses and continuous improvement of all processes. All employees of the company from workers to senior management are involved in daily work to prevent all possible types of losses and continuous improvement.
3. The management of the company makes decisions that take into account the prospect of further development, while the immediate financial interests are not decisive. The management of such companies is not engaged in useless administration-command, unjustifiably strict control, evaluation of employees with the help of complex systems of various indicators, it exists for reasonable organization of problem prevention. The ability to see and solve problems in the workplace is valued in every employee – from top management to workers (Dorzheva, 2013, pp. 159-161).

3.2. Lean technology Approach

The General approach in the case of local application of lean-technologies is a cycle of 5 steps. production process, timely detection, solution and The process of optimization of the organization begins with the study of problems. First, it is necessary to identify the problems that exist in the studied process and that will be solved with the help of lean technologies. At the first step, a list of problems and an array of information on them are formed. In the second step, an array of information is analyzed to understand the root causes. Next, you need to develop optimization solutions. It begins with the third step, which is the search for possible solutions using certain technologies (for example, "optimization Funnel", 5C, etc.) – there may be several. In the fourth step, the proposed solutions are evaluated in terms of their effectiveness to select the most preferred, and then develop and implement an action plan for their implementation. When developing an action plan, we should not forget that the studied and optimized management process can not be in a vacuum, i.e. changes in one process, as a rule, entail changes in related processes. With the help of standardization of activities, monitoring of parameters and other technologies of fixing solutions, the situation does not allow to roll back over time to the initial state. The fifth step should result in a stable functioning solution. After the process is improved, its content and parameters are changed, you can proceed to step 1 again. In this cycle the iterative nature of optimization is concluded.

4. CONSLUSION

In the context of increasing global competition, corporations will be competitive only when they use modern innovative methods of effective management. Lean Production is an enterprise management concept based on a constant desire to eliminate losses. Lean production involves the involvement of each employee in the process of business optimization. The main objective of the production system is to continuously improve the process of creating value for the consumer through a rational combination of time and space of all major, auxiliary and service industries. Thus, saving of time, material and labor resources is achieved, production cost is reduced, profitability of production increases, all economic indicators of production and economic activity of the enterprise are improved. Production or logistics based on lean technologies can cause a huge increase in labor productivity and production volumes. Lean technologies should become the main production system in many sectors of the world economy. Despite the many examples of efficient use of lean production tools, there are difficulties in introducing these methods into the activities of corporations on an ongoing basis. Lean production philosophy should become a corporate culture and way of thinking. The lean production system orients the company to work effectively in the long term only if it is possible to reorient the thinking of employees from technological tasks to the understanding of production, economic and financial relationships. Any implementation of lean manufacturing principles begins with personnel training, implementation of the philosophy of continuous, continuous improvement of the Corporation's activities in order to increase the value for the client. The introduction of lean manufacturing philosophy can be started from a separate workshop and spread the experience to all enterprises.

ABSTRACT

Article discusses the features of the use of financial resources in economic development at the present stage of development in Azerbaijan. Based on the lessons of world practice and the success of the financial policy pursued in Azerbaijan and studying the benefits of using oil revenues, the author found it extremely important to create a competitive environment in the national economy in conditions of high incomes. It has been established that the effectiveness of budget revenues should be the main goal of economic policy. In general, the article presents a systematic assessment of economic growth observed in recent years in Azerbaijan, including the rationalization of the aggregate structure of demand and payments, the balance of tax burden, budget deficit and inflation and, as a result, the sustainability of economic development. One of the important features of the modern stage of the world economy is the comprehensive nature of the problem of increasing the effectiveness of economic policy against the background of the trend of economic recovery. In our opinion, the main reason for this is the contrast current stage of economic development in the world. The fact is that the achievement of a new qualitative stage of development on the whole justified the actual rapprochement of traditional and axiomatic considerations as the basis of the humanitarian and social nature of economic activity.

Keywords: *bank policy, fiscal regulation, fiscal policy, marketing, monetary regulation, world experience*

1. INTRODUCTION

In recent years, world economic experience has shown that the rational use of resources in the national economy and the fair distribution of the generated income are one of the key conditions for the well-being of the population. From this point of view, of course, the state should strive to improve the well-being of the population, which affects the redistribution of economic resources and incomes. However, according to the theory of prosperity, with the prevailing competition, the principle of equality is that if there is equilibrium, then Pareto efficiency cannot be achieved, that is, no one can improve their well-being without reducing the welfare of others. (3) If we believe that social decisions are based on people's well-being, they are better informed about the best for the state.

From this point of view, the intervention of economic processes from the point of view of principles of justice is inexpedient. Nevertheless, the effectiveness of the Pareto will lead to division, namely: a competitive market does not provide only the social part of the benefits. Nothing prevents the creation of an unbalanced income distribution in such an economy. The market economy leads to a high level of inequality among people in terms of consumption and consumption. Thus, the problem of discrepancies and conflicts between efficiency and justice has become one of the biggest problems in the history of society. That is why, in our opinion, this should interfere with economic activity in order to ensure the principles of public justice.

2. SPECIFICATIONS OF FISCAL AND MONETARY POLISIES IN AZERBAIJAN UNDER MODERN CONDITIONS

The development of banking in Azerbaijan cannot be carried out in isolation from international banking standards and requirements without interaction with international financial organizations without creative use of existing international experience in this field. It is also necessary to ensure the interaction of the internal system with foreign banks, because the globalization of processes is being drawn into its orbit in all countries built within their national borders, open to the liberal market economy of the world community. As you know, conditions of good competition are often characterized by individuality. Thus, the competitive advantage of the market shows the ideal situation. The asymmetry of incompatibility, relatively small market volumes, monopoly capitalism, and other factors form the level of competitiveness in the market. Non-competitive markets do not ensure the efficient allocation of economic resources and incomes [5, p. 34]. One of the main instruments of macroeconomic regulation is fiscal policy. Fiscal policy implies a system of measures that the government implements in regulating government spending and taxation in order to regulate employment and inflation in the country. Fiscal policy provides for the implementation of changes in accordance with the existing tax rates for the implementation of part of the state budget revenues. This means that the state constantly intervenes in economic processes through fiscal policy. With this intervention, the government will strive to form a revenue part of the state budget. Fiscal policy is usually characterized as a set of measures related to government revenues and expenditures. The state intervenes in economic processes through its fiscal policy to regulate their progress. This intervention is a complex of measures taken in the field of taxation in order to form a profitable part of the state budget, increase the efficiency of the national economy, and stabilize economic growth and employment of the population.

Table 1: Implemented strategies and financial stability

Policy coverage	Main goals	The goal of financial stability
Prudential regulation	Limits to the activities of individual financial institutions	Identification of system risks.
Monetar	Price stability	Limit excessive changes in credit and asset prices during boom periods.
Regulation of exchange rate	Stability of exchange rate	Reduce volatility in capital flow.
Fiscal policy	Supply Cycle Management	Play fiscal protective role that can respond to stress in the financial system.

Source: Towards a global structure of financial stability. Azizov Y.S. Monetary regulation. Monograph. Baku, 2014, 375 p.

As can be seen from the table, each of the policies (prudential, monetary, or fiscal policy) has a main goal. The tools used within these policies are designed to achieve the ultimate goal. Many economists also note that one tool cannot achieve two goals.

But this does not mean that each instrument must be defined exclusively for one purpose. From this point of view, it can be noted that monetary and fiscal policies can be combined for secondary purposes. When we take separately, the policies we mentioned above are not able to provide financial stability. For this purpose, coordination of prudential and monetary policy should be one of the main objectives. Monetarists believe that by changing government spending and taxes, only temporary aggregate demand can affect earnings and employment, and therefore can have a more monetized policy and a more influential role in managing inflation. Fiscal policy is an integral part of the fiscal policy of the state and expresses the policy of budget formation [5]. Fiscal policy is the state budget and tax policy. Fiscal policy is a policy implemented by the state using expenditures, taxation and debt to influence aggregate demand, employment and income. [19, p. 78]. The fiscal policy system is a system that regulates a country's economic activity, affecting government spending and tax rates. The line of fiscal policy was formed as a logical result of state economic policy, as well as the adopted system of measures and is an integral part of the economic and political life of the state. For this reason, the line of fiscal policy can be useful for ensuring economic growth in the national economy, relative general stability, and business activity and can lead to completely different results. Therefore, the fact that the state plays a significant role in creating stable economic growth of the financial system requires proper functioning and systematic implementation of fiscal policy. It confirms the business experience of various countries, both developed and developed countries, as well as newly independent countries that have experienced a transitional period. Does fiscal policy affect economic weaknesses? Based on some key points of macroeconomic theory. Let's try to explain. The government spending multiplier according to the key model is the following formula described as:

$$mult_g = \frac{1}{1 - MPC(1 - t) - MPI + MPQ}$$

MPC - consumer addiction;
MPI - investment incentives;
MPQ - Trend Incl.
T - is the maximum tax rate.

Now the impact of fiscal policy on more specific situations in the economy. Let's clarify. Using the IS-LM-BP model, fiscal policy effectiveness depends on the degree of flexibility of the respective capital flows and the exchange rate regime. For example, capital in a country is immobile and floating exchange rate. Government spending ratios are defined as the ratio of the growth of GNP to the increase in government spending on the purchase of goods and services:

$$K_G = \frac{\Delta Y}{\Delta G}$$

You are here:
K_G - multipurpose government spending;
 ΔY is the increase in the gross national product;
 ΔG - indicates an increase in government spending.

It can be noted that the government spending multiplier is also expressed by the economic limitations of the final threshold of the quantitative trend - MPS and the newest trend of falling consumption - MPC:

$$K_G = \frac{1}{1 - MPC} = \frac{1}{MPS}$$

From here:

$$\Delta Y = \frac{1}{1 - MPC} \times \Delta G = K_G \times \Delta G$$

This indicates that if the state budget increases spending without increasing its income, such an increase will occur. It should be noted that taxes also create a multiplier effect, such as investments and government spending. At the same time, the impact of taxes on the gross national product compared with the impact of investment and government spending has its own characteristics. This means that the remaining income of the taxpayer is spent both on consumption and on accumulation. As a result, there is a decrease in consumption and a decrease in yield, as the income of the taxpayer decreases. The latter, on the other hand, determines the dependence on the consumption trend (MPS) on consumption reduction. Thus, to determine the reduction in consumption by including tax, it is enough to raise the tax burden to the end of the consumer trend:

$$C = \Delta T \times b$$

Here ΔT - indicates an increase in taxes, and b - the final consumption trend (MPC). Accordingly, the level of tax reduction as a result of additional taxes levied on the final tax burden threshold (MPS):

$$S = \Delta T \times (1 - b)$$

From this we can conclude that if the amount of taxes decreases to ΔT , the remaining income of the taxpayer will also increase to ΔT . Accordingly, consumption costs will increase ($\Delta T \times b$). This, in turn, will lead to an increase in the share of production from Y_{-1} to Y_{-2} . The ratio of GDP growth to tax increase is a tax multiplier:

$$V = \frac{\Delta Y}{\Delta T}$$

ΔY is an increase in gross national product, while ΔT reflects an increase in taxes.

Another important issue for budget management is financial objectives in the context of optimal tax burden. The tax burden in the economy of Azerbaijan and its trends of change are the countries of the world in countries with different levels of development [9, p.90]. The reasons for the diversity of tax burden, non-oil in Azerbaijan Svyazinvest between economic growth rates and tax burden is a quadratic regression model. The Armey curve for the non-oil economy was established and evaluated based on the above criteria. The optimal tax burden was calculated (20). Estimated optimal tax burden and the structure of tax revenues by comparing the differences with actual indicators The reasons for analyzing and improving the current tax system of the country of the proposal were made.

Optimizing or maximizing growth According to the tax burden approach, there is a certain level of tax burden (τ) economic growth rates (g) continue to grow to this level and τ^* at the maximum point. Model The essence is simple - the rate of economic growth of the direct tax burden and individual macroeconomic indicators, depending on the function, are expressed as $GT = a_0 + a_1\tau + \alpha_2\tau^2 + a_3X_t + x$ (1) Here τ is the tax burden, $\alpha_0, \alpha_1, \alpha_2, a_3$ - estimated parameters of the model, X_t - macroeconomic indicators affecting non-oil economic growth τ , - a model error indicator. Tax revenues in the structure - the share of direct and indirect tax revenues - taking into account (1) of the following two forms of equality were estimated: $GT = A_0 + a_3Kgt + a_2\tau^2 + a_1\tau + Add + a_4fd$ (1.A) $b_1\tau b_t GT = B_0 + b_3\tau d_t + b_2\tau b_t^2$ revenues to GDP, CGT - growth rates of investments in non-oil sector (control variable) a, b - model design parameters, F_d - layout of location variable (2005, 2009 and 2014, non-oil economic growth rates sharply reduced), et - model residuals (separately for each model). From the above we can draw the following conclusion:

- an increase in government spending on increasing the volume of gross national product, reducing government spending, reducing the volume of gross national production;
- Tax increases will lead to a decrease in gross domestic product, while tax cuts will lead to an increase in gross domestic product.

At the same time, it should be noted that the multiplier effect of tax cuts is weaker than the multiplier effect of an increase in government spending. Because when the amount of taxes decreases, consumption partially increases, but each unit of government spending directly affects the gross domestic product. Therefore, this factor plays a crucial role in the selection of instruments of fiscal policy and in terms of performance evaluation. Suppose the government implements a stimulating fiscal policy. The state of the increase in procurement will have a tendency to the right of the economy and the economy in 2 points will be. That is, interest rates and GDP growth will take place. The interest rate of foreign capital will be attracted to the country with an increase, and the balance of capital operations will be positive. But GDP growth, in turn, will lead to an increase in imports into the country, which is a deficit in the current account deficit. In this case, the current account deficit in the immobility of capital flows will lead to a balance of payments deficit and lead to a decrease in the national currency. A reduction in national currency will lead to an increase in exports. At the same time, imports will be cheaper than imported goods. The increase in net exports, in turn, will push IB and BP to the right. As can be seen from the chart, GDP increased from Y_1 to Y_3 with stimulating fiscal policies. Thus, the combination of a floating exchange rate and low capital mobility has a positive effect on the effectiveness of fiscal policy. Now the floating exchange rate and capital mobility are fiscal to explain the impact of politics on the economy.

Figure 1: Immobile capital and floating exchange rate

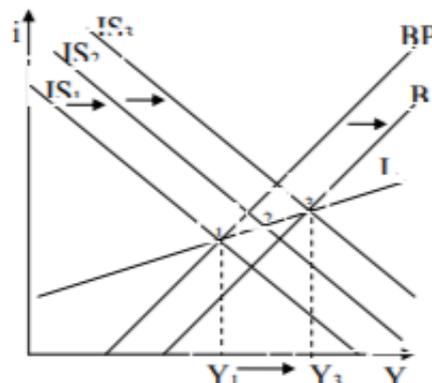

Table 3: Main macroeconomic reporters implementation of the Azerbaijan republic for 2016-2019

As is known from the table, for the first nine months of 2016, state budget revenues amounted to 1,208.3 million. US dollars. against 10,103.1 million manat or 16.5 percent less than in the previous year. The income forecast of the Ministry of Taxes of the Republic of Azerbaijan amounted to 4926.3 million manat included. 78.0 percent of this amount (9.6 percentage points more than the same period last year) or 3.843.8 billion manat. The share of revenues from the non-oil sector is 374.6 million manat compared to the same period of 2015. manat or 10.8% more. For the first nine months of 2016, state budget revenues amounted to 10,103.1 million. US dollars. manat, expenses - 10,622.2 million rubles. 519.1 million manat. The budget deficit (deficit) was created in the amount of 1,000 manat. In 2015, \$ 48.0 million. US other income of 90.5 million manat or 2 times more than the forecast. [7]

Table 4: The expenditures of the state budget of the Republic of Azerbaijan for 2012-2017 are as follows

Indicators with mln. Manats	2012	2013	2014	2015	2016	2017
To economy	4889.9	6803.2	6960.7	8205.7	7598.7	6408.9
To education	1180.8	1268.5	1453.2	1437.7	1553.9	1605.1
To medicine	429.2	493.4	609.4	618.9	665.3	708.2
To science	92.8	106.1	116.7	117.0	124.2	113.2

Profit breakdown	362.9	303.2	135.0	352.8	308.4	627.8
To the culture, and press, and sport	168.4	189.9	240.8	274.9	294.0	272.4
To Social Foundation	1123.0	1495.4	1769.5	1750.3	1971.2	1857.2
Support for law enforcement, judicial and prosecutions	668.5	710.3	929.2	1049.3	1103.6	1105.7
Payments of the state external debt	84.9	223.6	185.9	617.3	359.3	0.0
Payments of the state internal debt	6.9	120.2	26.5	110.9	19.6	0.0
Other expenses	2818.5	4048.8	4782.2	4610.2	4569.5	5283.0
General expenses of the state budget	11765.9	15397.5	17416.5	19143.5	18709.0	17784.6

In 2016-17, the state budget expenditures will amount to 84.3% or 17,786.8 million manat was executed. State budget expenditures by 2015:

- 10 361.5 million or 58.2% of current expenses;
- 6,720.9 million or 37.8% of capital expenditures;

As shown from the table a special place is occupied by the fiscal system, which acts as the vanguard of economic reforms carried out in the achievements of the Republic's economy. Reforms in the financial system cover not only the fiscal policy of the government, but also the internal structure of this system (Table 3).

4. CREDIT POLICY

One of the factors that temporarily affect foreign exchange demand in the markets is the credit policy of banks. The loans offered by Manat may increase the demand for currency and put pressure on the national currency. However, against the background of such factors as a weakening of the repayment potential of the real sector loan, an increase in problem assets and an increase in the debt burden due to the devaluation of the financial position of borrowers, as a result, compared to December 2015, credit investments in the economy decreased by 44% or 9.6 billion manats in November of this year. As a result, banks are decreasing liquidity. However, banks are not interested in lending existing risks. Mental auctions of the Central Bank allow them to hopelessly manage. Moreover, this is another factor that reduces the demand for loans in manats with higher interest rates. Thus, the probability of lending in manat in 2018 is likely to increase. This reduces the likelihood of pressure on the speed of manat in the indicated direction. Currently, the share of monetary policy has played a special role in fiscal policy, which is the main instrument for regulating the economy by the state, when the share of the non-state sector in gross domestic product has increased, and the transition to a more market economy in our country has played a special role. In modern conditions, the composition of revenues and expenditures of the state budget has undergone major changes. In the budget policy, the share of social spending, investment and capital expenditures was increased, budgetary salaries, pensions and state budget scholarships were minimized, relations with the state budget and local budgets, as well as the social security budget and other extrabudgetary funds and mutual economy-based. Economic stabilization creates tremendous opportunities to improve the efficiency and effectiveness of fiscal policy, including its fiscal tax policy, in the modern world, where economic processes are accelerating and economic security is being strengthened. The fiscal policy is considered as the main tool of economic policy as a purposeful activity of the state to determine the quantitative parameters and the main tasks of the formation of budget revenues [23, p. 110]. Monetary policy is crucial for the regulation of the economy of our country, and the methods for its implementation are as follows.

- Determination of interest rates on centralized credit operations.
- Determination of mandatory reserve standards.
- Conducting banking operations with securities in the free market.
- Providing centralized loans to credit institutions.
- Implementation of currency intervention and exchange rates.
- Restriction of banking operations.

Since the second half of 1994, the monetary policy pursued by the National Bank has been adjusted. The conducted monetary policy led to multivalued inflation. From this point on, the interest rate was a special role in monetary policy and the distribution of financial resources until the new policy was implemented. In times of crisis, the Central Bank seeks to intensify the specification by increasing quotas and lowering interest rates.

On the contrary, due to the rise in prices during the growth and imbalances in the economy, the Central Bank reduces lending. But monetary policy should not only maintain macroeconomic stability, but also promote and improve production and improve the overall economic environment. A strict monetary policy that ensures stability of the exchange rate and inflation is so important that it is possible to minimize the negative impact of politics on the economy. Today it is important that stable rates and low inflation are necessary for the successful implementation of economic reforms. To achieve this goal, it is necessary to create microfinance stability, which is real financial stability based on a sustainable economy. For this purpose, monetary policy should be linked to other economic policy blocks and serve the entire functioning of the economy as a whole.

5. EFFECTIVE IMPLEMENTATION OF FISCAL POLICY

Since budget revenues, budget commitments, budget deficit management are key areas of budget and tax policy, the effectiveness of this policy is assessed as the activities of the executive authorities in these areas. Government fiscal policy should be based on limiting inflation, limiting government spending to maintain relatively low interest rates in the credit market. Effective implementation of fiscal policy has a strong impact on the real economy. Therefore, the dynamics of key macroeconomic indicators serves as a benchmark for the implementation of fiscal policy (Table 3). In modern conditions, when new forms of ownership are created, economic rights and government bodies have broad rights to implement socio-economic changes, the relevance and importance of effective fiscal and tax policies are increasing. In the first nine months of 2016, the State Customs Committee of the Republic of Azerbaijan fulfilled a forecast of 125.6% to the state budget of 1,653.8 million manat, which is 529.6 million manat compared to the same period last year. manat or 47.1 percent more. From the State Oil Fund of the Azerbaijan Republic in the state budget 3260.0 million. Manat was included in the project, which is 2370.5 million. Manat or 42.1 percent less. Revenues from paid services of state-funded organizations amounted to 192.9 million manat. In the budget of other income AZN 70.1 million was received. The state budget revenues for July-September 2016 amounted to 3969.3 million manat was executed. [9].

Table 5: Money aggregates (end of period)

The deposits of non-residents and central government are excluded									

Source: The Central Bank of the Republic of Azerbaijan, 2018

As can be seen from the table, M2 in 2018 amounted to 12,744.9 billion manat. According to the statistical bulletin of the Central Bank, at the end of January, the aggregate M2 monetary aggregate amounted to 12,272.7 billion dollars. pounds. Compared to January, this figure increased by 472 million manat or 3.8 percent. The ratio of M2 to manat was 1.19 February in February 2018 and 1.54 in the corresponding period of 2017. Note that the M2 aggregate is equal to the sum of “cash outflows from banks (M0), manat deposits in manats and fixed

deposits in manats". Currency aggregates vary in different countries. The IMF has an overall M1 for all countries and is a broader "quasi-currency" indicator (term and savings bank accounts). The Central Bank of Azerbaijan has monetary units M0, M1, M2, M3:

- M0 = cash in circulation (coins, banknotes).
- M1 = M0 + checks, savings and deposits (as well as bank debit cards), balances of national currency in the accounts of organizations.
- M2 = M1 + emergency investment.
- M3 = M2 + deposits, certificates and government bonds.
- In addition, M4 units are also used in several countries. For example, in the United Kingdom, the M4 totality includes the cash flows in circulation, the total amount of loans issued and the amount of public debt.

In a country, the tax system should ensure that high profits along with higher taxes also create incentives to maintain high profits. In this case, the amount of taxes affects aggregate demand, the redistribution of wealth and aggregate supply. The level of taxes, their structure, is one of the main factors influencing the behavior of economic entities. Thus, by changing the structure of the state, the government affects the volume of aggregate demand, aggregate consumption, national savings and investment costs. At the same time, an increase in the tax burden on certain activities in the economic literature indicates a negative impact on economic behavior and economic growth. Although an increase or decrease in current expenditures of the state budget is important for regulating domestic demand, the allocation of state budget expenditures to current and investment expenditures is crucial in terms of economic growth (39, p. 89). The state fulfills the internal and external duties of its respective authorities through the monetary and material resources created by fiscal policy that is characteristic of all countries. In carrying out these duties, the state pursues social goals, such as improving economic growth rates of fiscal policy, smoothing out periodic fluctuations in the economy, achieving full employment and achieving a moderate level of inflation. These goals are achieved through various types of tax and tax rates, transfer payments and other instruments of public spending in the implementation of fiscal policy of the state. In society, there are limited opportunities for a range of social needs based on market principles. Because it is impossible to limit the use of public goods, and this restriction is undesirable. In such an environment, market people cannot benefit from public goods. Therefore, the state is investing, at least in the creation of public spaces. In addition, the investment decisions of the state are based on an assessment of social efficiency, and not on financial efficiency. The state improves social security by implementing small investment projects with high social efficiency and financial efficiency. In this regard, it is necessary to invest in the development of the industrial, social and institutional infrastructure of the state, which creates favorable conditions for economic activity, increases the competitiveness of the national economy, serves the social development of the population and regulates the country. At the same time, the role of the state in the investment activity in the country depends on the opinion of the government, the level of the country's basic infrastructure, the private sector with the ability to provide infrastructure services, forms, etc. This depends on such factors. In addition, public investment cannot be limited to infrastructure investments. Thus, in some cases, the low level of development of market entities requires the participation of the state in commercially oriented investment projects that are of great importance for the economic development of the country. All this requires state intervention in society and requires the provision of state blessings to the state. The state has a direct impact on the fiscal or fiscal policy of economic resources and the redistribution of income. Thus, the factors influencing the use of economic resources in different industries, as a factor determining the costs of production. Most state budget revenues are usually based on taxes. In most countries, the tax system is the main source of funding for social and economic programs

implemented by the state. However, the rent from natural resources also has a significant impact on the formation of state budget revenues. Increasing revenue from the use of government spending and government spending is the main purpose of taxation. At the same time, the state has a significant impact on the distribution of income and resources through taxes. Three aspects of taxation are important in terms of economic growth and macroeconomic equilibrium. First, if the impact of taxes on the influence of economic entities and their long duration, they can reduce the economic efficiency of consumers, producers and employees. These impacts should be considered when assessing the effectiveness of budget expenditures to be financed in the current period. Secondly, the divergent impact of the vagina on the income of the population, despite its economic efficiency, requires consideration of equality or equality that needs to be addressed. Third, the practical application of taxation rules and associated costs affects economic efficiency and public opinion on the integrity of the tax system. Public investment increases the pace of material, financial and information flows, reduces their cost and increases human capital, placing them in a country that goes beyond the scope of the private sector. These factors create favorable conditions for investment activity in the private sector. In general, public investment in economic growth (10) mainly affects the following ways [23, p. 72]:

- reduction of costs due to partial impact on operating costs, increased market access and access to information and increased competitiveness in import and export markets;
- increases the productivity of other factors (labor and other capital), which improves access to additional technologies, improves access to information flows and stimulates additional private investment;
- Structural impact on supply and demand. For example, the state infrastructure system helps to diversify the economy.

6. CONCLUSION AND RESULTS

Fiscal policy should be determined in accordance with the concept of socio-economic development of the country. This policy is gradually moving away from tight financial policies, reflecting macroeconomic indicators, increasing tax policy flexibility, increasing financial discipline, regulating the exchange rate of manat and other measures. The implemented comprehensive macroeconomic measures provide for the creation of favorable economic conditions for stable economic growth, increasing production volumes and increasing the level of employment in the non-oil sector, dynamic and balanced economic development of the country's regions, ensuring the economic independence of municipalities and local governments. In our opinion, the formation of the System of National Accounts used in the global budget classification, the International Financial Statistical Methodology and classifications used in different countries will help to ensure a more transparent and transparent classification of budget indicators, accounting for income and expenditure and economic direction, may provide for further differentiation of direction funds allocated to perform the functions and responsibilities of state and non-governmental bodies funded or knitted with the budget. Tax relations, the process of integration of our country's economy into the world economy, ensure that the tax policy pursued in the country is efficient, fair and at the same time requires a stable tax system. At the present stage of economic reforms in the country, investments in the development of industrial and public spaces should be part of the state budget. Budget revenues in fiscal policy of Azerbaijan act as the main source of state regulation of the economy. The correctness of the political context of this source may affect the budget mechanism with the possibility of reducing income not related to equity participation in the economy. From this point of view, it is necessary to direct the mechanism of the budget system to the direction of economic development and focus on actual and strategic planning costs. An important role is played by flexible and purposeful work to achieve macroeconomic stability.

Therefore, the implementation of fiscal policy primarily affects the macroeconomic situation in the country. The stabilization of the economy accelerates economic growth in the modern world and increases the economic security of the country, including improving its fiscal policy, including its fiscal and tax policies, and expanding the scope of its activities. In this regard, I consider it appropriate to carry out the following in order to increase the efficiency of fiscal policy.

- Stimulation of monetary policy should be regulated. This policy is aimed at stimulating the economy. Stimulating monetary policy focuses on the central bank. At the same time, the requirements for reserves should be reduced; the central bank should buy government securities.
- It is necessary to regulate restrictive monetary policy. You should avoid business activity, reduce inflation, and limit the monetary policy that the central bank should cover. These measures will: increase reserve requirements and sell government securities to the central bank.
- It is important to thoroughly study and analyze the tax policy of neighboring countries and other countries in the region, as well as the tax burden policy in order to increase the competitiveness of the national economy in terms of the optimal tax burden policy implemented to ensure the inflow of foreign investment in the country's economy.
- Preparation and implementation of a rational mechanism for the distribution of the tax burden on economic sectors, certain categories of economic agents is of great importance at the present stage of economic development. From this point of view, it is possible to achieve a balance of production, consumer and production factors with a gradual transition from production to tax burden.
- It may be advisable to move from a passive tax policy to an active tax policy at the present stage of economic development. For this, it is important to introduce the principles of active taxation and modernization, taking into account the need to create free technological economic zones and encourage the development of the economy of innovation and knowledge.

The distribution of revenues focuses on the formulation of the revenue base of local budgets, which is more responsive to the creation of a stable, efficient budget system at the local level. But there are some drawbacks. The provision of large tax authorities to local governments can lead to inequality in tax rules and related economic relations, violations of the location of economic facilities and differences in investments. It should be borne in mind that due to the imbalance of the tax potential, the use of the tax mechanism of taxation creates inequality in the level of budgeting, which makes the system of local budgets more socially tense if there is no unstable, operational budgetary regulation. Due to the aforementioned reasons, the method of tax distribution does not ensure the normal functioning of local budgets. Therefore, the method of taxation in the distribution of income is used in conjunction with the method of their distribution. A certain share of tax revenue can be transferred to the local level, even if the central part of taxes is levied by the center. The system of local additions for taxes levied on the use of the state tax base is economically viable. A stable state budget is the basis for the extensive production and dynamic development of the socio-economic situation of the population. Disruption of its balance and, as a result, the deficit of the budget deficit can create problems for the recycling process and the balance of the socio-economic status of the population. The credit policy of the Banks in Azerbaijan should consist of thoughtful operational concepts, rules and standards for credit operations, which are set out in accordance with the principles and rules of corporate governance.

The Credit Management Guide should clarify the following:

- Credit rating should be regulated;
- Regular analysis of individual loans of the Bank, the assets should clearly define the rules for classification and allocation of resources;
- It is necessary to determine the general structure and specific guidelines for solving problem loans;
- Take into account the risk of off-balance sheet risk;
- Procedures should be resumed to ensure that loan loss provisions, loan payments and expected cash flows are reflected;
- Credit, asset classification and resource creation
- Changes to the structure of regular reports should be added to the supervisory board;
- It is necessary to apply new standards for consistent assessment of the sustainability of the guarantee and the valuation of collateral;
- The loan or part of the loan amount (principal and interest amount) should establish procedures for determining the debt as impaired during the non-strengthening of the contract;
- Collateral valuation procedures should be updated with net realizable value.

ABSTRACT

The article deals with one of the important requirements - the processes in the direction of nationalizing programs used in the e-management system. E-education is the bridge between labour activity and education today. In return, it makes broad opportunities for education along the life. The article also encompasses 28 indicators of e-knowledge on Azerbaijan Information Society Group analyzed by State Statistics Committee. Beside this, application of electron systems to higher educational institutes has been analyzed. State position is indicated in this direction. Strategy and laws on Azerbaijan's education sphere are mentioned.

Keywords: *e-management system, e-resource, e-lecture, interactive training, higher education, social reading*

1. INTRODUCTION

The main objectives of the Azerbaijan Information Society include the creation of a legislative base for information and knowledge about the society, the development of the human factor, and to support the rights of citizens to receive, disseminate, and use of information. The objectives also include the formation of e-government and e-commerce, strengthening the economic, social, and intellectual potential of the country, as well as the establishment of a sustainable and knowledge-based economy, and enhancing the country's modern information and communication infrastructure. Doing so will include structuring a single national electronic information space, the introduction of e-management systems in the higher education system, improving the use of electronic resources, identifying the ways to provide teachers and students with employment and comfort, and implementing different social reading programs apart from traditional lectures in classrooms while providing for information security and the elimination of electron retention¹. The tendency of the society to embrace global informatization depends directly on the development of educational institutions. This requires the creation of an uninterrupted educational system that ensures that everyone will have access to a high quality fundamental education according to each person's desires and needs that is available anywhere and anytime. For this reason, the introduction of electronic education (e-learning) related technology is essential to establishing such an education system. E-learning technology provides the most effective tools for directing people to new types of education and to developing the skills and abilities needed for lifelong learning. E-education creates enormous opportunities for lifelong learning by building a bridge between labour and education.

2. CURRENT SITUATION

The ways in which people communicate has undoubtedly changed recently. Many people now use public networking that is conducted on Facebook and Twitter in the place of face-to-face dialogue, and phone conversations. There is no real difference between these types of communicate. For example, smart phones have become an integral part of student life that allows student to rapidly communicate with their friends and family. Currently, much progress has been made on improving the internet resources of Azerbaijan. This has increased the interest of pedagogical staff in using the internet as an education tool in both secondary and high schools. Higher educational institutes of Azerbaijan have been provided with computers and internet services. Ongoing analysis shows that these are being used efficiently for various types of courses. Today, teachers enthusiastically prepare lessons using e-resources in the e-management system. "State Strategy under Development of Education in the Azerbaijan Republic" was approved by an order dated October 24, 2013 of the President of the Azerbaijan Republic². It says: "The role of education the economy has significantly increased in modern life. Education must not only serve to teach required skills and knowledge related to economics but must also serve to prepare citizens for their future life and integration into society comprehensively. The most important role of education in economic life is to meet the educational requirements needed for the lives of human beings. Meanwhile, rapid innovations regularly require knowledge and skills to be refreshed. For this reason, skills and knowledge are required in order to master new smart technologies and relevant professions. Education plays an important role in the development of a knowledge-based economy. Today's information knowledge society creates a great opportunity to socialize individual knowledge via the internet environment. Azerbaijan has implemented many reforms in this direction. For this purpose, two documents have been approved namely the "Azerbaijan 2020: Look into the Future" Development Concept approved on December 29, 2012, by an order of the President of Azerbaijan³ and "Strategic Road Maps for the Perspectives of the National Economy" approved on December 6, 2016⁴ by the Republic of Azerbaijan. These state programs support the related sectors of the knowledge economy such as high quality education, effective fundamental science, knowledge production, high-end technologies, effective science such as technical venture business as well as the realization and transfer infrastructure of ideas. E-learning has been reflected by a number of documents approved for the development of the national educational system in Azerbaijan. Thus, the Law of the Republic of Azerbaijan No. 833-IIIQ dated June 19, 2009 was approved. Azerbaijan hosts more than 1 million internet users. Including 12% of the populations with a gender based breakdown of 69.9% male and 30.1% women. Those internet network users are group as follows: 36.4% at home, 23.0% in internet clubs, 19.8% at work, 14.9% at educational institutes, 2.1% in libraries, and 3.8% in other places. Research studies have revealed that one of the problems is the Azerbaijan doesn't have the Law on e-management systems.

3. PROBLEM AND OPPORTUNITIES

E-learning processes are complex at the higher educational institutions of Azerbaijan.

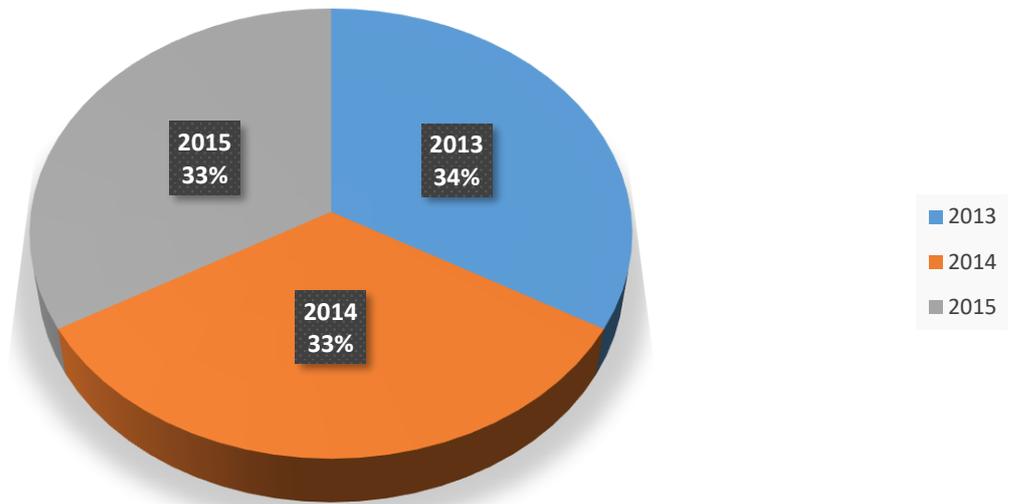

- There is no any state strategy for the development of e-learning in Azerbaijan.
- Uncertainty of assessment criteria for the evaluation of e-learning tools makes e-training realization processes complex.

Existing problems have been analyzed during the research activity, and some proposals have been put forward to eliminate such problems. 28 indicators of e-knowledge on Azerbaijan Information Society of State Statistics Committee have been analyzed. The sample of 2013-2015 years report is the proof of facts mentioned above.

Table 1: E-knowledge of information society group.

Indicator	2013	2014	2015
Distribution of Internet-related actions, % of total	100,0	100,0	100,0
Usage of search engines to find information %	17,7	17,3	17,5
Sending emails with attached files %	17,8	17,2	17,0
Communication in chat %	20,5	21,2	21,8
Usage of internet to make a call %	16,4	16,5	16,8
Usage of the same-level files for sharing movies, music, etc.	20,2	20,1	20,3
Creating a Web page (Web page, Website) %	6,9	6,8	6,6
Other activities %	0,4	0,5	0,4

Figure 1: Distribution of Internet-related actions, % of total

The main goal here is to introduce innovative technologies to create a transparent and effective educational environment, improve the quality of education, and raise university management to the level of modern requirements. We assume that as a result of the introduction of e-management systems in the university all stages of education will be informatized, transparency will be fully satisfied, and the quality of teaching will increase. We can set an example the results of the research for student's knowledge assessment done by the Azerbaijan State University of Economics through the e-management system. Teachers prefer to deliver lectures to students through e-system. However, the quality of lectures is not guaranteed. Social reading initiatives aren't preferred during lectures in the auditoriums. Besides, e-books aren't used. However, trainers who participate in collaboration with students can form a productive environment of social reading initiative for active learning. E-reading platform that enables social reading is not used. According to our researches, there is no any requirement to prepare lectures. It is one of the main problems. The application of Internet resources and technologies in the educational system will enable people to increase their knowledge and skills by using internet resources and social services not making any payment or leaving their places. The PRT colloquium (mini-conference) program at the Sidney University of Australia was implemented at STEM departments. Teachers exchanged their experiences with colleagues at the university. Observations were conducted by pedagogical and disciplinary experts⁶.

CONCEPTUAL BASIS OF ENTREPRENEURSHIP DEVELOPMENT IN NON-OIL SECTOR

Gabil Manafov

Azerbaijan State University of Economics (UNEC)
g.manafov @unec.edu.az

ABSTRACT

The evolution process of scientific views on entrepreneurship have been looked through the theoretical, conceptual aspect and leading force, strategic resource of entrepreneurial activity, especially small and medium-sized enterprises (SMEs), enabling the economic, technological and intellectual potential of our country have fully and effectively implemented through business activities and was emphasized in the article. For the determination of strategic goals such as sustainable growth of non-oil sector and high share of gross domestic product in the current period for overcoming oil dependence of our economy and to secure insurance against oil prices fluctuations in world markets, dynamism of entrepreneurial activity, importance of defining new tasks in relation to targets and stimulus, development of new conceptual bases of their implementation have been pointed out. From the conceptual point of view a great attention paid to the importance in the article to the "Strategic road map for the consumer goods production at small and medium entrepreneurship level in the Republic of Azerbaijan" approved by the President of the Republic of Azerbaijan on December 6, 2016. Taking into consideration the innovation-based development as one of the priority directions of SME development in the non-oil sector of the country by expanding opportunities for financing private innovation investments with legislative, organizational and economic measures implemented for the improvement of business environment. It is planned to work out the mechanism for solving investment problems, increase financial sustainability, expand access to long-term and low-interest loans, to provide concessional loans and insurance, loan repayment mechanisms, credit allocation and management for the simplification of the system has been justified as an important issues in the article.

Keywords: *non-oil sector, small and medium-sized business, innovation, state support mechanism*

1. INTRODUCTION

Nowadays, the development of entrepreneurship in the non-oil sector is put forward as an important strategic task which aims to reduce completely the dependence of Azerbaijan's economy on oil. The solution of this task is directly related to the improvement of the conceptual and legislative basis of entrepreneurship in the country, the continuous improvement of the business and competition environment, strengthening of the state support mechanism for entrepreneurship and it creates the suitable environment for expansion of diversification of economy and improvement of its structure, strengthening its innovative orientation, increasing its export potential, and creating new jobs.

2. THEORETICAL FOUNDATIONS OF ENTREPRENEURSHIP

Entrepreneurship is one of the main determinants of market economy as a special type of functional activity, which allows to realize the country's economic, technological and intellectual potential fully and effectively and to strengthen the economic power of the state. A term "entrepreneur" was introduced by the French economist Rishar Cantillon for the first time in western economic literature, who lived at the beginning of the 18th century based on the views of A.Smith, J.B.Say, W.Zombart, J.Schumpeter, A.Marshall, K.Marx, J.Keynes and

others, theoretical concepts on entrepreneurship has evolved and has passed below mentioned development stages: (1)

1. Entrepreneurship activity is directing the capital in the conditions of limited economic resources by the owner of capital to different areas for gaining profit. Representatives of this approach that identifies the capitalist and entrepreneur are R.Cantillon, A.Smith, W.Rosher, J.Turgot and others.
2. Entrepreneurship is a business activity related to the organization and management of production. In this training, capitalist and entrepreneurial concepts are distinguished from one another and the entrepreneur is treated as a manager, the content of entrepreneurial activity, its economic function is identifiable with an individual entrepreneur with certain economic qualities. These qualities include the followings: stubbornness toward the goal, readiness to take responsibility in uncertain situations; not to be confused in difficult situations; to take smart risks, to be confident in the started job etc. (representatives: A.Marshall, L. Walras, A.Cole, P. Drucker, D. McLelland and others).
3. Entrepreneurship is a business activity that is connected with risk, implemented in uncertain and information lacking condition. (Representatives: R. Cantillon, J. Thünen, F.Nayt, R.Coase, L.Mizes, F.Hayek and others).
4. Entrepreneurship is a business activity which is characterized by regular innovation, organizational innovation, and creates new economic conditions at the market. (Representatives: J. Schumpeter, P.Drucker, G.Schmoller and others).
5. Entrepreneurship is an activity that includes both economic and non-economic aspects, first and foremost social aspects (changes in demography, science, education, culture, etc.). (representatives: P.Drucker, R. Ronstadt, and others) (2).

A number of researchers of the entrepreneurship phenomenon draws attention to the fact that, along with its socio-economic aspect, it has a global universal character, which is now important for the economic progress of not only highly developed countries but also less developed countries. In this regard, J.A.Lewis is exploring the key role of entrepreneurship in order to provide the necessary economic growth in the "third world" countries, where population density is high, capital and natural resources are limited. He keeps the entrepreneur in the center of market-oriented economic reforms in such countries and considers it to be the main subject of rationalization of production. According to Lewis, a businessman working in a specific environment in these countries effectively distributes limited investments in various areas of economic activity, which ultimately leads to the growth of the national economy (3).

3. CURRENT STATE OF THE NON-OIL SECTOR IN AZERBAIJAN

It shows that entrepreneurial activity, which is a concrete manifestation of the economic relationships of the market system, is a dynamic process that always has new features and development trends. Especially in the second half of the last century both the socio-economic realities of developed countries and the tendencies of many emerging economies have further aggravated the entrepreneurial practice and contributed to the emergence of new domestic business forms and modern aspects and characteristics of inter country economic relations. As a result, new features are created essentially in development of business activity that have resulted in more enrichment of classical and neoclassical theories about entrepreneurship with new scientific concepts and exercises, and scientifically justification of new socio-economic realities, and their creative application in the formation and development of young national economies. In this regard, especially in the recent times organizational and economic characterized measures have been implemented for the formation and development of the competition based entrepreneurship. Continuous measures have been realized for developing the state-entrepreneurial relations, improving the state regulation system, business environment

legislation and administrative procedures, developing entrepreneurship across the country, improving the structure of enterprises and the mechanisms of state support to the entrepreneurs in Azerbaijan. As a result of economic reforms regarding the improvement of the entrepreneurship in the past period, now the private sector has more than 80% share of the GDP, and most of the employed people in the economy are concentrated in this sector. At the current stage of economic development of our country, in order to eliminate the dependence on the oil sector, the sustainable growth of the non-oil sector and ensuring its superior share in GDP, broadening its diversification, thus the strategic goals are suggested, such as ensuring reliable insurance of shocks related to the oil prices volatility in the world market, realizing the export potential of the country until the final point and its adaptation to the production of goods and services meeting the requirements of the world market, replacing imports with local production and developing domestic market, and bringing it to the production of goods and services meeting the requirements of the world market, replacing imports with local production and development of the domestic market, improving the field and regional structure of the economy, draw attention to the importance of the development of the entrepreneurial activity, primarily small and medium enterprises (SMEs), and the necessity of defining new tasks related its character, dynamism, directions, targets and incentives, and elaborating the necessity of developing new conceptual frameworks for their implementation. This is not accidental. Although the export potential of natural resources for the Republic of Azerbaijan is an indispensable advantage and opportunity, dependence on it is equally dangerous. World experience shows that in the economic fate of wealthy countries, the positive role of natural resources ("natural forces") such as, various metal ores, mineral fuels (oil, gas, and coal) and etc. has an observable importance. At the same time, comparative analysis of economic development and progress in recent years shows that the development of the economy only on the natural resources with high export potential, leads to serious and dangerous social and economic problems - serious deformations in the structure of the economy, inequality in economic growth, dependence of the economy on world market conditions, inequality in income, etc. Therefore, the development of the non-oil sector: non-oil industry, agriculture, tourism, transport, social infrastructure, etc., which can make a significant contribution to the reduction of the country's dependency on the export of natural resources, should be properly assessed considering the arguments and strategic objectives. For this purpose, the establishment of long-term development concepts, creation functioning and efficient economic mechanisms for its realization and establishment of economic policy regarding its implementation are of strategic importance. Analysis of actual materials shows that, as a result of the economic reforms in the non-oil sector in the country for the more rapid and competitive development than the oil sector, the potential opportunities has been increased, the new production areas has been established, the level of supply of non-oil products has been increased because of the domestic production of import-substituting products, export capacity has increased, the country's economy has been partly diversified. (Table 1) (4).

Table 1: Production of gross domestic product in oil and non-oil sectors

Indicators	Years				In 2017, compared to 2014, %
	2014	2015	2016	2017	
Gross Domestic Product	59014,1	54352,1	60425,2	70135,1	118,8
Oil sector	22824,9	16682,1	20449,4	26073,2	114,2
Non-oil sector	36189,2	37670,0	39975,8	44061,9	121,8

As it is seen from the table data, the growth rate of the value added in the non-oil sector in 2017 compared to 2014 was 21.8 percent, which means that it is respectively 3.0 and 7.6 percentage

points more than the GDP and oil sector figures. As a result, the share of non-oil sector in GDP increased by 1.5 percentage points, from 61.8 percent to 62.8 percent in the comparable period. In the non-oil sector of the country in 2017, 44.1 billion AZN value added was generated, which is 2.7 percent more than in 2016. The share of generated value added in the non-oil sector had 62.8 percent share in GDP. The non-oil sector has increased the generated value added in the country's economy in 2017 by 1.8 percentage points. In the non-oil sector the generated value's 9.0 percent or \$ 3.95 billion, is from agriculture, forestry and fishing, 7.0% or 3.1 billion, is from non-oil industry, 15.2% or 6.7 billion AZN, is from construction, 16.6% or 7.3 billion AZN, is from maintenance of trade and transport vehicles, 10.8% or 4.7 billion AZN, is from transportation and warehousing, by 3.7% or 1.6 billion AZN, is from accommodation of tourists and public catering, 2.6 percent or 1.1 billion AZN, is from information and communication, 26 percent or 11.5 billion, is from other fields, 9.1 percent or 4.1 billion AZN, is from net taxes on production and imports. During 2017, the 49.7% or 8.33 billion AZN of the investments invested to the fixed capital in the economy was directed to the non-oil sector. The 10.8% of the investments in fixed capital and 21.7 percent or 1.8 billion AZN of investments in non-oil sector, was used for the development of the non-oil industry. During the first ten months of 2018, the volume of investments into the non-oil sector increased by 16.7%, also the invested capital's volume in the non-oil sector increased by 18.2%.

4. CONCEPTS AND DIRECTIONS OF BUSINESS DEVELOPMENT IN THE NON-OIL SECTOR

The main priorities of the economic policy aimed at eliminating dependence of the Azerbaijan located in the South Caucasus in the basin of the Caspian Sea which is rich in oil and gas, on world market prices of oil and export of hydrocarbon resources and the development of the non-oil sector, are particularly highlighted by entrepreneurship, primarily SME stimulation. This is essential for sustainable socio-economic development of the country, diversification of the economy, development of its field, territory, technological structure, opening new jobs, and increasing export potential. In order to identify the future development goals and directions of SMEs in the non-oil sector in Azerbaijan and to ensure their realization, the President of the Republic of Azerbaijan issued a Decree Number 1138 dated December 6, 2016, road maps in 11 directions, in particular, "Strategic Roadmap for the Production of Consumer Goods at Small and Medium Enterprises in the Republic of Azerbaijan" is of great importance from conceptual point of view. (5) By paying special attention to bringing business environment and regulatory framework closer to the Small and Medium Business Roadmap, providing affordable and effective access to funding resources for SMEs, internationalization of SME activities and expanding access to foreign markets, preparing skilled workforce and developing skills on SME subjects, to increase quality product and service offers in the regional markets, to encourage innovations for increasing competitiveness on the SME subjects, as well as to enhance research and development activities in the mentioned fields, has been accepted as important targets. One of the priorities of the development of SMEs in the non-oil sector of the country is to ensure its innovation-based development in the modern world, in order to not to lag behind in the development process of the world countries and to increase the efficiency and competitiveness of the economy (6, p.369). In general, systematic measures on innovation development in developed countries are one of the important directions of the state's economic policy (7). Nowadays, the economists pointing to the need to expand innovation policy in Azerbaijan indicate that in the near future, national innovation policies in our country should be developed in close cooperation and dependence on functional innovation, coherent innovation and regional innovation policies, and it is advisable to develop specific areas and industries, in other words, concepts in specific directions (Reference: (8, p.92). It should be noted that the innovation characteristic of business activity was emphasized in the studies about classical

theories of entrepreneurship by J. Schumpeter, P. Drucker and others. According to the innovation theory created by Schumpeter, the entrepreneur should have the following three important features: to be innovative, to be able to predict, and to be creative. Entrepreneurship is related to the entrepreneur's ability to create a new product, to introduce a new way to produce product, to find a new market for the product, to find a new raw material or to find a new way of creating things and organizations. As a result, entrepreneurs are the ones who develop and apply innovations for the first time. "Innovation is a change regarding the use and consumption of new consumer goods, new production and transportation means, markets and organizational forms in industry" [9]. Peter Drucker's theory of entrepreneurship points out that innovations, resources and entrepreneurial behavior are the most important elements of entrepreneurial activity. According to Drucker, entrepreneurial activity is characterized by the ability of consumers to utilize resources or to increase the value of resources for consumers, to create new values, and to combine existing resources and materials into a new product. From here, one can conclude that according to Drucker, entrepreneurs are the ones who are always looking for changes and trying to respond to changes. In addition, entrepreneurial activity is characterized by a unique combination of innovation and resources, as innovation increases resource utilization opportunities and generates abundance of resources [10]. The experience of developed countries shows that the implementation of the development of the business system in the innovation spheres can be realized only by using the potential of small and medium-sized enterprises, which are capable of attracting private capital in the innovation sphere, implementing the direction of scientific and technical developments in the most important products and technologies, capable of adopting innovations and market them in a short time. [11, p.47]. According to researchers, innovation potential of small and medium-sized businesses is a collection of material, financial, intellectual, scientific-technical and other resources necessary for innovation activities [12, p. 25]. The innovation process is generally described as the creation, the wide distribution and application of products and technologies that are distinguished for their scientific and technological innovation and provide new public needs [13, p. 32]. Innovative development involves the acquisition of modern ICTs by enterprises and companies operating in the country, the production of competitive products and the expansion of export markets [14, p. 47]. Finally, providing the innovation characteristics of the activities of the SMEs is crucial for increasing the competitiveness of small and medium-sized enterprises and strengthening their place in the international markets where the globalization process is deepening and the dynamism of the international competition is strengthening. When determining competitiveness of businesses, i.e., the advantage of the economic subject over the other local and foreign businesses, indicators are examined such as their scientific research potential, economic capabilities and efficiency of the activity, the level of management arrangement, the ability to produce and sell any product in the required timeframe and volume characterized by the production and sales potential of the entity, the image of the entity, the financial position, the entity's strategy, the specialization of the labor resources, which their level are also identified, either directly or indirectly, by the nature and level of the entity's innovation activity (15, pp.35-36). The State Program for Industrial Development in the Republic of Azerbaijan for 2015-2020 has crucial conceptual character in terms of the importance of expanding innovation activities and innovation processes of entrepreneurs' subjects, primarily the SMEs in sustainable economic development of the country. The expansion of science-intensive and innovative production in the industry, transition from natural resources exporting to the innovation model of economic growth is one of the main goals (16). Techno parks, which are intended to be created in each region of the country, are of particular importance for the expansion of innovation processes of entrepreneurship, especially SMEs. Techno parks, which are widely used in supporting innovation processes of entrepreneurship in the world, support science-intensive entities to have

strong place in local and foreign markets by transferring advanced technologies created by new knowledge and inventions to the industry through the SMEs and new product release, and they play an important role in providing innovation-oriented entrepreneurs with all kinds of assistance such as organizational, logistical, informational, consulting, financial and etc. A number of purposeful measures have been taken by the state to stimulate the development of innovation processes by addressing the important role and importance of techno parks and such innovative structures in forming innovation processes and ensuring its dynamism in the non-oil sector. Specifically, tax legislation envisages tax exemption from income tax, profit tax, value-added tax, property tax and land tax for individuals and legal entities working in the industrial and technology parks as well as managing companies and operators of parks (17). At the same time, several innovative structures have been established in several regions, including the Sumgait Chemical Industry Park, Sumgait Technology Park, Balakhani Industrial Park, Mingachevir Industrial Park, Azersun Industrial Park, Neftchala Industrial District and others. Currently, the main task in this area is the creation of the necessary legislative, organizational, and business environment for their efficient activity. The above mentioned shows that important conceptual measures have been implemented in terms of accelerating the development of SMEs and expanding their innovative activities in the non-oil sector of our country. Currently, one of the main tasks in this area is to improve the mechanism of private investment financing. In recent years, a number of development institutions have been established in the country for this goal, and one of them is the National Fund for Entrepreneurship Support. (Currently the "Entrepreneurship Development Fund"). In total, 1896.2 million AZN were allocated from the state budget to the National Fund for Entrepreneurship Support in 2006-2007. Only in 2017, the Fund provided concessional loans amounted 20.2 million AZN to 1953 entrepreneurship subjects, and 6591 new jobs were created through these loans (18). In general, SMEs have 99% of the share of the 136,000 entrepreneurs using concessional loans until now. Currently, a number of international financial and credit institutions operating on other fields of Azerbaijan such as the World Bank, the International Monetary Fund, the European Bank for Reconstruction and Development, the Islamic Development Bank and others are closely involved in the development of the business sectors. It should be noted that, after gaining independence, 13.92 billion USD loan agreement was signed during 1994-2017 in our republic. In total, 11.52 billion USD or 82.6 percent of the loans from signed loan agreements were spent. (19, p.329). Now, in this area, working out a mechanism for solving the investment problems of SMEs totally, to increase their financial sustainability, to extend access to long-term and low interest loans, to provide concessional loans, to insure loans and to develop loan collateral mechanisms by advanced international experience, and the simplification of allocation and management system of attracted credit resources are among the most important issues.

5. CONCLUSION

In recent years, number of legislative documents has been adopted for the development of entrepreneurship in the non-oil sector of Azerbaijan, its competitiveness and export potential, the state support system for entrepreneurship has been constantly expanded. As a result, competition and business environment has been improved in the country, the share and role of the private sector in the economy significantly increased. In our opinion, along with positive results, further development of small and medium-sized businesses in the non-oil sector, requires first of all the following measures to strengthen the state support to them:

1. Enhancing the innovation orientation of SMEs, for this purpose, ensuring the widest distribution of techno-parks, business incubators, consulting services and other effective organizational structures which are widely used in the world practice, creating a mechanism for the rapid monitoring and realization of promising innovation ideas and projects;

2. Finding and applying effective ways of ensuring financial sustainability of SMEs and effective and rapid solution ways of investment problems, improving existing legislation in this area in the context of modern requirements.

UNEMPLOYMENT AND SOME ISSUES OF USE OF HUMAN CAPITAL

Rashad Muradov

Professor at Azerbaijan State University of Economics (UNEC)

Azerbaijan Republic

rashad_muradov@hotmail.com

ABSTRACT

To provide sustainability of economic reforms carried out in our country and transition to new economic development strategy, the president of Azerbaijan Republic approved a decree "National economy and main directions of the strategical road map for key sectors of the economy" the main target of which is to improve human capital. It is necessary to mention that human capital plays a decisive role in an increase of labour productivity, sustainable economic growth, increase in competition between manufacturing and service sectors and integration of country to global markets. To achieve this, it is required to raise quality of all levels of education, to provide constantivity of improvement of workers' skills and knowledges, to adapt the preparation of skilled personnel for market requirements, to stimulate investment of companies on the research and development departments and to use existing human resources effectively. The article is focused on the role of the improvement of human capital and its efficient usage on the development of the society as a whole and alteration of the all aspects of social life in the provision of the sustainability of economic reforms held within the country. In this context, author tried to display the indispensable contribution of the education to the improvement of human capital by briefly analyzing the changes in the phenomenon of unemployment.

Keywords: *educational unemployment, human capital, labor force, labour productivity, reforms, sustainable development, unemployment*

1. INTRODUCTION

In order to achieve the continuity of the economic reforms within the country and to provide the transition to the new economic development strategy, the President of the Republic of Azerbaijan has confirmed the «prior directions of the strategic roadmap of national economy and main sectors of economy» in his decree No.1897 of 16 March 2016. One of the main goals mentioned here is related to the development of human capital. In this document it is mentioned, as a reference to the foregoing issue, that «human capital plays a crucial role at increasing the labour productivity, sustainable economic growth, the level of competitiveness in the sectors of production and services, and in the integration of country to the global markets. To achieve these goals it is required to increase quality in all pillars of educational system, to ensure the continuity in the enhancement of workers' knowledge and skills through trainings, to adjust the process of generation of skilled workers according to the requirements of the labour market, to stimulate the firms to invest in the sphere of research and development, to provide an efficient use of existing human capital» (Prior directions of strategic roadmap of national economy and main sectors, 2016).

2. COMMON PROBLEMS OF USING HUMAN CAPITAL

As an economic concept, human capital comprises the total sum of the skills, knowledge, habit and motives concentrated in humans, e.g. measure of the human skills that may bring profits (Fisher, C., Dornbush, R., & Shmalenzi, R; 1993, pp.123-187). Knowledge, habits and skills of the humans are transformed into the capital when they have profitability through investments and bring revenue in the shape of high salary to its owner (Sitkina, L.G.; 2000, pp.16-35).

Because human capital forms with due investments to humans and expenses on searching information about education, training of personnel in production, health care, migration, prices and incomes occupy a special place among these investments. It is important to demonstrate that loss of workers' ability to work results in devaluation of investments made on their education, production possibilities of a company decreases; balance between the continuous production and its separate parts. It is no accident that William Petty who was the first to call active living force of humans as a main wealth of the nations, considered healthy workers as valuable ones. The idea that the total sum of humans' professional qualities is income generating human capital, was also coined by him; he popularized the issue of significance and efficiency of investments on human capital and emphasized the primary role of a state as main socioeconomic institution driving the reproduction of human capital. His successor, Adam Smith, once noted that greatness and glory of a state rests largely on how populous, cultivated and industrious the nation is. He also associated the health of people with geographical factors such as environment, location and quality of the soil (Smith, A., 1962, pp.93-97). The results of the research suggest, the role of the efficient use of human capital in the progress of society has changed completely. That is why the reveal of potential opportunities (physical and mental capabilities) each person has, is one of the substantial duties of every civil society. The reason is that employment has become one of the major global problems of the world for today. According to the latest data, from up to 3.7 billion labour forces existing today in the world, more than 189 million people (4,9%) is unemployed, and up to 25-30% are people who work on incomplete business days. According to the same data, there are huge number of unemployed persons even in the most developed countries of the world. Those include USA with 8149 thousand people (4556 thousand males and 3634 thousand females), Germany with 4388 thousand people (2551 thousand males and 1836 thousand females), Japan with 3130 thousand people (1920 thousand males and 1210 thousand females), Great Britain with 1361 thousand people (788 thousand males and 573 thousand females), Italy with 4647 thousand people (2096 thousand males and 2551 thousand females), Canada with 1234 thousand people (685 thousand males and 549 thousand females), France with 2727 thousand people (1327 thousand males and 1401 thousand females), Russia with 5675 thousand people (2075 thousand males and 2699 thousand females) being unemployed. According to the statistical data of 2015, there are 8336.9 thousand unemployed persons throughout Commonwealth of Independent States. Azerbaijan, Armenia, Belarus, Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan and Ukraine shared, accordingly, 243.7 thousand, 243.6 thousand, 297.9 thousand, 451.1 thousand, 192.2 thousand, 62.1 thousand, 4264 thousand, 241.2 thousand and 1654 thousand of them. Certainly, due to certain objective and subjective reasons, the number of the unemployed persons registered in CIS doesn't reflect the accurate number of unemployed persons, but is deemed sufficient for the comparison of the statistics through countries (<http://www.cisstat.com>). Unemployment is an unconditional and inevitable economic event for market economy regardless from its reasons. One should consider, among the other reasons, the effect of globalization on unemployment. This effect impacts economy in two ways: on one hand, by the means of unequal growth of the population; on another, through the use of capital-intensive technology that requires less amount of labour in the process. As is known, economic growth is closely linked with the problems of labour market. Despite the large quantities of recently created jobs, the situation with the plausibility of labour market of our country remains very critical. Reduction of unemployment rate of the country is one of the vital factors of efficient use of human capital. To enable this, the society should impose sufficient conditions to adapt paid workers to the constantly changing conjuncture of the market and take all the necessary measures for it. For example, training of skilled workers, constant rise of investments that bring about an increased qualification in human capital, creating new jobs, provision of better conditions for legal migration, taking up measures for prevention of restrictions of workers' rights, protecting the

rights of paid persons etc.

3. UNEMPLOYMENT AND CURSORY VIEW TO ITS MAIN COMPONENTS

According to the provisions of International Labour Organization, unemployment has 3 criteria that need to be fulfilled simultaneously. According to that provision, 16 year old persons are qualified as unemployed persons if they:

1. Do not have a job;
2. Have actively looked for work;
3. Are currently available for work (ILO, 1994).

Presently, there are several theories that reflect the phenomenon of unemployment and in these concepts representatives of many schools of economics deal with the analysis of reasons causing unemployment. For instance, the first explanation of the concept is encountered in T.Malthus' work called «An Essay on the Principle of Population» (1798) in the late XVIII century. He related the causes of unemployment with demographic factors. For Malthus, unemployment happens when natural growth excels growth of production. In turn, Karl Marx undertook a research in his famous work, «Capital» (second half of XIX century), where he re-examined Malthusian theory of unemployment and explained reasons behind unemployment through accumulation of capital and cyclical development of market economy in the framework of exponential growth of organic composition of capital. He concluded that in the capitalist mode of production, consistency between the demand for labour and its growth which are accompanied by internal mechanism of capitalist production results in the excessive number of population. When looking thoroughly to the essence of the problem, it becomes evident that here excess population, in fact, arises when «...the mass of the means of production consumed by it increase, but their value compared with their mass diminishes...» reflected at the general law of capitalist accumulation which states that relative diminution of variable part of the capital. K. Marx demonstrated that «...The labouring population therefore produces, along with the accumulation of capital produced by it, the means by which it itself made relatively superfluous, is turned into a relative surplus population; and it does this to an always increasing extent. This is a law of population peculiar to the capitalist mode of production» (Marx, K.;1969). Modern economists associate unemployment with high salaries, low demand for labour force and non-flexibility of labour market. By analyzing unemployment as the inalienable attribute of market economy, most of these economists tend to point to the appearance of «transformational (variable) unemployment», in modern economics, which embodies economic stagnation due to the enduring character of reforms, low indexes of official (statistical) unemployment, low levels of social security and growing tendencies of labour migration.

4. HUMAN AS AN OBJECT OF CAPITAL INVESTMENT

It is clear that human has been an object of capital investments in each economic system while comprising the primary factor of production. Capital investment in human is as beneficial and equals to the capital investment in any other factors. According to American economists, K. McConnell and S. Brue, investing in human capital means the growth of labor productivity of worker or any human activity that increases the qualifications and competence (McConnell, C., Brue, S., & Flynn, S.; 1993). When putting money for raising the quality of labour force (human capital), first and foremost, it is important to make sure how efficient these investments are compared to the investments in any other factors of production. Because labour force, as an element of human potential, which is a key component of productive forces, and an object of accumulation of capital, differs from other factors of production by its value, utility and obsolescence.

Here we face yet another type of obsolescence that is not accompanied by the drop in the productive forces, but the rise in the concentration of knowledge accumulated in the labour force, increased experience and habits. We know that the productivity of the worker is rising over time. The American economist E.Dennison, who examined the importance of the level of education of employees in the sphere of material production, has evidently proved it in his research. We may acknowledge it by looking through the following table which demonstrates the results of his foregoing research (see Table 1).

Table 1: Natural Development of Unemployment in the Period of Transition (Churkayev, E. 2006, p.203)

No	Factors of production	Share of various factors (by percentage)
1	Increased labour costs	32,0
2	Rise of labour productivity, including	68,0
	Technical progress	28,0
	Capital expenditures	12,0
	Education and vocational training	10,0
	Saving from the scale of production	7,0
	Improvement of resource allocation	5,0
	Legislative and institutional changes	6,0
	Total	100,0

It becomes clear that education is the third most important factor of labour productivity. It is also interesting that the number of unemployed people holding diplomas and high levels of education in the economies of transition is growing rapidly due to 2 reasons: on one hand, from the structural changes happened in the economy; on another hand, since the economic structure is blindfoldedly transformed into the areas in which capital is likely to generate more profits. It is worthy to mention that even though economic stagnation in real sector was persistent during the period of Soviets, there was a significant progress in the field of establishment of new institutions providing higher and specialized secondary education and the developing education system paved its way for directing investments to profitable areas. However, at the same time, the failure to create efficient educational bodies systematically, and lack of academic qualifications accompanied by same major subjects taught in educational institutions did not ensure the high quality of education. It is no accident that, as a result of changes in economic system, many people in Azerbaijan, as well as in all countries of CIS, joined the ranks unemployed persons during the period of transition despite having diplomas from institutions providing higher and specialized secondary education. That is why, unsurprisingly, some economists have come up with the idea to include the new type of unemployment along with existing kinds. This type of unemployment, in academic literature of economics, is called «educated unemployment». It occurs in the train of transition to market economy and is characterized by the following features:

1. The structure and quality of vocational education does not meet the requirements of the labor market;
2. There happens a cluster of non-employed graduates of general and vocational schools in labour market.

Since the education system is a subsystem of society, the demand for education is naturally divided into two parts: general and special (vocational) education. The former, determines the ability to live in society. The latter, in turn, is determined by the ability to earn a living wage through self-employment, hiring or entrepreneurship (Muradov, S. M., 2004).

Reforms in the sphere of employment carried out in the framework of transition to market economy have resulted in abolition of quotas for graduates in some fields. Those graduates who enter the labour market first time have remained with no social security as they lost their job guarantee. Furthermore, the system of central allocation of young employees with jobs does not exist anymore. On one hand, this may be viewed as a positive case (because young employees choose the job they want), while on another, according to the market principles, when there is a lack of vacant jobs it impedes the process of finding job for the young and, consequently, they join the ranks of unemployed people which is a negative outcome of that. In such a case, some of those young employees with technical education are being obliged to work in the commercial structures and shadow economy (informal sector). Other, strive for prestigious and high-paid jobs. We should bear in mind the fact that some employers consider this issue seriously when trying to solve the problem of increasing competitiveness through downsizing. In this case, society can, at best, order general requirements for the content of education with regard to the capacities and age of those trained by certain organizations. Certainly, organizations, entrepreneurs and individual employers who need experts can have an impact on raising the level of preparedness among potential employees while they are still in schools of higher and specialized secondary education (through the labour market mechanism). In that case, they will recruit those young cadres according to their own interests (Muradov, S. M., & Muradov, R. S; 2016). There is no doubt that younger people with higher education have the opportunity to get a job where they get higher wages. However, it seems to us that there is no much need to assume that investing in these areas in the future will be profitable, and that's not worth thinking about. Because when young people enter universities and vocational educational institutions individually, they do not know, in advance, the number of those who want to enter to one or another specialty at the same time. That is why they are not able to properly evaluate what they are going to achieve in the future by finding jobs in one or another profession (Population and Globalization, 2002). It is clear from the surveys and official statistics that in the years of independence, the number of persons unemployed, as mentioned in the state employment services, in our country was 28877 in 2015. 12113 of those unemployed are in Baku; 1499 are in Absheron; 1799 people are in Ganja-Gazakh; 803 people are in Shaki-Zagatala; 839 people are in Lankaran; 969 people are in Guba-Khachmaz; 7204 people are in Aran; 1543 are in Upper Garabagh; 1317 are in Kalbajar-Lachin; 791 of them fall to the Mountainous Shirvan economic region (SSCRA, 2007, pp. 79-81). All in all, in the years of independence, most of the difficulties in labour market were faced by socially least secured groups such as females, elderly people, young people, and graduates from higher and specialized secondary schools. Thus, the share of females, young people between 18-25, young people up to 18 and persons of pre-retirement age who received the status of unemployed was, 38.6%, 13.4%, 0.4%, 1.9-4%, respectively (Labour market, 2003, p. 136). As for the overall status of unemployed people who graduate from higher and specialized secondary schools, it can be clearly seen from Table 2 below (see Table 2). Analyzing data, it becomes straightforward that in the years 1992-2015, graduates of specialized secondary schools were making 13.4-30.7%, while graduates from institutions of general secondary education formed 15.8-41.3% and those having no secondary education constituted 1,0-7,2% of all unemployed people who received unemployed status in the state employment services of our republic. The share of those with higher education among unemployed males during the comparable time period was between 17.9-38.7%; the share of those with specialized secondary education oscillated between 18.3-42.7%; the share of those with general secondary education was 12.0-39.3%; while the specific weight of people with non-secondary education reached 1,1-4,5%; Among those unemployed females, these figures were between 9.7-23.8; 25.8-43.1; 20,6-24,9; 18.7-41.0 and 1.2-9.3%, respectively. It means that currently significant part of graduates from institutions of higher, specialized secondary and technical education in Azerbaijan Republic, as well as throughout whole CIS, are

unemployed due to the inconsistencies between professional qualification of population and the real demand for labour force in labour market.

Table 2: Persons with unemployed status by level of education in Azerbaijan Republic (at the end of the year; by percentage) (Labour market, 2016, p. 126).

Unemployed people by gender over years	Total	Including				
		Higher	Specialized secondary	Primary vocational	Secondary	Non-secondary
Total unemployed						
1992	100	16,7	34,8	-	41,3	7,2
1995	100	13,4	24,7	20,5	40,2	1,2
2000	100	27,2	33,9	-	34,2	4,7
2005	100	30,7	34,8	-	30,2	4,3
2010	100	42,8	35,5	12,8	7,6	1,3
2013	100	48,5	35,8	11,2	4,2	0,3
2015	100	55,6	33,1	8,2	2,9	0,2
Male						
1992	100	21,1	32,2	42,7	-	4,0
1995	100	17,9	23,4	18,3	39,3	1,1
2000	100	31,8	34,3	-	32,6	4,1
2005	100	38,7	31,2	-	26,0	4,1
2010	100	50,4	30,3	12,5	5,5	1,3
2013	100	56,3	29,6	11,1	2,7	0,3
2015	100	61,8	27,8	8,1	2,1	0,2
Female						
1992	100	14,1	36,4	-	40,2	9,3
1995	100	9,7	25,8	22,3	41,0	1,2
2000	100	23,8	33,5	-	37,7	5,0
2005	100	23,1	38,1	-	34,2	4,8
2010	100	33,1	42,2	13,3	10,3	1,1
2013	100	37,5	44,6	11,3	6,4	0,2
2015	100	37,5	44,6	11,3	6,4	0,2

Those people also include persons with different categories of disability, previously convicted persons and IDPs. It is also worthy to mention that the real number of unemployed people, in CIS countries, exceeds that of official statistics by state employment services as much as 2-3 times. That is largely because of the unwillingness of most of unemployed persons to get such a status due to many reasons (low pensions, delay of pension refunds, hardships with registration process, sophisticated character of changing the statuses of unemployed people). Nowadays, one of the most substantial social obligations of our country is to decrease the time needed for population of finding jobs. While the average duration of unemployment in our republic was 14.5 months in 2005, this figure increased significantly and amounted to 18.5 months in 2015, including 18.1 months for males and 18.8 months for females (see Table 2). Table 2 shows that the unemployment period is generally different for people with unemployed statuses, including males and females. The main point of concern here is that the share of unemployed among those who are unemployed between 6 months and 1 year, and over 1 year remains high among all unemployed population. So, in 1993 the share of people unemployed from 6 months to 1 year was 17.5%; In 1995 - 12.7%, in 2000 - 11.4%, in 2005 it was 21.9%, in 2015 this figure increased to 25%; The share of those who remained unemployed for more

than 1 year was 8.8; 39.7; 59.6%, 67.0%, respectively, and in 2015 it increased to 71%. The same situation as above is typical for the CIS countries as well. According to official statistical data, among people who applied for state employment services for jobs in 2015, 57% in Azerbaijan; in Armenia - 33%; in Belarus - 66%; in Kazakhstan - 82%; in Kyrgyzstan - 52%; in Moldova - 46%; in Russia - 31.2%; in Tajikistan - 25%; in Ukraine 63% were successfully employed (16). It should be noted here that, in recent years, more serious steps have been taken to reduce unemployment in the Republic of Azerbaijan compared to other CIS countries, and in the recent years of our independence (2005-2015), this process has begun giving particularly stronger impulse. As mentioned above, from October 2007 to the beginning of 2015, 496.5 thousand new workplaces were created in our country, of which 352.4 thousand, i.e. about 71%, were permanent jobs. Table 3 shows that because of measures undertaken in the country in recent years, the number of unemployed people decreased by 23.3% in 2005-2015 to 243.7 thousand from 317.8 thousand people, including decrease in the number of unemployed males by 40.6%, from 172.7 thousand to 102.6 thousand, and the number of unemployed females decreased by 26.2% to 191.1 thousand to 141.1 thousand people.

Table 3: Changes in population dynamics of economically active and economically non-active population at the age of 15 years and above (at the end of the year, thousand persons)(Child Labour in Azerbaijan, 2007, p.19).

Population statistics by gender	Economically active population		Including				Economically non-active population	
			Employed		Unemployed			
	2005 year	2015 year	2005 year	2015 year	2005 year	2015 year	2005 year	2015 year
Total	4380,1	4813,5	4062,3	4569,8	317,8	243,7	1930,6	1516,6
Male	2275,0	2492,1	2102,3	2389,5	172,7	102,6	677,0	569,0
Female	2021,3	2321,4	1830,2	2180,3	191,1	141,1	1253,6	947,6
Urban areas								
Total	2107,4	2450,1	1867,3	2301,0	240,1	149,1	1237,2	819,0
Male	1142,6	1274,1	1034,6	1209,9	108,0	64,1	432,4	352,2
Female	964,8	1176,0	832,7	1091,1	132,1	84,9	804,8	466,8
Rural areas								
Total	2188,9	2363,4	2065,2	2268,8	123,7	94,6	693,4	697,6
Male	1132,4	1218,0	1067,7	1179,6	64,7	38,4	244,6	216,8
Female	1056,5	1145,4	997,5	1089,2	59,7	56,2	488,8	480,8

Even though the share of females, in this period, among the unemployed population generally dropped from 60.1% to 57.8%, it went up from 55.0% to 56.9% in urban areas, and from 48.3% to 59% in rural areas. As one may see, it is related to the outcomes of the surveys conducted between population aging 15 years and older. There is a great difference between the population who received official status of unemployed and those who are, in fact, not employed. According to the ILO recommendations, the unemployment rate is calculated by multiplying the number of unemployed people by the number of economically active population (sum of those employed and unemployed) divided by 100. When calculating the level of unemployment based on statistical data and ILO recommendations, it becomes clear that in 2003, the unemployment rate in our republic was 1.45%, 1.3% for males and 1.6% for females; In 2005, these figures were up 1.4% at an accelerated rate; 1.3% and 1.65%, and in 2015, respectively, 5.1%; 4.1% and 6.1% respectively.

5. CONCLUSION

At present, as in the CIS as a whole, in the Republic of Azerbaijan, due to the nonconformance between the professional qualification of the population and the real demand for labour in the labour market, one part of those who completed higher and specialized secondary schools, as well as technical schools, as well as people with disabilities, previously convicted persons and refugees join the ranks of unemployed population. It should be noted here that since the number of people getting unemployed status from state employment services in the CIS does not reflect the reality, it would be better to divide the number of those employed in the economy by the number of labor resources to determine the level of unemployment in the country. According to official statistical data, the number of labor resources and persons engaged in the economy in 2003 was 4923,0 and 3972,6 thousand respectively, in 2005 - 5421,3 and 4062,3 thousand persons, in 2015 - 6335,9 and 4671,6 thousand people. In this case, in 2003, the employment rate in the country was 80.1% and the unemployment rate was 19.9%; In 2005, 75.0% and 25%, and in 2015, respectively, 73.7% and 26.3% respectively (<http://www.stat.gov.az/source/labour/>). It is clear from all these words that human capital currently existing in our country, including its urban and rural areas, is not fully utilized in terms of the interests of the society as a whole. Therefore, one of the major challenges is to prepare for state and governmental authorities scientifically justified suggestions based on evaluation of both unemployment and the reasons that cause it through rigorous research and analysis and to achieve to carry them out. This is a civil duty and an urgent mission of every economist of our country.

THE EFFECTIVE MANAGEMENT WAYS OF ECONOMIC STABILITY OF ENTERPRISES

Nazaraliyev Sadiq Binyamin Oqlu

*PhD in Economy, Assistant professor of department "Theoretical and practical economy"
at Azerbaijan State University of Economics (UNEC),
Azerbaijan, Istiqlaliyyat Str. 6, Baku, AZ-1001
naz-sad@rambler.ru*

ABSTRACT

Modern economic conditions of economic development make leadership sets of commercial enterprises to the small business sector, to go in search of new and innovative ways of their development. Often development entails not quite the expected consequences. The article addressed topical issues of effective management of small trade enterprises, as well as administrative decisions related to the competitiveness and distribution costs. The emphasis is on the importance of proper and timely development and management solutions that ensure sustainable functioning of trade enterprises in the future. It is proposed to consider the interaction of small companies with larger organizations designated probable variants of this kind of interaction. Reflected the possible background of government involvement in ensuring the promotion of economic stability of commercial enterprises.

Keywords: *economic stabilization, entrepreneurship, management, management solutions*

1. INTRODUCTION

In the last decade the economic condition of the majority of the enterprises is characterized by steady positive dynamics production and socio-economic indexes that creates prerequisites for ensuring food security of Azerbaijan. Most often problems of agricultural production are explained by adverse external conditions. Practice shows that 10% of trade enterprises in many regions of the country in a similar situation work steadily, quite often in the self-financing mode due to effective management of internal reserves of production. Optimum and effective use of resources in system of realization of economic targets is not less important for economic stability of production of the agro enterprises. Methods of ensuring economic stability of economic entities (through influence first of all of internal factors), a technique of its assessment demand further completion (on the basis of its separate components). Thus it is necessary to take into account to communication between operational and financial performance, and also extent of influence of each of them. Defining the mechanism of formation of economic stability of economic entities, it is necessary to consider a state and interaction of its various elements causing activity of trade enterprise. Differentiation of external and internal economic stability gives the chance to allocate organizational and economic making the mechanism of management (Form, 1998). In the conditions of market economy each agro enterprise independently realizes the principle of security with resources, is responsible for the actions and results (an organizational component). The complete characteristic of economic stability demands an assessment of financial, production and technological stability (an economic component). Elements of management of economic stability can act as making strategic and tactical management when performing functions of planning, the organization, motivation, control, the account, analysis and regulation of activity of the enterprise.

2. CHAPTER 1

In a general view, making a start from the majority of opinions, economic stability can be defined, how ensuring profitable activity of trade enterprise, due to increase of showiness of business management and use of its resources.

Today, in our opinion, there is no accurately designated and uniform mechanism which would provide to the enterprise effective tracking of own perspective development on the basis of adoption of reasonable administrative decisions. Complexity of the designated question consists not only in number of the elements forming it but also in specifics of interaction of each element with environment. Using elements of the factorial analysis it is possible to speak about some set of exogenous factors which, eventually, define the future of development of system of the organization; thus you shouldn't forget that each organization depends on those specifics of activity which she is engaged. Speaking about specifics of activity of the organizations of special attention business firms deserve, it, first of all, is caused not so much by a branch component, how many a demand as the absolute statistical majority of the existing enterprises or are trade, or anyway market result of the activity, whether regardless of that it is material (a production product), or non-material (services). Economic stability of trade enterprise can be defined including through competitiveness which can be expressed in absolute value as the relation of quality of the main business process to costs of its implementation. According to Alekseev K.V. opinion., there is such concept as “competitive advantage of the enterprise». This state which assumes steady position of the enterprise at which requirements and economic resources for current and mainly strategic completely at the expense of own means (Nedosekin, 2008). The competition as economic category - concept rather multiple-valued. It is impossible to characterize it any universal concept. In confirmation of these words, it is necessary to give some definitions of various researchers. The competition is both a way of managing, and such form of existence of the capital at which one individual capital competes to another. The competition - rivalry, competition between the producers acting in the market for the most favorable conditions of production and sale of goods for receiving on this basis of the greatest possible profit. At the same time the competition is a mechanism of regulation of proportions of a social production. Being Attribute of the market, the competition arises in the natural way from the market and at the same time serves as an indispensable condition of its existence and development (Albekov and Kushnarev, 2016). Adam Smith connected the competition with honest, without arrangement by the rivalry which is conducted between sellers (or buyers) for the most favorable terms of sale of goods. <The competition is aspiration as it is possible will satisfy to criteria to accesses to the rare benefits> better, - the American economist P. Hayne considers (Doroshenko, 2013). In a case when it is necessary to come to quantitative expression of quality of activity it is possible to use an indicator of commodity turnover of the organization for a certain period as commodity turnover is quantitative expression of a consumer response to set of the administrative decisions which are carried out by the management in the field of purchases and sale.

3. CHAPTER 2

Commodity turnover of trade enterprise is understood as the sum of sale of consumer goods to them for a certain period of time. Commodity turnover in system of indicators of development of trade enterprise plays rather ambiguous role. It expresses that, at the same time being the main estimating indicator of volume of activity of trade enterprise, it serves as the defining indicator of formation of expenses of resources and resource potential. As notes I.A. Blanc, at the same time, in the conditions of market economy, commodity turnover has the subordinated character in relation to profit of the enterprise from trade activity (Alekseev, 2005). However, for this purpose that to speak about stability of position of the organization it is necessary to support this indicator within the norm established concrete the organizations taking into account individual conditions. As one of basic values for definition of norm of this sort the level of sales volume, optimum for the company, which represents such quantity of the realized inventory items at which the level of cumulative expenses of their address doesn't exceed the maximum value of the revenue received from their realization can act.

Along with a popular belief in toughening of modern environmental conditions, there is an opinion what only with a stable growth of sales volume it is possible to reach a certain level of development of trade enterprise, but whether so it actually? Growth of sales volumes inevitably involves growth of changes of expenses which about the turn demand additional financial investments which are capable to create a gap in economic stability of the enterprise sooner or later (Liquor, 1993). In circulation of resources financial means which decrease are subject to the sharpest fluctuations deprives the enterprise of potential of investment influence and leads to its degradation. System crisis of the enterprises undermines their reproduction process as derivation of already poor money on service of economic activity and repayment of accounts payable imposes restrictions on modernization of the located funds. With increase of intensity of negative dynamics they remain without necessary financing that holds down development of the enterprises (Chuprv, 2007). Thus, it is possible to draw a conclusion that one of the most effective measures providing stability of functioning of the enterprise can lie in the plane a solution of the problem of optimization of level of commodity turnover of trade enterprise. The aspiration of the enterprise to growth can have a negative shade in the conditions of extreme degree of uncertainty of environmental conditions, however the problem can proceed and from within. The aspiration in itself to leadership in the market and to search of opportunities of expansion of coverage of influence can lead to inevitable crash more often, than it can seem at first sight. In trade branches the enterprises relating to a segment of small business which are considered the most subject to different crises. As it is noted, small business plays rather important role in formation stable market structures.

4. CHAPTER 3

Small business provides workplaces, thereby reduces unemployment rate, increases the competition, i.e. In other words carries out a number of the major social and economic tasks. Annually thousands of enterprises for all Russia appear and disappear, however it doesn't cause serious concern as doesn't lead to negative reactions of mass character as, for example, bankruptcy of the city-forming enterprise. This fact, nevertheless, doesn't beg importance of development of approaches to effective management of the such enterprises taking into account from specifics. Adoption of the administrative solution of the control of intensive growth of the main indicators of activity of the enterprise lying in the plane, demands high extent of understanding by the manager of those consequences to which the administrative mistake such can lead. In our opinion, the majority of the organizations experience difficulties with economic stability not thanks to environment at all, and owing to a chain of errors of internal character. As the most often found mistakes the following can be allocated:

- a lack of profile education at the person making the administrative decision;
- aspiration to maximize personal result, despite of consequences;
- lack of accurately formulated strategy of development of trade enterprise;
- inefficient credit policy;
- individual tendency of the manager to give preference to the analysis of especially external conditions of activity.

In most cases in practice it is observed that adoption of the administrative decision at trade enterprise, it is possible to characterize as reaction to any flowing influences or requirements. At the specified approach trade not in forces considerable increase of certain contradictions between own interests and changes happening in an external environment will be timely to provide the enterprises (for example, change of preferences of consumers, changes in pricing area, etc.). The reality shows that the anticipation is higher than the specified contradictions, and opportunity to predict managing directors of a measure, necessary for the enterprise, it is possible, for example, when using the technique of the rating assessment which is concerning

a condition of trade enterprise, and based on the most important factors of economic activity. In the conditions of uncertainty in order that the enterprise remained economically steady, it is necessary to operate on borders between a disorder and stability, based on actions for development and decision-making in the field of management. For more effective functioning and steady situation, it is necessary to focus attention to mastering new techniques, and increase of own skills in the field of adoption of administrative decisions. Therefore the enterprise will be able to estimate adequately the situation in the circumstances and to define the main directions of the solution of problematic issues which finally will be able to yield positive result. The decision formulated tasks can't be unambiguous, in view of complexity of a question and impossibility and comprehensive influence on this sector of economy, however the solution can be certainly found. For example, regarding mutually advantageous partnership of small enterprise with larger or within the state influence on developments of a segment of small business in case the state assumes a role of the accelerator of enterprise activity and the stabilizer of economy (Form, 1998). We will consider option of cooperation of small trade enterprise with larger. According to Vilensky A.V., the future of the Russian business including small business, directly is defined by opportunities of formation of close cooperation connections of the small and large enterprises. In this a case it is favorable to large manufacturing enterprise or network trade retailer to form communications with small enterprises of trade as steady network of this sort of the organizations will be pledge of successful marketing activity as providing a network of independent small enterprises necessary the range of goods will act as the guarantor of implementation of the plan for marketing activity and therefore pledge of achievement of planned indicators of profit. The small enterprise will be able to receive with guarantee goods of rather high quality with a guarantee of delivery precisely in the stipulated time that will also be a guarantee of stability of activity. In process interaction the large enterprise can stipulate volumes of deliveries for each participating enterprise, formulate rules of deliveries and service, to help with determination of optimum volume of deliveries proceeding from individual opportunities of small enterprise, to help ensuring its effective integration into regional market space. As an element of the practical proof of efficiency of measures such, it is possible to provide the School of Trade project which is organized and actively JSC METRO Cash and KERRI takes root in all territory of Russia. The company helps small trade enterprises to make business processes by more profitable, however, isn't engaged in strategic planning of activity of small enterprises and doesn't conduct consultation on questions of improvement of the purchasing sold activity of the enterprises or optimization of distribution costs. Further, through interaction of this sort it is possible to stabilize activity and to increase chances of long and economically stable existence for a set of the small enterprises functioning in the sphere of trade. But there is also other point of view. It consists in negative dependence of the enterprises from each other. The enterprise has to be independent an economic entity of economy. The classical enterprise - internally uniform and operated complete organization which is carrying out transformation of a resource to a product. In reality the independent independent enterprises very seldom meet. The supporter of this position Kleyner G. claims that the real enterprises in Russia aren't present more because small enterprises are "personal plots" of the directors or owners. The medium-sized and large enterprises lost property of concentrates of resources and turned into the amorphous structures consisting of a great number of the small legal entities who distributed among themselves financial, material and material, information and administrative streams. However, in our opinion, only the mutually advantageous partnership can become the factor defining economic stability. Interaction of small business with government institutions can be other option capable to stabilize and define activity of the enterprises in the field of commerce. In particular within realization of government purchases (Bukholkov, 2013).

5. CONCLUSION

Logistic transformation of regional system of government procurements is focused on realization of innovative potential of participants of government purchases, ensuring start of the mechanism of support of the enterprises of small and medium business, optimization of a trajectory of the movement of economic streams, reduction of time of a cycle of purchases, rationalization of joint costs of merchandising, increase access of small and medium business to participation in deliveries for the state needs, to allow not support this segment of the market, but will significantly increase competition level among its participants. Such interaction will regulate purchasing and marketing activity of the organizations of small business operating in the sphere of trade, helping to reach definiteness in activity that will render inevitable assistance to their economic stability (Guzhina, 2009). As the proof the changes made to the law "About contract system in the sphere of purchases of goods, works, services for ensuring the state and municipal needs" in the current year which concern still bigger transparency of interaction of the state and private business serve. Thus, ensuring economic stability of the enterprises process which is hardly possible for mastering to the enterprise in case it is considered as the closed system. Despite a huge number of internal tasks which inevitably face, accepting the administrative decision, productivity of activity in the long term in many respects depends on as far as it is possible to establish relations with external partners, to establish an effective exchange of knowledge, including in the field of innovations, to raise definiteness degree in the field of purchases and sale, as a result to reach optimization of level of expenses and to provide economic stability of the enterprise (Lapusta, 1998). The solution of the problems connected with business growth practically blindly, irrespectively real economic opportunities and the analysis of prospects, is possible only a case of finding of ways of effective interaction with the external partner.

ECONOMIC VALUE OF CO-PAYMENTS IN HEALTHCARE

ABSTRACT

The co-payment system has to overcome a variety of specific problems due to the nature of healthcare needs and the structure of the healthcare system. Cost sharing in health care cannot be considered as a unique positive mechanism, and especially as an alternative source of financing. Their inclusion requires detailed design state politics of group risk protection and the search for rational and most acceptable forms of co-payments.

Keywords: *co-insurance, co-payments in health care, cost sharing in health care, patient fees*

1. INTRODUCTION

In spite of the numerous attempts, it was not possible to reduce the growth of healthcare spending in different countries of the world. In contrast, costs are constantly rising. This is due to various factors: ageing of the population, early diagnosis of chronic diseases and their lifelong expensive treatment, the introduction of innovative technologies and medicines, etc. In addition, it has been revealed that in some cases the healthcare system itself and its funding model provoke the cost increase. For instance, payment mechanisms for healthcare workers are a fee-based method that creates "moral temptation" and "demand triggered by supply." The other side of the coin is the possibility of free of usage of medical facilities provided by the national healthcare system or by private organizations that are free at the time of receipt, causes excessive consumption. Thereby, on the one hand, all countries are trying to provide majority of the population with services, on the other hand, patients can apply for medical services over and over again, not having indication for it. This applies to the national healthcare system on the basis of both insurance premiums and taxes. The same problem can be faced in private insurance organizations where the patient pays for service long before receiving it. The system of patient participation in the payment of medical services was introduced especially to reduce unreasonable complaints.

2. COST-EFFECTIVENESS OF CO-PAYMENTS AND CO-PAYMENT POLICIES

2.1. Economic and social efficiency of co-payments

Co-payments occur in the following forms:

- co-payments of insurance premiums, implying a contribution paid by the employee in addition to the employer's contribution (co-insurance);
- co-payments of citizens that are paid while receiving medical care (in the form of a solid fee or payment for each service);
- Excess - subtracting a certain amount from all insurance payments;
- balance billing - an additional fee charged by the supplier in excess of what he receives from the third-party payer

It is worth mentioning that co-payments in healthcare are one of the most solidary and fair methods of attracting private funds after private insurance. In developing countries, informal payments are practiced, and also the level of direct payments at the time of the appeal is high. But in the case of developed countries, there is a national system that covers almost the entire population, informal payments are not widespread, and direct private services are considered as one of the most unfair and inefficient sources of financing, and co-payments with voluntary

health insurance (VHI) are basic forms of private payments in this group of countries. Initially it was considered that charging user fees would reduce the demand for unnecessary services and become additional income that can be used to expand the supply of medical services. The degree of successful solution of these two problems is determined by the degree of elasticity of demand. From a logical point of view, a decrease in demand makes it impossible to increase income. That is, if the increase in user fees reduces the intensity of medical services usage, it cannot increase total revenue. The income increase argument is based on the assumption that the demand for medical services is not elastic: if the prices for users are maintained at the proper level, the intensity of use of services will not decrease so much to neutralize the increase in income arising from the increase in user fees. However, is the co-payment policy effective from an economic point of view? Thereby, the economic analysis of CEPOS in Denmark estimated that the introduction of a co-payment of 127 DKK (17 euros) for visiting a doctor for every citizen over 16 years old with an annual limit of 1,712 DKK (230 euros) would save 2.3 billion DKK (€ 310 million), subject to lower demand by 10% [1]. However, considering partial participation in expenditures as an additional source of financing and as a mechanism to reduce the demand for medical services, it is also necessary to determine its impact on total health expenditures. It has been established that a decrease in the usage of medical services leads to the development of diseases, which are even more expensive to treat, or if an increase in payment pushes people to the wrong structure of using medical care, which can even exacerbate the situation. This is reflected in the Lexchin and Grootendorst review [2]. The cost-saving co-payments can be restrained by health care providers interested in the incentives that their patients have. So, in response to partial participation in the expenses of drugs, in some countries doctors increased the number of drugs prescribed in prescriptions. It is also possible to artificially stimulate the medical services usage by physicians of the category of patients that is not affected by co-payments [3, p. 41]. But when it comes to health, pursued policy criterion cannot be only savings. Therefore, numerous studies conducted in this direction. The first research in the realm of evaluating the cost-sharing effectiveness is the study on the subject that was conducted from 1974 to 1977 by RAND corporation. The results of the RAND experiment showed that the intensity of medical services usage (measured by parameters such as the probability of apply for medical care, stationary treatment, admission of patients, ambulatory visits) decreases as the population surcharge increases. However, the fact of reduced use of services by a number of indicators (such as admission to hospitals, antibiotics, primary care) suggests that cost sharing reduces the intensity of use of both effective and ineffective - or unsuitable - procedures. Moreover, cost sharing is also associated with worse results in terms of the overall health situation of the population according to a number of indicators. The results of the experiment give rise to serious doubts about the impact of cost sharing on macroefficiency (as opposed to microeconomic cost containment) [4, p. 182]. Later studies by analyzing relevant literature published between January 1990 and December 2011 emphasized that the vast majority of studies showed that co-payments reduced the number of services required, including the number of visits to general practitioners and the use of prophylactic services [5]. A decrease was also noted with the use of pharmaceutical preparations, even when co-payment is small [6]. At the same time, payments for drugs reduced the use of both necessary and unnecessary drugs, since information asymmetry does not allow people to make the right choice [7]. It should not be forgotten that in addition to these costs, many people face additional direct and indirect costs: re-consultation, which also requires additional payments, loss of income during treatment, or additional costs for childcare. Even a minor problem of parking, also represents a barrier for people to access medical care. Thereby, a survey of people, implying an answer to the question "Did parking expenses influenced their overall health care costs?" revealed the following. 23% missed an appointment with the doctor, while 9% left without medication because of payment for parking, 10% changed the doctor or hospital, 71%

saved on other household items to afford parking [8, p. 23-27]. There are a large number of studies about equity in obtaining medical care while cost sharing. It has been established that although the introduction of co-payments hinders the use of medical services in all the criteria of the population, it has a much stronger effect on the poor. Fixed co-payments make up a large part of the income of people with lower incomes than the wealthy. So they tend to be less fair than other forms of state financing of healthcare and consequently, reduce the overall equity of the country's healthcare system [8, p. ten]. It was established by Pulson that co-payments can lead to increased inequality. A research based on the 2009 EU SILC survey found that there is a link between surcharge and unmet health needs. 24.9% of participants indicated financial reasons as the main factors for their unmet medical needs, which put them at risk of poor health in the long run and create inequality [9]. Due to the nature of the health needs and the structure of the health care system, the co-payment system will have to overcome a number of specific problems.

- Uneven demand for population. At the same time talking about the average for a particular person is somewhat incorrect.
- Unpredictability. The loss of human health is not controlled. This hinders the budget for possible health care costs.
- Financial burden on the poor and dejected burden of the disease. The introduction of co-payments leads to a situation where healthy and rich people will pay much less for their health than the sick and the poor.
- Uneven demand for life: health needs vary greatly throughout life. People tend to use the medical care when they are very young, very old and (for women) during pregnancy and childbirth.

2.2. Co-payment policies

The policy on introducing co-payments includes the following directions.

2.2.1. Mechanisms to protect the financial interests of citizens or households

To protect the more vulnerable population in most countries, the elderly, people with certain chronic diseases, and low-income families are fully or partially exempted from co-payments. In Japan, people who were completely exempted from co-payments made up 1.7% of the total population in 2014 [10]. Such policies may protect vulnerable groups from costs associated with illness and disability (for example, in the mid-1990s in the UK, 84% of pharmaceutical prescriptions were written to those eligible for exemption from expenses), but it inevitably complicates the management of the cost-sharing scheme and increases administrative costs. However, most people in relative or absolute poverty did not receive social security: some did not meet the eligibility criteria; however, many others did not decide to get it because of social stigma or feelings of shame [11, p. 39]. Another mechanism is a reimbursement system for medical payments that exceed the established monthly limit. For example, in Japan, since 2015, patients should not pay more than 57,600 yen (about \$ 550) per month from their own pockets if their household income is below 3.7 million yen (about \$ 35,500) [10].

2.2.2. Choosing the right priorities in determining the services in relation to which co-payments are introduced

Comparative analysis for different countries leads to the following results. The main area of cost sharing is medicines and dental services. In the case of medicines intended for the treatment of life-threatening diseases or having a particularly strong therapeutic effect, the user share is usually less high than in the case of medicines with less effect on the patient's quality of life. Thereby, the result of a special and inconsistent approach to co-payments is that some people receive almost all of their medical care for free, while others, who may have more serious or

longer cases, face serious costs for their treatment. For instance, someone has an operation which is fully paid, and another has a genetic disease but should pay a co-payment, and he will be ill and treated for life. This leads to an unfair distribution of health resources [8, p 6)]. However, user payments can facilitate access to a doctor during off-hours or by appointment. Although it should be mentioned that in different countries patient participation is set differently: the rate of co-insurance in Germany ranges from 5 to 10 percent, while in France from 30 to 40 percent. In Japan, which is known worldwide for its universal coverage of health services, which has long provided equitable access to healthcare for all patients under the age of 70, they have to pay 30% of the total cost of medical care - regardless of their income - as a co-payment each time they see a primary care doctor [12]. The same surcharge applies to ambulatory and stationary care, prescriptions, diagnostic tests and surgery. According to some authors, joint participation of citizens implies the introduction of additional payments for the entire array of medical care, as well as the establishment of limits for co-payments for a number of patients (chronic patients, cases with long-term illness).

2.2.3. The choice of co-payments type

So, co-insurance creates more incentives to reduce the use of medical services, but, along with this, it carries a greater degree of financial risk, because the patient initially does not know the cost of the treatment, and, accordingly, the part that he has to pay. At the same time, insurance premium co-payments better ensure the principle of social justice, since both sick and healthy people participate in the process. On the other hand, deductible franchises lose in terms of equality, because create real problems for the treatment of low-income, and, as a rule, potentially sick categories of the population. It should also not be forgotten that the introduction of a system of co-payments can be accompanied by huge administrative information, economic, political and time costs. In order for user fees to be effective, you need to ensure that the cost of charging fees is lower than the additional income.

2.2.4. Optimal economic efficiency

Thereby, in 1999, the Netherlands abandoned the cost-sharing system introduced in 1997 due to the high administrative costs associated with the implementation of the new policy [13]. Another example of unsuccessful policy is the Czech Republic, where the introduction of co-payments of insurance in the absence of incentives to contain costs for both the provider and the patient led to the opposite result and doubled the cost of health care during the first two years of health insurance [14, p. 1872].

2.2.5. Many researchers believe that for a normal perception, the policy on the introduction of co-payments should be consistent with all subjects

It should prepare them for this step, work out the necessary priorities. For instance, a survey, a research conducted in Poland, revealed unreadiness to introduce co-payments, despite a general dissatisfaction with the quality and availability of medical services. Moreover, young people in good health, who live in big cities, have higher education and define their financial situation as good, spoke in favor of participation. However, loyalty was revealed in relation to some services that were considered possible on co-payment terms: payment for a family doctor or specialist home visit, surgical procedures and complex tests conducted during hospital stay (including computed tomography, magnetic resonance imaging) [15]. A research in Denmark regarding the introduction of co-payments to a family doctor's appointment identified four participants who are important for potential implementation. The Danish Parliament was in favor of the introduction and has great power. The general population and general practitioners have a negative attitude towards co-payments, while the Danish media mainly publish negative

stories about them. Thereby, the result of the research was that the introduction of co-payments for this service is not entirely desirable, although close countries actively practice it [16].

A special place is occupied by doctors of primary healthcare. They may be the first to notice that the patient's financial burden prevents them from receiving the necessary medical care. Thus, the prospects of primary health care physicians and attitudes towards the care of low-income patients play an crucial role in alleviating inequalities in the use of medical services related to economic status [11, p. 39]. A study conducted by Inoue Kachi in particularly disadvantaged areas in Tokyo, revealed that about 90% of the interviewed doctors had experience of observing patients with a financial burden; they have made efforts to meet the expectations of patients, somehow reducing this burden in relation to the medical care they provided [17]. At the same time, most of the participants stated that they are trying to reduce the burden on patients by making the consultation interval longer and choosing cheaper medications [11]. However, about 62% of participants agreed that it is necessary to reduce out-of-pocket payments for low-income patients. Respondents recognized the relationship between financial burden and patient behavior, as well as the importance of ensuring equal access to healthcare. The second group (21%) did not agree with the need to reduce payments from one's own pocket. These doctors believed that all patients should have an equal burden when receiving medical care, and that lowering payments for low-income patients would lead to inequalities regarding this burden. They also suggested that co-payments motivate patients to become more responsible for their physical condition and improve their lifestyle, for example, when smoking and drinking alcohol, especially among people with low incomes. Some doctors believed that there was no need or merit in reducing surcharges: they noted that various measures already exist to alleviate the financial burden for patients with intractable diseases and that the use of existing measures was sufficient; the introduction of new measures was unnecessary. The third group of participants (17%) believe that the adoption of legislation to reduce fees for low-income patients will cause a number of problems. First of all, these doctors were concerned that any alleviation measures for low-income patients would be impractical due to the tight financial resources of the Japanese government; doctors believed that such measures would lead to financial strain and dilemma in the treatment of such patients. Doctors in this group have proposed alternative measures, such as limiting co-payments in relation to specific diseases and costly forms of treatment. For instance, expensive diabetes medications, including insulin, will be particularly problematic in the event of inadequate access. The potential risk of overuse of medical care was another problem: some doctors believed that in all cases free help should be avoided; they mentioned the current issue of over-utilization of medical services by social protection patients who receive free assistance [11, p. 41]. Thereby, in the decision on the need to reduce co-payments for vulnerable groups of the population, about 40% of doctors were against it.

3. RESULTS

1. Co-payments in developed countries are used not so much to attract additional funds, but to rationalize the funds used, as well as to reduce cases of unfair treatment
2. The introduction of co-payments leads to a decrease in the intensity of medical services usage. At the same time, there is a decrease in demand, both for unnecessary and necessary services, and reduces access to medical services, especially in risk groups. Particularly depressing is the fact that it concerns primary and prophylactic care. All these facts adversely affects the health of the population. In addition, we are faced with a dilemma: on the one hand, co-payments are introduced for the working population. On the other hand, those people who have a job spend less time on treatment, moreover, less abuse of treatment

3. User charges should not be considered as an alternative source of funding along with taxation and social insurance, because the share of health care revenues attributable to co-payments rarely amounts to 20% of the total income. At the same time, we should not forget about the huge administrative and temporary costs.
4. Considering co-payments as an additional source of financing and as a mechanism to reduce the demand for medical services, it also should be considered that cost sharing may also lead to actually increase the cost of medical care in general.
5. Cost sharing contributes to the violation of the principle of social justice and serious financial problems. A situation arises when those who need treatment and support pay more for their health. Moreover, the same service makes up a different share according to the income, which exacerbates inequality.
6. The financial participation of patients makes them more prudent in their health and actions of doctors.
7. Therefore, introducing cost-sharing requires a seriously developed government policy that requires balancing co-payments between individuals with different financial levels and health needs, which includes: mechanisms to protect the financial interests of citizens or households, choosing the right priorities in determining services with a partial payment, choosing the right form of co-payments, involving all actors and taking their opinions into account in the development of public policy, and also the features of co-payments related to the nature of the needs and structure of the health care system.

OPTIMIZATION OF QUALITY MANAGEMENT OF CARGO TRANSPORTATION

Sevinc M. Abdullayeva

Azerbaijan State University of Economics – UNEC, Azerbaijan
sevinc120483@gmail.com

ABSTRACT

The method of calculation of basic parameters of cargo transportation has been analyzed. An optimal model of quality management has been developed. An equation of full economic costs has been formed for the logistics chain. The possibilities of carrying out optimal management of cargo transportation have been studied. It was determined that optimization parameters such as the capacity of the warehouse, the transport capacity of the vehicle, the efficiency of lifting vehicles can be taken. The main parameter of the logistics chain is justification for the minimization of the cost of economic integration costs. The issue of improving the production structure of transport enterprises has been solved to optimize quality management. It has been shown that the range of technical means that provide freight traffic is dynamic interacting and has a certain hierarchical structure. The system approach has confirmed that the system has an invariant structure. It has been established that optimization of the logistics chain must first be achieved by optimizing its structure, ie proportional development of its elements, rational union, and perfect harmonization of key parameters. It has been established that the multidimensionality and diversity of indicators and parameters characterizing the work of technical facilities make it difficult to select effective methods and tools for their calculation. It has been shown that the methodological basis of the optimization of the quality of transportations can be generated by the use of production power, which is an integral indicator of the potential for load capacity over a single period of time.

Keywords: *economic cost, logistics, management, quality, transportation*

1. INTRODUCTION

Resulting from the socio-economic needs of modern society organic integration of transport with production and consumption has led to the conversion of transport into a indivisible unit of the integrated "production-transport-distribution" system {1}. In the open market and the decentralized management of production, transportation and distribution of goods, this system consists of a set of horizontally interconnected objects {2}. From this point of view, the object of optimization is a combination of all technical means involved in the delivery process of cargoes and realizing the objectives of logistics on the basis of relevant technological processes and operations. Investigate the simplest logistics chain. Let's propose that the gravel is delivered from the production site to the consumer point. The commodity producer is Khanbulakchay gravel plant, the consumer of the product (cargo) Akkord OJSC. The amount of gravel ordered to be delivered within 100 days is 5,000 tons. First of all, characterize the requirements for safe delivery, protection and storage of material flow and cargo. The crushed stone belongs to bulk cargoes, transported by open vehicles and stored in open warehouses. There is no need for additional measures to exclude damage of cargo during its loading to vessels, wagons and cars. We suppose the hourly productivity is 70t per hour for loading and 58t per hour for unloading. Let's characterize the technology of gravel transportation and the route of movement from the production site to the consumer site. Let's assume that the gravel plant has a railroad on a freight yard. The first operation here is the loading of the crushed stone from the consumer's open warehouse to wagons with the help of a conveyor belt. Let's say that the railcars full of gravel are transported by rail to Lankaran station and further to the existing railway line. The gravel is unloaded at the open warehouse in the port.

Gravel is stored in the warehouse until the ships are loaded. The gravel is loaded to ships and shipped to Baku. Let us suppose that the length of the waterway is 413 km. A gravel is emptied by floating crane to an open warehouse in Baku Alat Sea Port. The gravel is transported to the consumer's warehouse by dump trucks.

2. CHAPTER 1

The required logistic operations, tools and their parameters are presented in Table 1.

Table 1: Required logistics operations, tools and their parameters

Operations	Tools	Parameters
Storage at the production site	Open storehouse	Capacity, t
Loading	Conveyor transporter	Loading capacity, t
Railway transportation	Flatcar	Productivity, t/hour
Unloading at the port's warehouse	Greifer harbor crane	Productivity, t/hour
Storage at the port's warehouse	Open warehouse	Capacity, t
Loading to ships	Greifer harbor crane	Productivity, t/hour
Railway transportation	Dry cargo ship	Loading capacity, t
Unloading	Greifer floating crane	Productivity, t/hour
Storage	Open warehouse	Capacity, t
Loading to dump truck	Excavator crane	Productivity, t/hour
Transportation by truck	Dump truck	Loading capacity, t

Thus, delivery of crushed stone consists of four operations: storage, loading, transportation and unloading {3}. The following equipment is used to carry out these operations: open warehouse, conveyor transporter, harbor crane, floating crane, excavator crane, flat railcar, dry cargo tanks, dump truck. The following optimization parameters could be taken: the capacity of the warehouse, the loading capacity of the vehicles (railcar, ship, truck, etc.), the productivity (or loading capacity) of lifting vehicles and so on.

3. CHAPTER 2

Basic methods of parameters' calculation. All economic costs or integrated costs can be taken as the key parameters of the logistics chain (load capacity Q , t, productivity P , t/hr, capacity E ,t) optimization criteria. Integral costs Z - both current costs E and unused capabilities of the specific capital. Integrated costs are as follows:

$$Z = E + k\rho/100 , \quad (1)$$

Where K - the equity used, man;
 ρ - average rate of return of capital, %.

Specific economic expenses of a single transport product Z can be found as follows:

$$Z = S + k\rho/100 , \quad (2)$$

where S is the cost of transport product, man / ton (man / tkm);
 K - special capital ratio of transport product falling on special capital, man / ton (man / tkm).

Let's formulate the equation of full economic costs for the logistics chain described above:

$$Z = Z_1 + Z_2 + Z_3 + Z_4,$$

here, - full economic costs in the transportation, loading, unloading and storage operations, respectively.

It should be noted that the parameters of the automobile and railway transport technics are determined by the type of load. However, we have to look at the full economic costs of transporting cargoes on the railroad. In this case, we can define the integral costs of shipping a G ship with a ship:

$$\begin{aligned} Z &= Z_{don} \cdot t_d + Z_{yük} \cdot t_{yük} + Z_{boş} \cdot t_{boş} + Z_{sax} \cdot t_{sax} \\ &= Z_q \cdot t_q + Z_d \cdot t_d + Z_i \cdot t_i + Z_{b.d.} \cdot t_{b.d.} + Z_{sax} \cdot t_{sax}. \end{aligned} \quad (3)$$

where - $Z_{don}, Z_{yük}, Z_{boş}, Z_{sax}$ economic costs, man/hour, in transportation, loading, unloading and storage accordingly;

Z_q, Z_{bd} - economic expenses, man / hour, during departure and leisure according to the fleet;

Z_i, Z_{bd} - economic expenses, man / hour, for keeping the mechanisms in operation and during idle time;

t_d, t_u, t_b, t_{sax} transportation, loading, unloading and storage period, hours;

t_i, t_{bd} - the time during which the mechanisms for the handling of a ship's (one train) burden are at work and vacancy.

We can write based on obvious dependencies without having detailed technical and technological operations:

$$\begin{aligned} t_q &= l/U, \\ t_i &= t_d = G/P, \\ t_{bd} &= 24G/G_{gün} - G/P, \\ t_{sax} &= 24G/G_{gün}. \end{aligned}$$

The latter seems to be that the logging operation, such as the load storage parameters, is tightly closed with the load parameter $Q = G/P$, ie the capacity of the warehouse is $E = f(Q)$ and can be removed from the range of the inputs. Then this equation looks as follows:

$$\begin{aligned} Z &= Z_q l/U + (Z_d + Z_i) \sum G/P + Z_d \sum \\ &(24G/G_{gün} - G/P) + Z_{sax} \cdot 24G/P \end{aligned} \quad (4)$$

Here, l - length of sea transportation route, km;

U - speed of the vessel, km / h;

P - productivity of cargo works, t / h;

$G_{gin} = G_y / t_{i.d.}$ daily load input, t / hr; here $t_{id} - G_y$ is the business cycle of the fleet to deliver a thousand tons of cargo, hours.

For similar calculations, the speed of the ship (train) can be expressed by the following empirical dependence:

$$U = a \cdot Q^b \quad (5)$$

It is logical to assume that mechanization costs may be proportionate to the productivity of those vehicles,

$$Z_i = Z_i \cdot P, \quad Z_{bd} = Z_{bd} \cdot P,$$

Here, Z_i, Z_{bd} - are special costs for mechanization, man.

It is necessary to take into account the scale effect of the fleet maintenance costs (the lower the cost per ton, the greater the load capacity), ie:

$$Z = Z_0 \left(\frac{Q}{Q_0} \right)^d, \quad (6)$$

here Q_0, Z_0 - the ability to ship, tone, and a selected vessel (train) - current costs for maintaining the prototype, t / h.

Cost of storage can be found as follows:

$$Z_{sax} = Z_{sax} \cdot G_{sax}.$$

Let us assume that the maximum amount of cargo storage at the port of departure is $G_{max} = G$, at the destination port is $G_{max} = G_h (1 - t_e / T)$. In this case, the average storage capacity of ships can be found in the range of ships:

$$G_{sax} = G \left[1 - t_e / T - G_{gin} / (24P) \right] / 2.$$

Go to the definition of special expenses. (5) by dividing the equation on the ship (train) by the amount of load $G = \rho'Q$ and making certain transformation:

$$\begin{aligned} Z &= A / Q^{l+b+d} + BQ^d / P + CP + FQ / P + H, & (7) \\ F &= Z_{xo} l / (\rho' a Q_0); \\ B &= Z_{do} (1 + k) / Q_o^d; \\ C &= 24 \sum Z_{bd} / G_{gin}; \\ D &= 24 \rho' \left[Z_{sax(yük)} / 2 + Z_{sax(boş)} (1 - t_e / (2T)) \right] G_{gin}; \end{aligned}$$

$$F = Z_{sax(bos)} \rho' / 2$$

$$H = \sum (Z_i - Z_{bd})'$$

where K is a coefficient characterizing the ratio of productivity in load handling and loading, ($K \leq 1$).

Thus, we have acquired a two-dimensional equation that can be easily solved by the numerical methods of optimization, for example, the Huk-Chiv method. Let's clarify the example we are looking at. The full cost of the ship's fare on departure is $Z_{do} = 310 \text{ man / ton}$, and when it stops is $Z_{do} = 150 \text{ man / ton}$. Special expenses in the discharge port are $Z_i = 1,5 \text{ man / ton}$, $Z_{bd} = 1 \text{ man / ton}$, in storage is $Z_{sax} = 1,0 \text{ man / ton}$. Take the shipping ratios $\rho' = 1; K = 0,8$. Note that the load is consumed within 5 months (summer-autumn), ie $T = 153$ days. It is required to substantiate the loading and unloading of mechanization facilities at the discharge point. On the basis of processing of numerous data on dry cargo ships and trains, we accept $a = 5$, downwards $a = 3$, and for trains 3 and 2, for downhill mileage. We must take into account that the speed of the load lane is 12% -20% during the free movement. We accept empirical coefficients $b = 0,2, d = 0,5$.

Then,

$$A = 310 \cdot 413 / 1 \cdot 3 \cdot 1500^{0,5} = 1102 ,$$

$$B = 150(1 + 0,8) / 1500^{0,5} = 7 ,$$

$$C = 24 \cdot 0,1 \cdot (1 - 100) / (2 \cdot 153) (100 / 50000) = 3,23 \cdot 10^{-3} ,$$

$$F = 0,1 \cdot 1 / 2 = 0,05 ,$$

$$H = 1,5 - 1 = 0,5 .$$

Numerically can be summarized as follows:

$$Z = 1102 / Q^{0,7} + 7 \cdot Q^{0,5} / \rho + 0,048 P + 3,23 \cdot 10^{-3} Q - 0,05 Q / P + 0,05;$$

After calculations we've got:

$$Q_{opt} = 1177t,$$

$$P_{opt} = 61t / saat$$

Special charges for the delivery of water by way of water will be 18mt / ton, taking into account the costs of mechanization and load maintenance at the discharge point. The equation can also be obtained sequentially with the help of individual derivatives, that is, the price of one of the variables. For this purpose, the productivity of mechanization at the level of the ship-hour norm is $P = B_{yik}$ and after a number of simplifications we will have an unbalanced equation:

$$Z = A / Q^{1+b+d} + BQ / B_{yik} / DQ - FQ / B + 6. \quad (8)$$

The optimum value of loading capacity Q can be easily reached by classic method as follows:

$$Q_{opt} = \left[(1+b+d) \cdot A \cdot B_{yik} / (dB) \right]^{1/(1+b)} .$$

After certain transformations we will get:

$$Q_{opt} = \left(K_3 \frac{Z_x B_{yük} l}{Z_{bd} a \cdot \rho'} \right)^{1/(l+b)}, \quad (9)$$

where K_3 is an empirical coefficient. For indirectly stored loads it is 0.2; $K_3 = 0.3$ for open loads.

The optimal loading capacity of sea transport for gravel transportation can be found as follows:

$$Q_{opt} = \left[(0,3 \cdot 310 \cdot 58 \cdot 413 / (150 \cdot 3 \cdot 1)) \right]^{1/1,2} = 1200t .$$

Find the characteristic of the ship to carry gravel from the book of inquiry. We choose a 942 project cargo carrier (barge or tanker etc.) with a load of 1000t.

We accept that the gravel emptying capacity is $1.6 m^3$ and 5t gravity floating cranes are used. In the loading and unloading work, productivity is defined in accordance with complex mechanization and time norms:

$$P_{kom} = (588 + 286) / 2 = 437t / növb .$$

This figure corresponds to the accepted productivity (438t hours). Let us determine the number of floating cranes that make up the crushed wagons and ships with the daily input and the need to master the load:

$$G_{gün} = 50000 / 100 = 500 \frac{t}{gün}; \quad (10)$$

$$n = G_{gün} / \Pi_{gün}$$

here $\Pi_{gün} = K_{el} \cdot n_n \cdot P_{kom}$ – is the capacity of shipyard in the port, t / day;

n_n - number of turns;

$K_{el} = 0,6 \div 0,8$ is plus productivity, and is a factor that takes into account the impact of technical service on auxiliary mechanisms and devices.

$$\Pi_{gün} = 0,8 \cdot 3 \cdot 437 = 1049t / gün$$

$$n = 500 / (0,8 \cdot 3 \cdot 437) = 500 / 1049 = 0,48$$

4. CONCLUSION

Thus, the calculation shows that a floating crane will be enough for the port. If $E_{yük} = G = 1000t$ is warehouse capacity in the port of loading, the necessary capacity of the warehouse in the port of emptying can be calculated as follows:

$$E_{boş} = G_H (1 - t_e / T) = 50.000(1 - 100/153) = 17320t .$$

ABSTRACT

Quality management should be carried out on the basis of a set of scientifically based principles. All of them can be divided into general, system-wide and special. Among all the system-wide principles of quality management it is necessary to pay attention to the implementation of general management functions. The structure of general management functions includes in the following functions: planning and forecasting, organization, motivation, control. The planning of product quality is the establishment of reasonable tasks for its production with the required values of quality indicators at a given moment or within a specified time interval. The planning for quality improvement should be based on scientifically based forecasting of needs of the internal and external market. The subjects of product quality planning are ultimately various measures and indicators that reflect both the individual properties of the products and the various characteristics of the system and quality management processes. The product quality management receives a lot of attention in all countries. In recent years, a new approach, a new strategy has emerged in quality management, which is implemented through strategic and long-term planning. Recently, one of the important areas of improving the quality of products in an enterprise has been the planning of the preparation of manufactured products (works, services), quality systems and production for certification. Quality forecasting is the process of determining the possible values of quality indicators in the future period of time based on the analysis of quality data obtained in the previous time interval. The main methods of forecasting quality are research and norm. The implementation of research and normative forecasting is carried out by the following main methods: extrapolation; multivariate prediction; expert; mixed. For solving of complicated problems of quality management, should be used complex prediction methods.

Keywords: *general functions, quality planning, quality prediction, quality management, quality systems, motivation, organization*

1. INTRODUCTION

Quality management should be carried out on the basis of scientifically based principles which can be divided into general, system-wide and special. Taking into account of the system-wide principles of quality management, it should be noted that the main principle is that the quality management system should only be an integral part of the system management of the entire enterprise. The quality management system cannot function separately, without interconnection with all other management systems. Therefore, in quality management, the objective general management principles can be used. Among all system-wide principles of quality management it is necessary to pay attention to the implementation of general management functions. The general functions of management include the following functions: planning and forecasting, organization, motivation, control.

2. CHAPTER 1

Under the planning of the product quality is the establishment of reasonable tasks for its production with the required values of quality indicators at the given moment or within a specified time interval. The quality improvement planning should be based on scientifically

based forecasting of the needs of the internal and external market [1]. At the same time, the usage of data on the operation of products and the analysis of information on the actual level of its quality acquire a large role in substantiating plans for improving quality. The effectiveness of quality improvement planning should be ensured by the fact that it is carried out at different levels of management and stages of the product life cycle, including design, production and operation. Quality improvement plans should be supported by the necessary material, financial and labor resources. The planned measures to improve the quality should be justified by calculations of the economic efficiency. The list of the main tasks of planning the improvement of product quality includes:

- ensuring output with the maximum compliance of its properties with existing and future market needs;
- achieving and exceeding the quality of the best domestic and foreign samples;
- establishment of economically optimal tasks to improve product quality;
- improving the structure of products;
- an increase in the production of certified products;
- improvement of individual consumer properties of already manufactured products;
- timely replacement, removal from production of obsolete products;
- ensuring strict compliance with the requirements of standards, technical conditions and other regulatory documents;
- timely implementation of newly developed and revision of outdated standards;
- development and implementation of specific measures that ensure the achievement of the given level of quality;
- an increase in the economic efficiency of production and the use of products of improved quality.

The subjects of product quality planning are ultimately various measures and indicators that reflect both individual product properties and various characteristics of the quality management system. These indicators are reflected in the specific tasks to improve product quality, in plans for standardization and metrological support, the introduction of the quality management systems [4]. Planning for improving product quality is based on the general principles of the planning and application of the planning methods. The general principles of planning include:

- a combination of centralized management with unit independence;
- balanced accounting of resources and opportunities of the enterprise;
- complexity;
- drill down - the degree of planning depth;
- accuracy - the degree of tolerances and deviations of the plan parameters;
- simplicity and clarity;
- continuity;
- the possibility of using reserves and accounting for alternatives;
- taking into account in the planning of the achievements of science and technology, the requirements of promising standards, market needs;
- profitability.

Planning methods include:

- analytical, based on the performed work and the dividing into the used resources, and the analysis of the conditions for their most effective interaction;
- experimental - design standards, regulations and models of enterprise management subsystems on the basis of conducting and studying experiments, as well as taking into account the experience of managers;

- statistical - development of the draft plans based on reports, statistics and other factual information characterizing the real state and changes in the characteristics of the control subsystems.

In the planned activities to ensure the required level of quality, specific types of work are also used:

- analysis of customer requirements;
- study of demand;
- complaint analysis;
- consideration of the requirements of prospective standards;
- study of patent information;
- consideration of the changes in product certification requirements;
- implementation of planned calculations;
- the relationship of planned activities.

The planning links the plans of the company's divisions with its overall strategy and operational objectives. The planning tasks are the formation of the system of plans and indicators for evaluating their implementation. In order to ensure the improvement in the quality of products in the plans, enterprises must require from their suppliers the corresponding improvement in the quality of the raw materials, materials and other components of the products supplied by them. The presentation of increased quality requirements for supplies should be accompanied by assistance to suppliers to improve the quality of their products [1,3]. The forms of such assistance and the cost of its assistance should be the subject of planning for improving the quality of the enterprise. Mostly, the basis of the plan for improving the quality of products in an enterprise is:

- tasks to achieve and exceed the quality level of the best domestic and foreign samples;
- tasks to increase the production of certified products;
- tasks to improve the individual indicators of the quality of products;
- tasks for the development and implementation of specific measures to achieve the given level of quality and etc.

As independent directions of planning for improving the quality of products in the enterprise usually distinguish:

- in-house product quality planning;
- planning the implementation of a quality management system in the enterprise;
- planning of staffing to improve the quality of products;
- planning to reduce the expense of the enterprise for spoilages;
- product quality planning in contracts.

In recent years, the standards of the ISO 9000 series have become widespread, reflecting the international experience of product quality management in an enterprise. In accordance with these documents, a quality policy is defined, including the improvement of product quality management and its provision. The quality policy should include:

- improving the economic situation of the enterprise;
- expansion or conquest of new markets;
- achieving a level of product quality that exceeds the level of leading enterprises and firms;
- focus on customer satisfaction;
- development of products, the possibilities realized on the basis of new principles;
- improvement of the most important indicators of product quality;

- reducing the level of defectiveness of manufactured products;
- extension of warranty periods for products;
- service development.

Product quality management in all countries receives a lot of attention. In recent years, a new quality management strategy has been formed, which is implemented through strategic and long-term planning. It is characterized by:

- quality assurance is understood as a systematic process that permeates the entire organizational structure of a firm;
- quality issues are relevant not only in the production cycle, but also in the process of development, design, marketing and after-sales service;
- quality should be focused on meeting the requirements of the consumer, not the manufacturer;
- improvement of product quality requires the use of new production technology, automation in the process of quality control;
- a comprehensive quality improvement is achieved only by the interested participation of all employees.

The above is feasible only with the action of a well-organized quality management system aimed at the interests of consumers, affecting all divisions. For the structural units of the enterprise, depending on their specifics, it is necessary to set specific targets for improving the quality of production and quality of work. These tasks should be clearly linked to the subsequent assessment and stimulation of production activities of structural units. For the assembly shops of enterprises it is advisable to plan: the main indicators of product quality; the level of delivery of products from the first presentation; reduction of expense for spoilages and complaints. For these workshops, it is also advisable to plan to reduce the number of returns of parts from consumers. For auxiliary workshops, it is advisable to plan both indicators and activities, the implementation of which should ensure the high quality of products in the main workshops. If the quality of products and the quality of the works cannot be expressed by a small number of indicators, then it is advisable to use quality factors. The level of quality factors depends on the implementation of a large number of measures to improve the quality of manufactured products. Based on their specificity, their own criteria for quality improvement and the corresponding standards for changes in indicators are established [3]. It should be noted that the quality of production and the quality of work can be the object of internal production planning. In shops, this is the share of products delivered from the first presentation, reduction of expense for spoilages and complaints and return of products from consumer shops. The required level of product quality can be jointly established by its manufacturer and the consumer in the contract. When planning the required level of product quality in contracts, it is necessary to take into account that its determination can be carried out in the following ways: by standards; on samples, catalogs and projects of the seller, which is an integral part of the contract. For complex technical products and products for which there are no standards, quality is determined by technical conditions. In this case, the technical conditions are usually given in the annex to the contract themselves. The quality of the food products is confirmed by the presence of an appropriate certificate, a veterinary certificate issued by the veterinary service, as well as a sanitary certificate issued for each consignment of goods. In determining the quality of the sample supplier provides the consumer with a sample of products. After confirmation by the consumer of this sample, it becomes a benchmark. In contractual relationships between suppliers and consumers, conflicts often arise, so the selected samples are stored not only from the parties to the contract, but also in a neutral firm set forth in the contract. Among the requirements for the quality of products, the production of which is organized simultaneously

in a few enterprises, the parties to the contract may indicate in the contract text the specific manufacturer of the product. A serious problem that arises when planning product quality in contracts is a clear definition of all the conditions for checking the quality of the goods. Checking the quality of goods always depends on its nature and purpose. If the product is a technically complex product, then it must be checked in the work. To do this, the consumer should be granted the right to make claims for a sufficiently long period of time. If the goods are food products, its quality acceptance usually consists of an external examination and examination. Such an acceptance is carried out on the basis of documents confirming the quality of the goods, the date and place of its production, the shelf life, etc. Product quality guarantees are usually highlighted in a separate article of the contract.

3. CHAPTER 2

When creating a new product, it is often necessary to forecast it first, and then develop the complex basic quality indicators to optimize the numerical value of the complex quality indicator which the quality level of the production is evaluated on its basis. Only after this, they proceed to the development of the design and technology of manufacturing a new product with a corresponding quality level. Quality forecasting is the process of determining the possible values of quality indicators in the future period of time based on the analysis of quality data obtained in the previous time interval. Predicting product quality is a probabilistic assessment of the movement and change over time of the combination of indicators characterizing quality [2]. The main methodological methods of forecasting quality are research and regulatory. Research forecasting is focused on existing and potential opportunities. It involves the analysis of existing trends in indicators of the quality of similar products over time. The purpose of the research forecast is to determine alternative values of quality indicators based on the achieved level of knowledge about the predicted quality of products. Regulatory forecasting is aimed at solving problems arising both now and in the future. It allows you to formulate goals and objectives that must be solved. In this case, particular tasks are considered in stages and in the direction from the future to the present. For regulatory forecasting, you must have a regulatory framework for quality indicators. These standard indicators are the quantitative requirements of the relevant standards. The use of standards, reflecting the achievements of scientific and technological progress, and the consideration of production capabilities allow us to predict the level of quality for the future. The implementation of research and regulatory forecasting is carried out by the following main methods [3]:

- extrapolations;
- multifactor prediction;
- expert;
- mixed.

Expert forecasting methods basically allow us to solve issues of the forward-looking assessment of product quality indicators with the evolutionary nature of the development of science and technology. The possibility of the appearance of a “jump” determines the use of mainly expert methods of forecasting. A promising factographic method, allowing to establish the limiting technical capabilities of this generation of products is the method of enveloping curves.

4. CONCLUSION

Recently, one of the important areas of improving the quality of products in the enterprise has been the planning of the preparation of manufactured products (works, services), quality systems and production for certification. In drawing up quality improvement plans for each structural subdivision, one should proceed from the level of quality indicators approved in the enterprise plan.

The widespread use has a quality prediction method based on the analysis of cycles of fluctuations of their level of quality and cycles of fluctuations in the demand for these products. This method allows you to determine not only the achievable values of a parameter within a given product generation, but also to calculate the time of appearance of a new product, as well as the period of the possible existence of this product generation. To solve complex problems of quality management, the complex forecasting methods should be used.

MANAGEABILITY OF FINANCIAL RISKS AS AN IMPORTANT FACTOR OF FINANCIAL STABILITY

Shafa Guliyeva

shafa.guliyeva@gmail.com

ABSTRACT

The article notes that in modern conditions risk is an inevitable element in making any economic decision. There is a limit after exceeding which the risk could jeopardize the functioning of a business. Therefore, it is necessary to determine whether the expected profitability is sufficient for risk aggregation and realization of profits. Much attention is paid to the importance of a rational choice for a probable assessment, considering risk situations and substantiation of design options for decisions made. It is necessary to distinguish between managed and unmanaged risk situations. The problem of expansion and strengthening of the degree of controllability of financial risks arises based on an accurate assessment of the real risk situation. Manageability of financial risks acts as an important factor of financial stability. In turn, neutralization of uncertainty factors to some extent can be assessed as a form of financial risk management and effective consideration of risk factors in the implementation of an economic strategy. As a result, positive changes in the financial system develop into a qualitatively new condition contributing to financial stability. In general, financial risk shows the imperfection of the self-regulation market mechanism and makes external regulation necessary. Therefore, in the conditions of spontaneous market relations, the role of state regulation is increasing. To ensure financial stability, enterprises must maintain their solvency, liquidity and creditworthiness at the right level. The economic strategy of the state and business structures are dialectically interconnected with state regulation methods. The main task of ensuring the sustainability of the financial system based on its systemic regulation is to achieve manageability of financial risks in this area.

Keywords: *financial risks, financial system stability, risk manageability, regulatory methods, uncertainty*

1. INTRODUCTION

In the current context, uncertainty is an inevitable characteristic of economic environment. It is known that the liberalization of the economy, openness of economic systems and globalization of world economic processes stimulate both internal and external factors of chaotic tendencies, give rise to new areas and objects of uncertainty. Thus, uncertainty is present in all areas and processes of the economy. Accordingly, risk is an objectively inevitable element in making any economic decision. Risk is the uncertainty of income generation and the probability of loss of the net worth of the company. There is a limit, to exceed which is to jeopardize the functioning of a business. The risk must be calculated to the extent possible [1]. Therefore, it is necessary to determine whether the expected profitability is sufficient to offset the risk and to make a profit. Many a time, companies face risks arising from business development, such as an extension in planning horizons, an increase in the unpredictability of the external environment, and a competitive expansion. Uncertainty is a source of potential risks and, therefore, losses. Of great importance is the systematic study of the characteristic signs of the manifestation of uncertainty in various spheres and processes. It is important to consider the singularity and nature of the analyzed economic systems and processes. Competition between producers and buyers, contradictions between the interests of monopolies, large discrepancies and deviations limit the effectiveness of the market systems, reduce the effectiveness of applied economic resources and the level of macroeconomic stabilization, as well as impede the achievement of

strategic economic goals. All this contributes to the increasing complexity of risk situations and uncertainty in all areas. Therefore, it is especially important to make a rational choice according to a probable assessment, taking into account risk situations and validity of the calculated options for decisions made. It is necessary to draw a line between manageable and unmanageable risk situations. All this can largely contribute to minimizing the impact of these factors on the increasing uncertainty [2]. Thus, neutralization of uncertainty factors can be considered to some extent as a form of an effective financial risk management in the implementation of an economic strategy. Every firm, corporation and the state as a whole should be objectively interested in risk management. Therefore, both the company and the state should strive to find acceptable and more advanced methods to reduce randomness and uncertainty, as well as to avoid risk. In more complex situations, the prevention and prediction of possible risks should be based on the most advanced scientific methods, including mathematical statistics. In this case, we understand the concept of "prevention" and "prediction" as elements of regulation and risk management. Regulation itself does not completely eliminate financial risks in a market economy, however, it mitigates the existing circumstances, facilitates business activity, and as a result, the degree of controllability of financial risks increases, which is known to be an important factor of financial stability. In economics, stability is considered as one of the notions of the concept of economic development. The stability of an economic system can be defined as its ability to maintain constancy in a changing external and internal environment, as well as spontaneous, accidental or deliberate transformations [3]. In this connection, the problem of expansion and strengthening of the degree of controllability of financial risks arises on the basis of an accurate assessment of the real risk situation. Methods of financial risk management should fully comply with the needs and requirements of the modern financial system, they should also contribute to strengthening of the financial stability by expanding the range of financial risk manageability. This approach is especially important in crisis situations, when financial opportunities are limited. Since the higher the level of controllability of financial risks, the greater the possibility of minimizing expenditures of financial resources. As a result, positive changes in the financial system develop into a qualitatively new state, contributing to financial stability.

2. THE COMBINATION OF GOVERNMENT STRATEGY AND BUSINESS STRUCTURES IN THE FIELD OF FINANCIAL RISK MANAGEMENT

Financial risk reveals the imperfection of the market self-regulation mechanism and makes external regulation necessary. The market mechanism cannot prevent imbalances in the financial system and the economy as a whole, and to ensure the stabilization of macroeconomic indicators. In the conditions of spontaneous market relations, the role of state regulation increases significantly. In this case, it is important to apply principles and methods of rational choice of the economic activities of the market system participants, taking into account their economic goals and behavioral motives, the optimal combination of state strategy with corporate strategy. The recognition of economic goals and strategies by the state and entrepreneurs is of great importance in managing financial risks. This should be a priority recognized both by the state and by business structures [4]. In general, in order to achieve manageability of financial risks, risk management processes at the macro and micro levels should complement each other. Indeed, according to the system theory, each particle of a system must itself carry the features of the entire system, and, in its turn, the final state of the system depends on the state and interdependence of all the constituent particles. With a market economy and, moreover, with a fast-paced business environment, risk management comes to the fore for entrepreneurs. Today, there is no business without risk. It is true that the one who does not risk takes the greatest risk. But one must take the risk at the right time. It is widely believed that high-risk market transactions always generate the greatest profit.

But it's not always the case. The main thing is to predict future situations as accurately as possible and handle them proactively. After all, all market valuations are multivariate. The risk must be reasonable. It must be calculated to the extent possible. As is known, no one is inoculated against the mistakes of the entire market activity. However, everything needs measure. The entrepreneur, along with the accurate calculation of future operations, must also constantly adjust the system of actions from the perspective of maximum profit, provide additional opportunities to mitigate unexpected turns in the market in order to reduce possible losses as much as possible. Risk management is one of the most important areas of modern management in the context of a complex choice of management decisions. When developing a risk business, an entrepreneur who avoids risky decisions dooms the organization to a loss of competitiveness. In modern conditions with the expansion of range of risky situations, risk management is a necessary element of control. The main tasks of the manager in risk management are to identify the area of increased risk, to assess the degree of risk and to take measures to prevent it. In order to achieve risk controllability, it is necessary to predict to a certain extent the occurrence of a risk event and take measures to reduce risk in time. As a rule, the risk of an entrepreneur is quantitatively characterized by an estimate of the expected value of the maximum and minimum income (loss) from capital investment. The greater the range between the maximum and minimum income (loss) with equal probability of receiving them, the higher the degree of risk. And accordingly, the greater the uncertainty of the economic situation, the higher the degree of risk. It is very important to keep in mind that in risk management there can be no sample and ready-made recipes. Definitely, one cannot risk more than the capital can allow, and still one shall not risk much for the sake of the small. Before making a decision on the risk-related capital investment, the manager must determine the maximum amount of loss for this risk, compare it with the amount of invested capital and with all its own financial resources. A sensible entrepreneur is unlikely to put their business at risk to utter ruin and will not risk all their means to achieve the goal. Risk management means correct risk assessment. It is important for an entrepreneur to know the cost of the risk to which their activity is exposed. Under the cost of risk, the actual losses of the entrepreneur, the cost of reducing the amount of losses or the cost of compensation for these losses should be understood. Based on the available information, various options for risk-related capital investments are developed and an assessment of their optimality is provided by comparing the expected profit and the risk magnitude. This allows you to choose the right risk management strategy and techniques, as well as ways to reduce the risk. In order for financial risks to be manageable, one must be able to feel the risk, assess its degree and not overrun allowable limits. To ensure financial stability, enterprises must maintain their solvency, liquidity and creditworthiness at the right level. After all, the stability of the financial condition of enterprises is, first of all, its ability to make timely payments to the state, suppliers and other creditors. But the financial stability of enterprises depends not only on internal, but also on external factors. The internal factors include the state of the company's assets, their turnover, as well as the structure of the sources of formation of these assets. External factors include state budget and tax policies, interest and depreciation policies, market conditions, etc. [5]. Experience has proven that external factors most adversely affect the financial position of enterprises. In connection with inflation and a reduction in demand, economic ties are collapsing and, as a result, the financial position of enterprises remains fragile. At present, in order to ensure a stable financial position of enterprises, the main task in the field of financial management should be to find sources of financing in order to increase capital with minimal risk for the borrower. In market conditions, in order to reduce the possibility of risk-related situations, the use of borrowed funds for financing is impractical, since their high share leads to even greater financial instability. In a context of uncertainty, state regulation with the use of a wide range of instruments plays an important role.

The economic strategy of the state, in contrast to the strategy of entrepreneurs, is usually of a macroeconomic nature. In the social and economic terms, this strategy is predetermined by the criterion of models of various economic systems. The economic strategies of the state and the business structures are dialectically interconnected with state regulatory methods, in particular financial and economic, regulatory and administrative, legal and market regulation. In this regard, it is time to stop the trend of opposing state regulation and self-regulation. It is clear that it is impossible to organize the economic life of society basing on nothing but the market principles; the market itself is not able to provide economic sustainability. However, this does not mean a mechanical combination of state regulation with self-regulation and self-organization, of power structures with a business structure. The major task of regulation is the specific definition of the main landmarks and levers of economic dynamics. Unfortunately, the global crisis clearly showed that the situation in the financial sphere moved beyond the framework of scientific interpretation of economic problems, the tendency to conduct a variety of major frauds and manipulations on the financial market intensified, and the interests of investors were infringed. But the post-crisis financial concept has not yet become a regulatory phenomenon, a fundamental factor in the stability of the financial system.

3. ACHIEVING MANAGEABILITY OF FINANCIAL RISKS AS THE MAIN CONDITION FOR FINANCIAL STABILITY AND SUSTAINABILITY

A stable financial system has the ability to limit and eliminate imbalances through self-adjustment mechanisms before they lead to a crisis, i.e. the ability to function, keeping its structure unchanged and maintaining balance [6]. The system analysis of factors that adversely affect the normal functioning of the financial system is very important in present-day conditions. In general, financial regulation should be aimed at reducing systemic risk and protecting investors. As is commonly known, financial instability is directly related to two conditions. The first one concerns the existing structural and macroeconomic conditions in the productive economy in which the financial system operates. The second condition is directly related to the financial system itself, i.e. the state of financial markets and conditions for the conclusion of financial transactions. In order to analyze the possible channels of financial instability, it is necessary to distinguish between macro- and micro-measures of systemic risk. Macro-systemic risk arises when the entire financial system is exposed to macroeconomic risk. This happens if the risks assumed by financial institutions are mutually correlated and, as a result, the weakening of the entire financial system can lead to deleverage, i.e. reduction of business loans. Micro-systemic risk occurs when the bankruptcy of an individual institution has an adverse effect on the financial system as a whole. For example, financial institutions connected by credit lines with a bankrupt company may incur losses as a result of risk-related situations [7]. Macro- and micro-systemic risks are often interconnected and one can lead to another. Financial regulation should also be aimed at protecting the interests of private consumers and investors. This protection in the financial markets is necessary, because they have information problems that allow financial product sellers to get advantages compared to the buyers of such products. It should be noted that consumer protection is quite well defined and concerns the conduct of operations in both retail and wholesale markets. The stability of the financial system is an important condition for preserving its own integrity and sustainability of the economic system as a whole. The stability of the financial system involves a balanced, dynamic economic development. The main task of ensuring the sustainability of the financial system based on its systemic regulation is to achieve manageability of financial risks in this area.

4. CONCLUSION

The global financial and economic crisis has shown once again that the main conditions for successful social and economic development is the sustainability of the financial system. In the current context, risk is an inevitable characteristic of economic conditions. A financial system is considered sustainable if it allows assessing and distributing financial risks and managing them. According to the law of system analysis, a financial system can be considered stable if it has self-regulation mechanisms. In conditions of spontaneity of market relations, state regulation plays a significant role. The economic role of the state and business structures should be dialectically interrelated in the field of financial risk management. In this regard, it is time to stop the trend of opposing state regulation and self-regulation. It is clear that it is impossible to organize the economic life basing on nothing but the market principles: the market itself is not able to ensure economic sustainability. At the macro and micro levels, the method of managing financial risks must fully comply with the requirements of the modern financial system, and they should also contribute to strengthening of the financial stability by expanding the range of financial risk manageability.

ABSTRACT

The paper investigates impact of foreign direct investment (FDI) in the oil sector in Azerbaijan on sustainable development, including components of the economic growth and well-being of the population. Assessment of employment level dependence on FDI shows that FDI in the oil sector does not have a significant impact on employment. There are several reasons for this. First, main part of FDI volume entering the country is mainly focused on the oil sector, this sector is capital-intensive, not labor-intensive, and investments are spent in the development of more core capital and application of new technologies in this sector. Although FDI has a certain impact on the level of employment in the oil and gas sector, such impacts are not felt in the economy as a whole. The effects of FDI on the poverty level are also an important issue. Studies show that the use of FDI is crucial in reducing poverty. As well as this paper shows that FDI plays an important role in reducing poverty in Azerbaijan. The impact of FDI on poverty takes place in different countries through different mechanisms. This is due to the diversity of areas where the FDI is directed. Since the main part of the FDI in Azerbaijan focuses on the oil and gas sector, the value added generated in this sector allows the country's revenues to be recovered from the Oil Fund and the redistribution through the state budget make it possible for the FDI to be used efficiently. Thus, the fact that FDI is included in the country does not mean that the economic and socio-economic effects of this funding are positive. The positive impact of economic effects of FDI and its rational use depend on the economic conjuncture of each country.

Keywords: *employment, GDP, income, investment, oil sector, poverty, sustainable development*

1. INTRODUCTION

The contradiction between globalization and autarky presents itself in various fields, including local governments, in the relations between International Financial Institutions and Transnational Companies. The globalization process involves a broad spectrum of cooperation between local governments and international organizations, and, on the other hand, the autarky means the country's economic self-sufficiency and its isolation from the global economic system. The activity of transnational companies in other countries, especially in developing countries, contributes to the rapid integration of these countries in the globalization process. It is no coincidence that all methods of assessing globalization quantitatively are reflected in cooperation of local countries and transnational companies. Transnational Companies are the second important instrument for the realization of the globalization process as International Financial Institutions. The essence of mechanism of these companies' activity is related to the fact that the direct investment enter the country freely and the exemption of earnings from the country is free. Some impacts of foreign investment directed to Azerbaijan are similar to the impacts related to "countries with transition economies". In such countries, investment environment is very similar to each other. Investment environment depends on the political, economic, social, geographical and other factors of the country.

Most favoured investment environments in most of the newly-separated countries from Soviet-type economic planning, including Azerbaijan, could not have been suddenly established. Because investment risk for some of these countries such as Azerbaijan, Kazakhstan and Russia was still high, though they have investment potential. Legislative system and state administration necessary for investment protection and creation of favorable business environment were not fully formed. Most of these countries did not have political stability. The political stability necessary for the flow of foreign investments in Azerbaijan only came into existence in 1994. In the subsequent years, the sustainability of this stability had a significant impact on the volume of investments. The investment ratings given to Azerbaijan by international organizations involved in assessing investment climate prove it.

2. LITERATURE REVIEW

In economic literature, there are many studies dedicated to the impact of investment directed to an oil sector on the economic development or any economic activity of some countries. For example, L. Alfaro confirms it considering positive effects of foreign direct investment on economic growth (Alfaro, L., 2003), (De Mello, Jr.L.R., 1997), and David Kim and Jung-Soo Seo empirically in the example of Korea (Kim, D.D.K. and J.S. Seo, 2003). Such studies are often seen in the oil-rich countries. This problem is always in the focus of attention in Azerbaijan's economic science. A.Musayev (A. Musayev, Khatai Aliyev (2017), E. Hajizade (Hajizade E. (2012), M.Gulaliyev (M.Gulaliyev, 2016) and others have studied this problem from a variety of perspectives, but in most of these studies economic growth was taken as a whole object of research.

3. METHODOLOGY

According to R. Lipsey (*Lipsey R.E, 2003*), assessment of the impact of foreign investment on the country's economy is important for three reasons. Firstly, such assessments clarify the necessity of involving foreign investment in the country. Secondly, such assessments help to create the right economic policy on how much and on what terms foreign investments are involved. Thirdly, such assessments create conditions for the “weak” points of the country's economic system to benefit from foreign investment in the future. Failure to study the effects of foreign direct investment (FDI) in the oil sector on separate components of economic growth puts its social importance and potential impact on the welfare of the population in the shade. On the other hand, non-learning of impacts of FDI on economic growth and its components through econometric methods can not allow predicting long-term impacts. So, the main question we face is how foreign direct investments to the oil sector affect the economic growth and its components. Here are two hypotheses that need to be identified:

- 1st hypothesis: H_0 : There is no effect of foreign investments directed to oil sector (X1), on cumulative FDI (X2) to oil industry, total foreign investments (X3) on economic growth (Y1), employment level (Y2), per capita income (Y3), poverty level (Y4).
- 2nd hypothesis: H_1 : The indicators of X1, X2, X3 have the effect on the indicators of Y1,Y2,Y3.

In order to determine the dependence of economic growth and other indicators on the development of the oil and gas sector, we can describe the relationships we have mentioned above in 4 equations as follows.

$$Y1_t = a1_t + b1_t * X1_t + b2_t * X2_t + b3_t * X3_t + e1_t \quad (1)$$

$$Y2_t = a2_t + c1_t * X1_t + c2_t * X2_t + c3_t * X3_t + e2_t \quad (2)$$

$$Y3_t = a3_t + d1_t * X1_t + d2_t * X2_t + d3_t * X3_t + e3_t \quad (3)$$

$$Y4_t = a4_t + h1_t * X1_t + h2_t * X2_t + h3_t * X3_t + e4_t \quad (4)$$

Here, $Y1_t, Y2_t, Y3_t, Y4_t$ express, properly, indicators of GDP volume, employment level, per capita income and poverty level for years; $X1_t, X2_t, X3_t, X4_t$ express, properly, indicators of foreign investments to oil sector, cumulative FDI for oil industry and physical volume of total foreign investments for years; $a1_t, a2_t, a3_t, a4_t, a5_t; b1_t, b2_t, b3_t, b4_t, c1_t, c2_t, c3_t, c4_t, d1_t, d2_t, d3_t, d4_t, h1_t, h2_t, h3_t, h4_t$ are coefficients, $e1_t, e2_t, e3_t, e4_t$ are balances.

4. RESULTS

The main part of foreign investments attracted to Azerbaijan is related to direct investments (FDI). As with financial loans, the main part of the FDI is focused on the energy sector, or rather the oil sector. The volume of domestic investments directed to the economy of Azerbaijan as well as the distribution of foreign investments by oil and non-oil sectors show that the volume of investments directed to the non-oil sector over the past 20 years is comparable to other types of investment. In other words, it is not right to link certain development of the non-oil sector in Azerbaijan to investment in the oil sector in recent years. So, both foreign investment and domestic investment is directed to the development of this field. However, it should be taken into account that investment in the non-oil sector is also linked to the oil and gas sector. When investing in the non-oil sector, the population's living standards, purchasing power are taken into account. The latter are largely dependent on foreign investment in the oil sector. Until 2009, the FDI in Azerbaijan's economy dominated the domestic investment, but an increasing tendency was observed. In subsequent years, domestic investments have increased dramatically. The coherent structure of foreign investment in the Azerbaijani economy also provides interesting information. Thus, if foreign investments directed to the oil sector exceeded the foreign investments attracted to the non-oil sector by 2008, the situation changed after that year. Since 2008, most of the foreign investment has been attracted to the non-oil sector. This is due to the fact that after the complete realization of the "Contract of the Century" by 2008 and the infrastructure necessary for the construction of the Baku-Tbilisi-Ceyhan pipeline in 2004, the volume of investments in the oil sector declined in the years to come. Such a landscape is also observed in the CIS countries. In 2010, the volume of investment in other CIS countries also decreased. In 2010, foreign investment in these countries decreased by 5% to \$ 68 billion compared to 2009. (World Investment Report, 2011). With the realization of the gas contracts signed by Azerbaijan in recent years, it is expected that foreign investments in the energy sector and oil industry will increase again. As the main source of foreign direct investment is developed countries, the global financial crisis has a negative impact on this process. Decrease in the volume of FDI in developing countries during the 2008 financial crisis showed similarly itself in the amount of foreign investment in Azerbaijan. In 1995, more than 37% of the foreign investment was directed to the oil sector, based on investments in fixed capital in the Azerbaijani economy. By 2004, this figure was even more than 89%. In the following years, the share of investments in the non-oil sector has increased. The share of the non-oil sector in the division of domestic investment is much higher than in the oil sector. For example, the volume of domestic investments directed to the non-oil sector in the economy of Azerbaijan exceeded the oil sector by 2.7 times until 2002. In the subsequent years, this tendency continued, and the volume of investments directed to the non-oil sector was considerably higher than in the oil sector. This is mainly due to two reasons. Firstly, the oil sector in Azerbaijan is in state-owned sector and it is impossible for domestic private sector entities to invest in this sector. Secondly, since most of the companies operating in the oil sector are foreign companies, more foreign investment is being

directed to this sector. Most of the foreign investment in the economy of Azerbaijan is related to the oil industry. So, the main share in the list of the countries investing is related to the countries, which have the ownership of transnational companies, which are well known in this field of the economic activity. The UK and the US, which are directly investing in oil fields in Azerbaijan are the countries that transnational companies which have a leading role in Azerbaijan International Operating Company, BTC Co and SCP Co, are situated. Turkey and the UK have the largest share in the volume of foreign investments attracted to the Azerbaijani economy by joint ventures and foreign investment enterprises. Nevertheless, foreign investments in this type constitute very few of the total foreign investment. Only 9% of foreign direct investment in Azerbaijan in the period from 1995 to 2013 amounted to \$ 81.1 billion, is related to the joint ventures and foreign investment enterprises. The cumulative volumes of foreign direct investments as separate indicator as well as the annual foreign direct investments directed to the oil and gas sector. This is due to the fact that the effects of the investment can be felt in a few years.

Table 1: FDI and dynamics of some macroeconomic indicators

Years	GDP volume (million AZN)	Employment Level	Per Capita Income	Poverty level	FDI to the oil industry (USD million)	Cumulative FDI to the oil industry (USD million)	Total foreign investments (USD million)
	GDP	UNEM	INCOME	POVERTY	X1	X2	X3
1995	2134	99.2	-	-	139.8	139.8	375.1
1996	2733	99.1	-	-	416.2	556.0	620.5
1997	3158	99.0	-	-	780.1	1336.1	1307.3
1998	3441	98.9	-	-	891.8	2227.9	1472.0
1999	3775	87.3	-	-	544.5	2772.4	1091.1
2000	4718	88.2	508.9	-	546.1	3318.5	927.0

Note: The table is based on the data of the State Statistical Committee of the Republic of Azerbaijan

Here is given the correlational relationship between the volume of GDP and investment in the oil sector, the cumulative volumes of such investments and the overall macroeconomic indicators with the volume of FDI in Azerbaijan. As you can see from the table, there is a serious correlation between GDP volumes and X1, X2 and X3. Because of the multicollinearity among last three variables, we will take the third variable, namely the total FDI volume (X3) for the country's economy, as a key variable for the research. The calculations show that GDP dependence on X3 is strong enough and the H_1 hypothesis is justified for the correlation between these indicators (Table 2).

Table 2: Dependence of GDP volume on FDI in Azerbaijan

Dependent Variable: UDM

Method: Least Squares

Date: 09/01/17 Time: 13:09

Sample: 1995 2016

Included observations: 22

Variable	Coefficient	Std. Error	t-Statistic	Prob.
X3	5.703709	0.334653	17.04367	0.0000
C	-4549.384	2177.563	-2.089208	0.0497

Prob(F-statistic)	0.000000			

Note: the author has calculated through the EViews programming

Using the statistical results in Table 2, the model of communication between GDP and oil revenues in Azerbaijan can be summarized as follows:

$$\widehat{GDP} = 5.7037 * X3 - 4549.384 \quad (5)$$

(0.3346) (2177.563)

If we look at the dependence of employment level on the variables X1, X2 and X3, we see that these indicators do not have a significant impact on employment. There are several reasons for this. The firstly, that investments in this sector are mainly focused on the development of core capital and the application of new technologies, since the main part of the FDI, which is part of the country, focuses on the oil sector, and this sector is not labor-intensive, but more capital-intensive. Although FDI has a certain impact on the level of employment in the oil and gas sector, the impacts of the economy overall are not so significant. The second reason is that most of the employed population in Azerbaijan has a status of “self-employed”. According to the World Bank, in 2017 only 35% of the employed population are salaried workers in Azerbaijan. Over the last 25 years this figure has increased from 22% to 35%. According to the data of the State Statistical Committee of the Republic of Azerbaijan, the employment in the oil and gas industry has only 1% of the total number of employed population. But given that oil revenues from the industry boost the development of other industries in the country, then level of employment would also be dependent on the FDI towards this sector. However, as a result of the reallocation of the incomes along with the fiscal policy, the impact of the FDI on employment is not at the level to be felt. Therefore, the H_0 hypothesis is valid for the connection between these indicators. An analysis of the dependence of the per capita income on FDI also suggests that the correlation between these indicators is strong. But since X1, X2, X3 have multicollinearity, we will only consider X3 in the model.

Table following on the next page

Table 3: Dependence of per capita income on FDI volume in Azerbaijan

Dependent Variable: ABGELIR
 Method: Least Squares
 Date: 10/01/17 Time: 14:44
 Sample (adjusted): 2000 2016
 Included observations: 17 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
BXI	0.418182	0.035914	11.64413	0.0000
C	-430.1042	265.0420	-1.622778	0.1255
R-squared	0.900389	Mean dependent var		2312.459
Adjusted R-squared	0.893748	S.D. dependent var		1537.362
S.E. of regression	501.1229	Akaike info criterion		15.38171
Sum squared resid	3766863.	Schwarz criterion		15.47974
Log likelihood	-128.7445	Hannan-Quinn criter.		15.39145
F-statistic	135.5857	Durbin-Watson stat		0.854104
Prob(F-statistic)	0.000000			

Note: the author has calculated through the EViews programming

Thus, calculating the correlation relationship between the volume of per capita income and the FDI volume gives such a result that the correlation coefficient between these two indicators is strong enough and $R = 0.95$. Therefore, we can express the equation (3) as (6):

$$\widehat{INCOME} = 0.418182 * X3 - 430.1042 \quad (6)$$

(0.0359)
(265.042)

The impacts of FDI on the poverty level are also an important issue. Since the main part of the FDI in Azerbaijan focuses on the oil and gas sector, the added value generated in this sector, the accumulation of the country's revenues in the Oil Fund and the redistribution with the state budget make it possible for the FDI to be effectively used. Thus, FDI flows to the country do not mean that the economic and socio-economic effects of this funding are positive. The positive nature of the economic impacts of the FDI and its rational use depends on the economic conjuncture of each country.

Table 4: Dependence of the poverty level on FDI in Azerbaijan

Dependent Variable: RPOVERTY
 Method: Least Squares
 Date: 10/01/17 Time: 17:08
 Sample (adjusted): 2001 2015
 Included observations: 15 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
X3	-0.004667	0.000590	-7.911315	0.0000
C	51.80495	4.366336	11.86463	0.0000
R-squared	0.828017	Mean dependent var		20.56667
Adjusted R-squared	0.814788	S.D. dependent var		16.77305
S.E. of regression	7.218501	Akaike info criterion		6.914738
Sum squared resid	677.3879	Schwarz criterion		7.009144
Log likelihood	-49.86053	Hannan-Quinn criter.		6.913732
F-statistic	62.58891	Durbin-Watson stat		0.687754
Prob(F-statistic)	0.000003			

Note: the author has calculated through the EViews programming

$$\widehat{Poverty} = 51.805 - 0.00047 * X3 \quad (7)$$

(4.3663)
(0.00059)

According to the model (7), the poverty level in the country is expected to decrease as the FDI increases. Significant correlation between these two indicators for the Azerbaijani economy shows that the decline in FDI should be necessarily compensated by domestic investment. Otherwise, the poverty level in the country may increase.

5. DISCUSSION

Studies show that rational use of FDI is crucial in reducing poverty. For example, researches conducted by V. Denisia (Denisia V., 2010), T. Sisili, D. Elango (Sisili T, Elango D, 2013) are considered FDI as an important medium for poverty reduction. Studies show that the FDI plays an important role in reducing poverty in Azerbaijan. The effects of FDI on poverty occur in different countries through different mechanisms. This is due to the diversity of areas in which the FDI is directed.

6. CONCLUSION

FDI plays an important role in reducing poverty in Azerbaijan. Since the main part of the FDI in Azerbaijan focuses on the oil and gas sector, the value added generated in this sector allows the country's revenues to be recovered from the Oil Fund and the redistribution through the state budget make it possible for the FDI to be used efficiently. Thus, the fact that FDI is included in the country does not mean that the economic and socio-economic effects of this funding are positive. The positive impact of economic effects of FDI and its rational use depend on the economic conjuncture of each country.

ABSTRACT

*Demographic potential depends on regional demographic processes and social-economic factors. The related research on 2 economic regions of Azerbaijan had performed taking into account indicators of the demographic potential and defining it impacting factors, already formed processes and indicators such as population number, age and gender groups shares, migration and marriage processes, demographic waves and behavioral characteristics. In framework of mid-term and long-term sustainable development planning predictive models had developed based on multidimensional (involving environmental, social, economic and institutional aspects) approach. Data analysis and models of demographic processes were developed for each administrative rayon. Data analysis and predictions results show demographic potential of each administrative rayon highly depends on its economic development indicators. More important conclusion reflects risk of demographic potential diminishing in future as a result of demographic waves formed in a period of economic crises.
Keywords: Capacity, Demographic, Development plans, Potential*

1. INTRODUCTION

The complex planning project of the region is such a document that should address complex economic, urban, technical, environmental and social issues and the efficient utilization of existing resources. It is natural that in the settlement of the aforementioned issues, the organization and use of the territory of the region in front of the projectors is a primary problem. The rapid development of modern science and technology, social and economic progress, rapid economic development, the impact of human activity on nature, transport increase, urbanization process, and other factors put new demands on regional planning. The main objective of the regional planning is to provide the optimal conditions for sustainable development of the production, the creation of new settlement systems by improving life conditions of the existing population, provision of inter-community services, environmental, historical and architectural monuments, protection of residential areas from hazardous geological and natural disasters, in order to prepare proposals that will ensure the effective and efficient use of energy and labor resources.

In modern conditions, regional planning is an important document that ensures the efficient deployment of new nationally-owned facilities, as well as a proposal for a sustainable solution to the challenges of nature and the environment, which provides for sustainable development and ecological balance.

2. OBJECTIVES OF PROJECT

- Establishing long-term strategies by assessing trends in sectors such as settlement, agriculture, industry, tourism, transport through national, regional and inter-regional balances;
- Establishing a balance of natural, historical and cultural values, making a comprehensive assessment of the region on the basis of administrative and functional unity, maximizing the use of natural and natural sources of nature;
- creating a regional planning scheme that allows for sustainable socio-economic development, planned development within the boundaries of the region, and the ability to optimize urban living.

3. SCOPE OF WORK

The object of the project is Lankaran - Astara Economic Region, consisting of Astara, Jalilabad, Lerik, Lankaran, Masalli and Yardimli regions. The total area of the economic region is 6,07 thousand square kilometers, and the number of population is 824018 according to the 2009 census.

Design of regional territorial scheme:

- Current situation - 01.01.2010
- 1st stage (first-priority measures) -2018
- 2nd stage (reporting period) - 2030.

The main economic and social indicators for the Lankaran-Astara region's current status are based on January 1, 2010. Thus, in the complex planning project of the Lankaran-Astara region, its natural conditions and resources are estimated, their usage trends, the prospects of development of the region in the economic and social fields are determined on the scientific basis, the areas of development of the national economy are defined, the architectural planning design of the region is defined and functional zones the area is complex, and the future of the population and its settlements, transport and other engineering networks are being developed, environmental and historical monuments are protected and restored, and the cultural and community service is provided to the population. The study of the current situation of the region requires the comparison of development trends, naturalized project indicators and living conditions learned by population surveys with generalized project, statistical, plan, economic, geographical, historical and other relevant materials.

4. TERMS AND METHODOLOGY OF POPULATION FORECASTING

Predictability of the population is based on the results of the demographic potential assessment presented in the previous sections and the scenario selected for the socio-economic development of the area. This is based on the demographic and employment policies of the state, the optimal growth of population and full employment. In the forecast, the reforms in all areas of the country's economy, construction of infrastructure facilities, improvement of cities and settlements, issuance of preferential loans for development of state-owned enterprises for businessmen, creation of new jobs in the region and villages, social and economic well-being of the population and improvement of living standards of families were taking.

The following trends of designing a demographic forecast should be taken into account:

1. The population growth rate in the region is relatively high compared to the national average. Thus, while the population growth in Azerbaijan in 1990-2010 was 26.2%, the increase in the Lankaran economic region was 35.7%
2. While the average annual growth rate of the population living in the economic region declined by about 1 point in 1991-2011, compared to the indicator of Azerbaijan (1.21% in 1991 and average 1.18% in 1991-2009) 0.4 points higher. This figure was 2.53% in 1991 and an average annual increase of 1.55% in 1991-2009. The tendency to be considered important is the sharp decline in population growth in rural areas. In 1991, the Lankaran economic region was 3.12%, in 2009 it was 1.58% and fell twice. In all regions of the region, the growth rate of the rural population has dropped twice compared to the last two decades (3-5% per year).
3. Analysis of demographic data shows that at the beginning of 2010 the overall coefficient of birth and natural increase in the whole population of the region was higher than the average national level and the overall mortality rate was low. Thus, while the average natural growth rate in the country was only 11.3, this figure was 14.8 in the region. In most regions the overall coefficient of birth and natural increase is higher than in the average country and the average mortality rate is closer to the country's indicators. Although the lowest level among the administrative regions in the region is in the Lankaran region, the natural growth rates are higher than the average national level.
4. The dynamics of the rural and urban population of the region show that although urban populations are growing, the urbanization rate is lower than in 1990 (25.4%). At the same time, the decline of the urban population's share of the population since 1999-2002 is gradually compensated and this figure reached 25.0% in 2008-2011. This indicator is almost 2 times lower than the country's urbanization level.
5. Population's demographic behavior consists of basic components such as reproductive, migration and self-protection. Analysis of the population growth in the region shows that the birth rate of women is smaller than the number of male births. Thus, in 2010 54,6% of the total number of born children were born in the region, and 45,4% were girls. This indicator is lower than in some administrative regions. For example, girls born in Lankaran region accounted for 44.9 percent of the total number of births, 46.0 percent in Masalli, 45.6 percent in Jalilabad, 44.7 percent in Yardimli and 45.3 percent in Lerik region. In the world practice, based on the legitimacy of the fall of 98 girls per 100 births, there is no doubt that the level of this indicator will cause the breach of intercourse balance during the prognosis.

While determining the forecasting methodology, the component, Cohort method has the potential to consider the above conditions and trends. analyze of other methodologies - Objective consideration of the trends in forecasting and balancing on the basis of mathematical-statistical equilibrium extrapolation, and the format required for planning socio-economic development of the region (gender and age groups, urban and rural areas long-term perspective) does not allow the demographic forecast to be drawn up. Therefore, a forecast model for each year of the predicted period was developed in the distribution of sex, urban and rural areas for 5-year age groups of each region for predicting the population. Mathematical-statistical equations, based on the data for 1970-2010, were used to substantiate the level of different parameters of the model.

5. THE RESULTS OF POPULATION FORECASTING

The following three scenarios were performed on the method of demographic projection (Cohort) method of Lankaran economic region:

1. Pessimistic scenario - forecast based on low natural growth ratios in the economic region;
2. Basic scenario - a structural forecast, taking into account the observed natural growth trends and demographic waves in the economic region;
3. optimistic scenario - 10% of the structural prognosis, which predicts birth and infant mortality rates compared to the main scenario.

The results of the calculations are given in the table below:

Table 1: Number of Population at the end of the year

Years	Scenario		
	Pessimistic Scenario	Basic Scenario	Optimistic Scenario
2009	833865	837254	837304
2018	936522	979400	993361
2030	1006233	1105693	1144452

Source: author's calculations based on 2009 year census and modelling

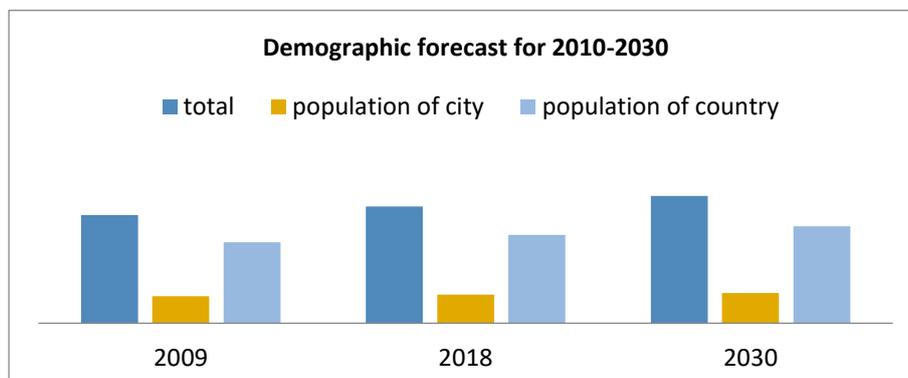

The results of the calculation of the population growth forecast for each of the three scenario were assessed and the number of population was estimated at 1105.7 thousand by the reporting year (2030). The structural elements of the forecast on the main scenario are as follows.

5.1. Number of population at the end of the year

Table 2: Number of population at the end of the year

	2009		2018	2030

6. THE USE OF DEMOGRAPHIC FORECAST

Perspective calculations require the following parities:

- Number of working-age and economically active population;
- The economically active population should take into account the defined minimum consumption norms and at the same time, the higher earnings;
- The balance of land, in particular agricultural and useful land, should be considered;
- Water - the need for drinking and irrigation water should be met;
- Energy - The need for electrical energy should be taken into account and at the same time the need to use alternative energy sources;
- Raw materials - Indicators of industrial areas using local raw materials should take into account the availability and raw materials.

One of important results of forecasting is defined as demographic waves to be occurred after 2024 years as a consequence of economic crisis of 1990-s years. Number of women in reproductive age will be less than number of men. Accordingly, disparity between male and female will led to birth rate reduction.

Source: Authors' calculations

The proposed investment program allows to increase by about 5.2 times GDP per capita in the region in the period up to 2030. At the same time, it will be possible to achieve full employment in the region and achieve a significant increase in the income of the population.

ABSTRACT

From the beginning of the 20-th century, forming the knowledge economy, creating the human capital and providing the sustainable development on basis of the development of education arrange the priorities of the economical policy in the advanced countries of the world. Some researchers show that if all other factors are constant and the portion of population having the high education in structure of economically active population grows, it will raise the labour productivities and wages of all workers including the workers having the lower education level too. In this study international research methods have been investigated for the qualitative evaluation of educational system and comparison with the achievements of other countries. Based on world countries data, authors have comparatively analyzed the indicators characterizing the welfare of population such as income and wages influenced by the education. In the study the mode of life of population, including the relationship of between the income of the population and level of their educations have been investigated through the econometric modelling. Models have been realized by means of Eviews Software on based of data for the years 1996-2017.

Keywords: *education, income, mean years of schooling, sustainable development, wages*

1. INTRODUCTION

In accordance with conception of “Human development and its measurement” emerged in the ending of XX century, it is not allowed to characterize the economic development only like as the increase in a wealth, increment in investment opportunities and financial resources. According to this theory besides humans are the means of economic progress, they are the final aim as well. If we say in other word, for living longer and healthy the purpose of development should be arranged by creating the suitable environment, providing with personal freedom and social protection, improving material and moral welfare of people. A lot of research shows that, the main reason of differences between poor countries and rich countries are based on human capital deficiencies and irrational utilisation, but not based on physical capital deficiencies. Nevertheless some countries are not able to mobilize the adequate resources for development of the education and its role in developing the society is accepted unconditionally by them. Because besides the education is an important term in forming the economic growth and national wealth, in its turn it creates the human capital.

2. SOCIAL ECONOMIC IMPORTANCE OF EDUCATION

Education is a process of transmitting the competences and skills being an important for the practical activity. According to the international definition defined by UNESCO, the education is a process of improving the skills and behaviours for intellectual maturity and personal development. As it seems the definition of education doesn't imply only formal education, i.e. teaching process at the schools and universities. The education is characterized as a stable and varied learning process. American public man and philosopher John Dewey noted in its publishing work named as "Democracy and education" in 1916 that education, in its broad sense is the means of continuity of social life. The primary ineluctable facts of the birth and death of each one of the constituent members in a social group determine the necessity of education. With the growth of civilization, the gap between the original capacities of the immature and the standards and customs of the elders increases. Mere physical growing up, mere mastery of the bare necessities of subsistence will not suffice to reproduce the life of the group. Education, and education alone, spans the gap (Dewey, 2004, pp. 2-3). Dewey's Democracy and Education shows how education can be used as a tool to transform not just the self but also the society. Here, Dewey outlines the importance of education in how we deal with the world in general (Mancenido-Bolanos, 2016, p. 85). Besides transmitting the scientific knowledge to the young generation, the education forms intellectual potential of society and state. The education provides the development of person and forms the cognitive interests and thinking and provides the preparation to the labour and social life. The positive effects of education are already accepted in fact. The education of any person has an advantage not only for himself/herself, but also the other ones with who are working and living together. There is some studies show that if the other factors stay a constant and a portion of persons having higher education grows then it will increase the productivities and wages of all employees including the employees with the level of lower education. Empiric investigations give evidence of the strong positive correlation both the between the education of parents and their heaths and between the education of parents and their children`s health. The children and infant mortality rate among the parents having higher literacy is less than that parents having lower literacy. A lot of research fulfilled by World Bank in different countries made known that there is a positive correlation between the education and democracy. So, training and teaching process provides the development of social development and strengthens the efforts in defence of people`s freedom of speech and the potential of participation in the activities of democratic institutes.

3. HUMAN CAPITAL AND COMMON WEALTH

The definition of "Human capital" is related with the name of American economist and scientist Theodore Schultz. In his studies dedicated to analyses of causes and factors of increasing the labour productivity he has characterized the human capital like as aggregate of work abilities attained and improved by humans. As to his thinking, the education transforms the human from the simple employee to the creative one. Besides the direct education expenditures of secondary and higher education, he estimated the capital investments in self training, increasing the experience in the work and as well as health, education and scientific fields as an investment in human capital (Schultz T.W., 1961). Gary Becker who had a significant contribution to the enhancement of conception of human capital in his fundamental work named as "Human Capital" pointed out that the investments in human capital not only involves the education expenditures and also the expenditures related with health and bringing up children, i.e. any expenditures raising the human`s productive force. In generally the definition of a human capital is accepted as an aggregate of skills, knowledge and social attributes, as well as individual characteristics like as creative imagination concentrated in human in the purpose of creating the economic value. The more human`s skills make the capital made by him/her become more valuable, it means that income on the such capital (salary) must be higher.

In the developed countries capital investments in human capital are admitted as the most effective expenditures for society which quickly covering itself on account of returns. Human capital is considered as one of the factors strengthening the economic potential and the economic growth in generally. In this type of approach the development is not only measured through increasing the economic growth rate, but also through human capital investment and reduction of poverty (Becker G.S., 2009). For a long time, economists have been considering the physical capital as a main part of the wealth. The results of the research fulfilled in 1995 on 192 countries by World Bank show that 24% of aggregate wealth in the world estimated in the amount of 689 trillion was physical capital; 69% of the amount was human capital (Table 1). The appropriate analyses have been carried out by 141 countries in 2018. In accordance with this analysis the common wealth in the world increased by 66% and has reached to 1143 trillion dollars in 2014 compared with 1995 (an average annual growth rate was 2.7 percent).

*Table 1: Global Wealth, by type of asset, 1995 and 2014
 (The changing wealth of nations reports, World Bank 2018, pp.47).*

	1995		2014	
	Trillion, US\$	Percent	Trillion, US\$	Percent
<i>Produced capital</i>	164,8	24	303,5	27
<i>Natural capital</i>	52,5	8	107,4	9
<i>Human capital</i>	475,6	69	736,8	64
<i>Net foreign assets</i>	-2,9	<1	-4,6	<1
<i>Total wealth</i>	689,9	100	1143,3	100

The human capital assumes the prevailing special weight in the structure of common wealth. Human capital wealth is defined as the discounted value of future earnings for a country's labour force. In other words, human capital wealth is considered to be an asset that generates a stream of future economic benefits (earnings) (World Bank, 2018, pp.47). The volume of human capital amounted to 737 trillion in year 1995, but its portion in common wealth was equal to 69%. Human capital volume increased by 55% compared with year 1995 and its portion in common wealth decreased up to 64%. Its average annual growth rate was 2.3 percent. Based on estimation of World Bank, after the year 2000 this decline in the share of human capital wealth was entirely due to upper-middle and high-income OECD countries, which together account for more than 80 percent of global wealth as well as most human capital wealth (The changing wealth of nations reports, World Bank 2018, pp.46). The volume of common wealth per capita amounted to 128929 dollars in 1995 (Table 2). This indicator increased by 30.7% and has reached to 168580 dollars in 2014 compared with the year 1995 (an average annual growth rate was 1.42 percent). In comparison with the year 1995 the human capital per capita increased by 22.2% in 2014 and has reached to 108874 dollars. In 1995 the human capital per capita was 88874 dollars and the average annual growth rate during the previous year was 1.06%. As it is shown from the table human capital consists of 2/3 part of the common wealth per capita. So, the special weight of human capital in the human capital per capita was 68.9% in 1995, but 64.4% in 2014. The scale of economy and development trends, national-mental values, resource opportunities, joint markets as well as the comparisons of countries having higher indicators in the fields of education with Azerbaijan have been given in the below table.

Table following on the next page

*Table 2: Trends in wealth per capita, 1995-2014
 (The changing wealth of nations reports, World Bank 2018, pp.123)*

	1995	2000	2005	2010	2014	Annual growth
<i>Total wealth per capita (US\$)</i>	128,929	138,064	145,891	158,363	168,580	1.42%
<i>Human capital per capita (US\$)</i>	88,874	96,478	97,707	102,170	108,654	1.06%
<i>Human capital as share of total (%)</i>	69	70	67	65	64	

The common wealth of Azerbaijan has been estimated as 813.7 milliard dollars and special weight of human capital was equalled to 14%. The common wealth per capita has been estimated 85341 dollars, but human capital volume 11961 dollars. Overall, estimates of human capital wealth per capita are closely correlated with GDP per capita. Building on the underlying growth theory, previous issues of the Changing Wealth of Nations reports measured total wealth as the present value of consumption in the national accounts. Since consumption typically accounts for 80 percent of GDP in many countries, this led to an almost perfect correlation between wealth estimates and GDP, whether in aggregate levels or per capita. Rankings of countries according to their total wealth per capita and their GDP per capita were therefore almost identical (The changing wealth of nations reports, World Bank 2018, pp. 131).

*Table 3: Total wealth and human capital, 2014
 (The changing wealth of nations reports, World Bank 2018, pp.123)*

	<i>Total wealth</i> Billion, US\$	<i>Human capital</i>		<i>Total wealth</i> per capita (US\$)	<i>Human capital</i> per capita (US\$)
		<i>Billion,</i> US\$	<i>Human capital as</i> share of total (%)		
<i>Russian Federation</i>	2714,1	1306,1	48.1	188,715	90,812
<i>Kazakhstan</i>	3127,8	1324,6	42.4	180,911	76,617
<i>Azerbaijan</i>	813,7	114,1	14	85,341	11,961

<i>Turkey</i>	3565,9	936,6	26.3	45,998	12,081
<i>Georgia</i>	165,2	79,2	47.9	44,327	21,251

3.1. Estimating the levels of education on the labour resources and employment

The education provides the young to become the active citizens and preparation of specialists raising their opportunity of finding the jobs. The results of the selective survey “On economic activity of population” conducted in our country with the technical support of International Labour Organization (ILO) show that the number of labour resources in 2017 was 7221.6 thousand persons. As it is shown in the table that 15.3% of labour resources were specialists with higher education, but 11.3% were specialists with secondary education and 5.2% - with primary vocational. There is an extreme supply of the labour forces which have no occupational competences, but full secondary education. So, 68.2% of labour resources and 67.4% of total employment do not have the primary vocational education. According to the methodology of International Labour Organization the definition of the economic activity population implies the persons supplying their labours to produce products or services, i.e. the number of employment and unemployment.

The percentage ratio of the number of economic activity population to the number of labour resources reflects the level of economic activity of the population. The level of economic activity of the population in 2017 was 70.3% (Table 4). It is shown from the table that the employment level of labour resources having the education and the primary vocational is higher than other ones. The level of the economic activity among the specialists of higher education is 75.3%, but the employment level is 95.8%. The appropriate indicators among the educated persons having secondary education are 67.1% and 94.2%, but the primary vocational education 74.3% and 93.4% accordingly.

Table 4: The main characteristics of labour market of Azerbaijan on the levels of education, 2017 (The State Statistical Committee of the Republic of Azerbaijan: Labour market (2018) Retrieved 08.12.2018 from <https://www.stat.gov.az/source/labour/?lang=en>)

	Total	High	Secondary education	Primary vocational	Upper secondary	Lower secondary	Primary	No schooling
